Matthew Kovar, a manager at the Yankee Group consulting firm who follows the networking industry, said Genuity would be free as a stand-alone company to pursue a more aggressive strategy than it would be as a local phone company unit. "It's not a change to the entire business model," he said of Genuity's plans. "But maybe these are things they felt they weren't free to do, or weren't able to do, because of the lethargic Bell operating company mentality."

Gudonis said he couldn't discuss financial specifics, including the total amount of networking investment Genuity would make, until the company files registration statements with the Securities and Exchange Commission to sell public shares. No filings are expected until the FCC clears the merger of the parent companies, he said.

Gudonis's tenure with the GTE unit dates back to 1994, when he joined Bolt Beranak as president of what then was known as its "BBN Planet" division, providing high-speed data services to individual companies. The business totalled about $5 million that year, he said; now it will generate the majority of Genuity's revenue. In addition to Internet companies, customers include Honeywell and FleetBoston Financial Corp.

Genuity also will invest heavily to upgrade its Internet backbone services so it can eventually handle the heavy demands needed to send video signals to homes via cable modems and high-speed phone lines. Clients for these services include Yahoo Inc. and General Electric's NBC Interactive, he said.

The unit is also constructing a new office park in Woburn. Gudonis said it will house 1,400 people by next year, some of whom transferred from other offices in the state.

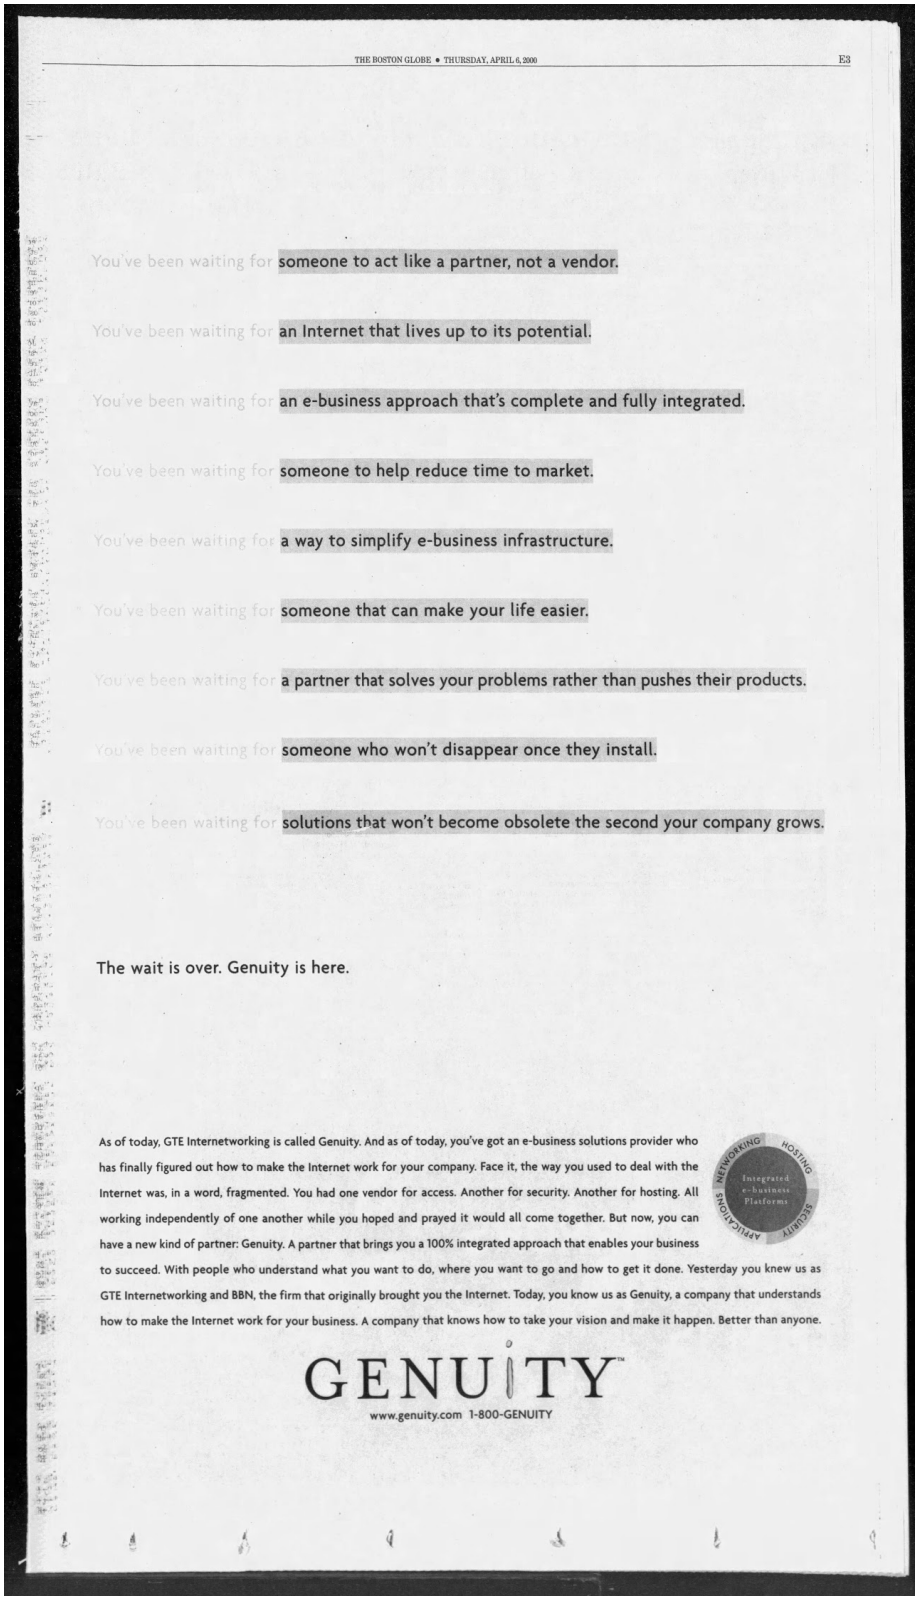
2000 (April 04) - Boston globe, advertisement for Genuity



THE BOSTON GLOBE • THURSDAY, APRIL 6, 2000 E3

You've been waiting for someone to act like a partner, not a vendor.

You've been waiting for an Internet that lives up to its potential.

You've been waiting for an e-business approach that's complete and fully integrated.

You've been waiting for someone to help reduce time to market.

You've been waiting for a way to simplify e-business infrastructure.

You've been waiting for someone that can make your life easier.

You've been waiting for a partner that solves your problems rather than pushes their products.

You've been waiting for someone who won't disappear once they install.

You've been waiting for solutions that won't become obsolete the second your company grows.

The wait is over. Genuity is here.

As of today, GTE Internetworking is called Genuity. And as of today, you've got an e-business solutions provider who has finally figured out how to make the Internet work for your company. Face it, the way you used to deal with the Internet was, in a word, fragmented. You had one vendor for access. Another for security. Another for hosting. All working independently of one another while you hoped and prayed it would all come together. But now, you can have a new kind of partner: Genuity. A partner that brings you a 100% integrated approach that enables your business to succeed. With people who understand what you want to do, where you want to go and how to get it done. Yesterday you knew us as GTE Internetworking and BBN, the firm that originally brought you the Internet. Today, you know us as Genuity, a company that understands how to make the Internet work for your business. A company that knows how to take your vision and make it happen. Better than anyone.

GTE, others play the name game

BY DENISE PAPPALARDO

LOS ANGELES — GTE Internetworking announced at Internet World 2000 last week it is changing its name to Genuity.

This development keeps the ISP in step with its parent company, GTE, which also announced that once its pending merger with Bell Atlantic is final, the joint company will be called Verizon.

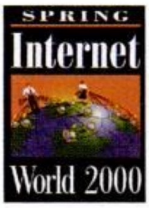
And to complete the name-game circle, Bell Atlantic Mobile and Vodafone AirTouch said last week they will call their joint wireless entity Verizon Wireless (see story, page 91).

GTE Internetworking, now Genuity, is changing its name as it prepares to become an independent company. In February, GTE and Bell Atlantic told the Federal Communications Commission they were willing to spin off GTE's ISP in order to see GTE and Bell Atlantic's merger through.

It is not known if the FCC will take them up on the offer, but the ISP is moving ahead with its plans. Paul Gudonis, president of Genuity, says the change is not dependent on the FCC's decision but is instead prompted by market shifts.

"The name change is part of an evolving strategy to take advantage of the next Internet revolution," Gudonis says. The company likes the fact that the name Genuity is a derivative of ingenuity, he says. He added some at the ISP wanted to go back to the ISP's roots and rename GTE Internetworking BBN Planet. Those folks lost out. GTE acquired BBN Planet in May 1997 and renamed the ISP GTE Internetworking four months later.

But the name Genuity is not new either. In November 1997, GTE Internetworking acquired the San Francisco Web-hosting company Genuity. By choosing a name the ISP already owned and hasn't used since the acquisition, they were able to avoid the exhaustive trademark and URL searches typically done when naming or renaming a company.



At the press conference, Gudonis also said Genuity signed a deal with Akamai to deploy Akamai's FreeFlow content-distribution servers throughout its network. Genuity will offer FreeFlow services in addition to its current content-distribution services, which are based on Inktomi servers and Genuity's Hopscotch load-balancing technology.

In other Internet World news:

- Akamai introduced its Traffic Analyzer and Reporter tools that offer FreeFlow content-distribution customers real-time and historical information on Web site performance.
- Sprint announced it is offering Microsoft Windows 2000 Advanced Server and Site-Server Commerce Edition Web hosting services to business customers. Win 2000 Advanced Server includes Microsoft SQL Server 7.0, which is used for advanced cataloging and database storage.

TECHNOLOGY & INNOVATION

Genuity's plan to raise $2.6b in IPO would be largest by ISP

BLOOMBERG NEWS

WASHINGTON – Genuity Inc., the pioneering Internet unit of GTE Corp., said its planned initial public offering could raise as much as $2.6 billion, making it the largest ever for a US Internet service provider.

GTE, a local phone service provider based in Irving, Texas, is selling 90.5 percent of Genuity, whose Internet roots date back to the sending of the first e-mail.

GTE is making the sale so regulators will allow it to be bought by Bell Atlantic Corp. and form the biggest US local phone company under the name Verizon Communications. Bell Atlantic said yesterday it expects to complete the purchase next month.

Burlington, Mass.-based Genuity first filed for the IPO last month without specifying the number of shares being sold or the price being sought.

"It's obviously a very large deal, and it's unclear in this type of environment how willing the market will be to swallow something of this size," said Darren Chervitz, a money manager at Jacob Asset Management in New York.

Genuity said it plans to sell 173.9 million Class A common shares for between $12 and $15 each, raising between $2.1 billion and $2.6 billion before expenses. At the $13.50 midpoint of the expected price range, the stock sale would be worth $2.3 billion, according to Genuity's amended IPO filing to the Securities and Exchange Commission.

At the top of the expected price range, Genuity would rank as the ninth-biggest IPO in US history and the largest ever for a US Internet service provider. Among worldwide Internet IPOs, Genuity would likely rank behind Germany's T-Online International AG, which raised $2.8 billion last month, Chervitz said.

The value of Internet stocks and IPOs have fallen in recent months. Since March 10, the Bloomberg US Internet index has dropped by more than half, from 301.78 to 137.64, while the Bloomberg IPO Index has sunk from 2415.11 to 1007.47.

Genuity said it plans to use $1.8 billion of the funds being raised to expand its network, which makes up part of the mesh of wires that connect computers around the world and are referred to as the backbone of the Internet. The rest of the IPO proceeds would be available for other general purposes, which could include acquisitions, although none are in the works now, the filing said.

The IPO funds would represent only a part of the company's capital spending plan to expand its network infrastructure at the cost of $11 billion to $13 billion between 1999 and 2004. Genuity plans to spend $1.8 billion to $2 billion on the project this year, according to the filing.

The entire company, with 192.2 million shares to be outstanding immediately after the IPO, would have a market value of between $2.3 billion and $2.9 billion at the IPO price range. At the midpoint, Genuity would be valued at $2.6 billion.

The combined GTE and Bell Atlantic hold about 18.3 million Class B common shares, giving them 9.5 percent in Genuity following the IPO. Those shares would be worth between $219.1 million and $273.8 million, at the $12-15 per share price range. At the $13.50 midpoint, the stake would be worth about $246.5 million.

Under their proposal to regulators, the companies could convert their Class B shares – which are largely identical to the publicly traded Class A – into 800 million Class C common shares, which get five votes each versus one apiece for the other classes. The conversion would give Bell Atlantic and GTE an 82 percent equity stake and 96 percent voting control over Genuity, the filing said.

The companies could make the swap if they permit competition from other companies within Bell Atlantic's local phone markets in 12 states, by an unspecified date in 2005. Bell Atlantic's 13th state, New York, already is open. US law forbids a local carrier from providing long-distance service – including Internet access – in states where it hasn't completed steps to allow local competition, according to the filing.

Bell Atlantic plans an IPO this year for another of its businesses, Verizon Wireless, which is a joint venture with Vodafone AirTouch PLC.

GTE shares rose 37.5 cents to close at $60.625, after reaching as high as $61.50 in late afternoon trading.

[HN01F6][GDrive]

2000 (June 19) - RCRWireless article - Verizon gets green light ; The FTC approves transfer of GTE Corp.'s communications licenses to Bell Atlantic Corp

See [HW005C][GDrive] - By Reily Gregson on JUNE 19, 2000Archived Articles

WASHINGTON-The Federal Communications Commission late Friday approved the transfer of GTE Corp.'s communications licenses to Bell Atlantic Corp. contingent on 25 conditions, including putting some wireless properties into a trust until they can be sold so as to not violate cellular cross-ownership rules.

"There will be those that will claim this merger brings us closer to a re-emergence of Ma Bell, however, my support is predicated on the applicants' enforceable commitments to open its traditional local markets to competitors, invest in new markets and accelerate deployment of broadband technologies. The end result should produce more competition, not less," said FCC Chairman William Kennard.

"This is a great day for Bell Atlantic and GTE, for our customers, our investors and our employees … This final approval contains reasonable conditions that clear the way to unite these two great companies into Verizon Communications," said Charles R. Lee, chairman and chief executive officer of GTE and designated chairman and co-CEO of the new company. The merger is expected to close by June 30.

Bringing GTE's wireless holdings into Verizon Wireless-the mobile-phone company consisting of Bell Atlantic Mobile, PrimeCo and Vodafone AirTouch plc-would create the nation's largest wireless company, with more than 24 million customers and a footprint covering 90 percent of the United States.

"Our ability to deliver a full plate of voice, data, Internet and wireless services to all our customers will make Verizon the next great brand in communications," said Ivan Seidenberg, chairman and CEO of Bell Atlantic and designated president and co-CEO of Verizon.

Bell Atlantic and GTE obtained Department of Justice approval after selling off overlapping wireless properties. Some of the sales were made in a multiproperty deal with Alltel Corp., which was approved by the FCC's Wireless Telecommunications Bureau last week.

One of the major conditions on the transfer involves GTE's Internet backbone, operation of which would violate the Telecommunications Act of 199

To get around the telecom act's prohibition against regional Bell operating companies offering long-distance services, Bell Atlantic and GTE proposed, and the FCC accepted, spinning off the Internet backbone into a new entity called Genuity.

Verizon would have a 9.5 percent interest in Genuity until Verizon is granted long-distance authority in the former Bell Atlantic states. Bell Atlantic has received such authority in New York but still has 12 states and the District of Columbia to go. Once approval has been obtained, Verizon would then be permitted to control up to 80 percent of Genuity. If approval is not granted for at least 50 percent of the old Bell Atlantic territory within five years, the conversion to 80-percent stock would evaporate.

Seidenberg said he expects long-distance approval within two years from the close of the merger.

This arrangement satisfied FCC Commissioner Susan Ness, who said approving the merger was "a close call."

Both Republican members of the commission partially dissented in the approval because of the conditions placed on it.

"None of the shortcomings I address here or in my previous statement on these issues will ever be addressed unless the commission begins to reform the majority's `balancing approach' to merger review that we apply again here, or seriously question the aforementioned specious theories of potential harm," said FCC Commissioner Michael Powell.

FCC Commissioner Harold Furchtgott-Roth also dissented because he does not believe the commission should be involved in regulating undersea cable licenses. This is one of the approvals the FCC granted.

Amid concerns that someone might challenge the license transfers, the companies said they believe the approval with conditions can withstand any court challenge.

"We think this arrangement is bullet proof. We believe we have the best lawyers and best consultants that one could have … We don't think there is a minuscule chance that this would be overturned," said Lee.

Fate of WorldCom/Sprint

Internet issues also may derail WorldCom Inc.'s hopes of marrying Sprint Corp. and gaining control of Sprint PCS.

Sprint Chairman William Esrey told shareholders last week at the company's annual meeting in Westwood, Kan., that some Justice Department staff do not support the merger.

"We have had a number of high-level meetings with [DOJ] officials in recent weeks, but it remains unclear if we will or will not get the necessary government clearances to implement the merger," Esrey said.

WorldCom needs the merger to fill in the large wireless gap in its offerings. Sprint needs to expand its international reach. Both companies would benefit from combining their fixed-wireless assets.

While DOJ seems concerned with the antitrust implications of a merger between the nation's No. 2 and No. 3 long-distance companies, the European Commission is concerned about WorldCom's dominance of the Internet. Experts believe WorldCom is willing to sell off Sprint's Internet backbone but not its stake in UUNet.

Similar concerns when WorldCom bought MCI Communications Corp. led to the sale of some of WorldCom's assets to Cable and Wireless plc. This sale was not successful and experts believe the EC does not want to create a repeat situation.

The EC is scheduled to make a decision by July 12

Should WorldCom/Sprint convince DOJ and EC officials that the merger would create an all-distance company in an all-distance telecommunications market, the company still must receive FCC approval to transfer its licenses.

Business Nation/World

A revamped Verizon gets competitive, cuts price of DSL service 20%

But coverage limited, lags speed of cable offerings

By Peter J. Howe
GLOBE STAFF

Bell Atlantic marked its transformation to Verizon Communications yesterday with a gift for its high-speed Internet customers: a 20 percent cut in the price of its basic home digital subscriber line service.

Verizon, formed from the merger of Bell Atlantic and GTE, said both current and future customers for its 640-kilobit-per-second service will now pay $40 a month instead of $50, as under previous plans, plus $100 for a modem.

The $10 reduction makes DSL more competitive with cable modem services, such as AT&T Broadband, which holds a big lead over Verizon DSL in Massachusetts and several of the other 31 states where Verizon has a local landline presence.

However, the maximum 640-kilobit download speed is still only 40 percent as fast as the maximum offered by AT&T Broadband, and DSL is unavailable to people who live more than about two miles from a phone company "central office" outfitted with the requisite gear. Roughly half of Massachusetts central offices have been upgraded for DSL.

"We still have a quality product, and for $10 more, you get twice the speed," said AT&T spokesman Richard D. Jenkinson. In Massachusetts and New Hampshire, the 1.5-megabit AT&T RoadRunner service can be had for as low as $30 a month for people who buy the modem rather than renting and also take cable TV.

The DSL price cut announcement capped a day of nationwide festivities launching the new Verizon brand name, which combines companies that employ 260,000 people around the world and becomes the largest local US phone company ahead of SBC Communications.

The name comes from a combination of the word "horizon" with "veritas," the Latin word for truth.

Verizon officials said their service area includes 16.5 million households that potentially could receive DSL, of whom barely 1 percent are estimated by industry analysts to have the service now.

The company's local landline reach combines the Bell Atlantic Maine-to-Virginia base with GTE's scattered local franchises in 28 states. Key GTE local service areas include metropolitan areas of Dallas, Los Angeles, Tampa, Raleigh-Durham, N.C., and Seattle and the state of Hawaii and Puerto Rico.

GTE and Bell Atlantic have also spun out their wireless properties into Verizon Wireless, which covers 96 of the top 100 US markets and has 29 million wireless and paging customers.

In a Boston interview yesterday, Verizon vice chairman and copresident Michael T. Masin said the company expects to take several steps to close "small gaps in our domestic footprint," which could include efforts to lease other Baby Bells' lines to compete with them for local residential and business service.

As a condition of federal approval for the merger, GTE had to spin off most of its stake in Genuity of Burlington, the former GTE Internetworking, a top Internet backbone carrier.

However, Masin said, "We think within two or three years Genuity will be back in the fold of the Verizon family." To be allowed to take back majority control of Genuity, Verizon must get approval to be a long-distance phone carrier throughout the former Bell Atlantic states.

Earlier this year Bell Atlantic cleared that hurdle in New York and quickly grabbed nearly 1 million long-distance customers. Last week US regulators approved SBC as a long-distance carrier in Texas.

Masin said he believes those steps have laid out a clear road map for how Baby Bells must open their networks for local competition to get approval as long-distance carriers. "We think we will do it" in all Bell states "within two to three years, and we think the next one to do it will be Massachusetts" before year's end.

Verizon shares fell 62.5 cents to $58.8125.

2002 (July 26) - NYTimes - "Genuity Faces Bankruptcy As Verizon Ignores an Option"

By Seth Schiesel With Simon Romero ; See [HN01C4][GDrive] ;

This article is also located at [**Verizon Communications Incorporated**]

Genuity [(Genuity Incorporated (2000))], the last of the original Big Three Internet carriers, may be about to go the way of its competitors -- into bankruptcy.

[Verizon Communications Incorporated], the No. 1 local phone company, said yesterday that it would not rescue **Genuity** from the telecommunications and technology vortex by taking control of the company.

Verizon, which spun off **Genuity [(Genuity Incorporated (2000))]** two years ago, had been expected to reassume control of the company by June 2005, under terms of the spinoff

Yesterday's announcement sent Genuity's stock plummeting by 89 percent to close at 29 cents, pushed Genuity into default on $3 billion in loans and raised the possibility that the company might have to file for bankruptcy protection within months. If that happens, Genuity would take its place alongside WorldCom's UUNet division and PSINet as former highflying Internet "backbone" companies operating under bankruptcy protection.

A sharp sell-off of Genuity's shares on Wednesday -- otherwise the best day for stocks in 15 years -- suggested that some traders might have had advance warning of yesterday's announcement. Certainly, the Wall Street grapevine may have known something was afoot: **Genuity [(Genuity Incorporated (2000))]** revealed yesterday that on Monday, it had drawn down $723 million from a prior credit line with eight banks.

But Genuity said yesterday that it had no idea that Verizon was planning to drop its option when Genuity called on the banks Monday. "This is absolutely coincidental from our standpoint," Susan Kraus, a Genuity spokeswoman, said yesterday. "We had absolutely no knowledge of what Verizon was going to do."

As the Internet came to popular attention in the early 1990's, three companies emerged as the leading carriers of Internet data: Uunet, PSINet and Genuity's predecessor, BBN. As telephone companies expanded into data networking in the 1990's, they were eager to acquire those early pioneers. Although PSINet remained independent, [**UUNET Technologies, Incorporated**] was acquired by [**MFS Communications Company, Incorporated**] shortly before MFS was acquired by **WorldCom** [, which later became MCI WorldCom Corporation,] in 1996. GTE acquired BBN in 1997 and later renamed it Genuity.

When Bell Atlantic acquired GTE in 2000, creating Verizon, the combined company spun off 90 percent of Genuity as a condition for winning regulatory approval for that deal. Bell Atlantic was not allowed to control Genuity because Bell Atlantic was not then allowed to sell long-distance communications services, including data networking.

But Verizon accurately anticipated that it would win the necessary long-distance approval within a few years. So, when it spun off most of Genuity to public shareholders in 2000, it retained the ability to reassume control of Genuity by mid-2005.

Until recently, many investors expected that Verizon would assert its option, given that Genuity had grown from $183 million in revenue in 1997 to $1.2 billion last year.

Genuity's losses, however, have also grown. Were Verizon to reacquire control of Genuity, it would also have to consolidate Genuity's $3 billion in debt and its annual losses -- $4 billion last year -- into its own financial statements.

Already jittery about the state of the regional Bell companies, investors were loath for Verizon to make that move. As a result, Verizon said yesterday that it would not. Now, Verizon appears to believe that it can get into the long-distance data communications business without assuming Genuity's baggage

Given the stock movement on Wednesday, the most important outstanding questions are about just when Verizon made that decision and when Verizon told Genuity.

On Wednesday, as the Dow Jones industrial average soared by nearly 489 points, Genuity's shares plunged by 26 percent, to $2.59, from Tuesday's close of $3.50. Peter Thonis, a Verizon spokesman, said yesterday that Verizon did not tell Genuity about its decision until after the stock market closed on Wednesday.

As for **Genuity [(Genuity Incorporated (2000))]**, the question is why it rushed to borrow $723 million on Monday.

Genuity said yesterday that the group of eight banks really should have been nine and that the $723 million really should have been $850 million. Genuity said Deutsche Bank refused to honor a commitment to lend it an additional $127 million, and that it had sued Deutsche Bank in Federal Court in Massachusetts.

Deutsche Bank said that it had not received any legal papers and that it was in talks with Genuity.

People close to Genuity's lenders said yesterday that Genuity called its banks on Monday morning and demanded the money remaining under its prior credit line by noon that day. Some banking executives said yesterday that companies generally were prepared to wait 48 hours before actually receiving cash under a credit line. They speculated that Deutsche Bank could have been unnerved by the unusually urgent nature of Genuity's request.

Ms. Kraus, the Genuity spokeswoman, said Genuity's agreement with its lenders allowed the company to draw on its loans quickly.

Some bankers speculated yesterday that the eight other banks that did comply might have inferred that Genuity was worried about Verizon's intentions. Moreover, according to people close to both Genuity and Verizon, Michael T. Masin, a Verizon vice chairman and Genuity board member, was asked not to attend a Genuity board meeting on Sunday. His exclusion could have fueled a perception that Genuity suspected that Verizon would cut it loose soon.

2002 (Jul 26) - Forbes - "Genuity Is Left On The Launching Pad"

See [HP004D][GDrive]

This article is also located at [**Verizon Communications Incorporated**]

Genuity [(Genuity Incorporated (2000))] introduced itself to a puzzled public two years ago with an ad campaign that featured a mysterious-looking black rocket and a very 1990s tagline: "Do you want to change the world?" But the '90s, alas, had just ended, and the world had already changed--and not for the better, if you were a tech investor.

Now Genuity and its rocket appear headed for the auction block. Irony abounds in the situation, for Genuity descends from BBN, the firm that pretty much built the original Internet. The firm's current travails offer yet another sad illustration of the Moses syndrome, in which the visionary genius who points the way to the promised land fails to make it there himself.

Genuity [(Genuity Incorporated (2000))] operates a major Internet backbone network. The firm started touting its Black Rocket network services platform with that ad campaign in late 2000, just as the Internet stock market boom was collapsing. Genuity remained unprofitable, and investors abandoned this stock en masse on July 25, after Verizon Communications cut the lifeline that theoretically had tethered Genuity to its former corporate parent.

Verizon on July 24 effectively relinquished its right to reacquire a controlling interest in **Genuity [(Genuity Incorporated (2000))]**. That decision pushed Genuity into default on some of its credit agreements. The next day its shares fell almost 90%, to 29 cents from $2.59, and although it was back up over 50 cents today in afternoon trading, the stock has been cut to a rare "sell" rating by at least one Wall Street analyst. Genuity Chairman PaulGudonisPaul Gudonis was reduced to talking up his "valuable set of assets," which is the verbal equivalent of hanging a "for sale cheap" sign on the front door.

"Now that Verizon has elected not to reintegrate Genuity, we will evaluate all our options, which could include seeking another strategic partner or restructuring our operating plan while we address this situation," Gudonis said in a statement expressing disappointment with Verizon's decision.

BBN--originally Bolt, Beranek and Newman--was founded in Cambridge, Mass., in 1948 by professors from the Massachusetts Institute of Technology. Then in 1960, BBN employee J.C.R.LickliderJ.C.R. Licklider famously forecast the Internet with his seminal "Man-Computer Symbiosis" paper. It was BBN that built the ARPANET, the Internet's forerunner; it was BBN's RayTomlinsonRay Tomlinson who invented e-mail, which soon composed the bulk of the Internet's traffic. So it made sense that BBN would end up a major Internet backbone firm. In 1997 it was acquired by GTE in a deal valued at $616 millio

A few months later, GTE bought a Bechtel Enterprises unit called Genuity [(Genuity Incorporated (2000))] and combined it with BBN. Then in 2000, GTE merged with Bell Atlantic to form Verizon. The Internet network had to be spun off, because a Baby Bell was not allowed to be in the long-distance data business. But Verizon retained an option, if certain conditions were met, to reabsorb Genuity. The general expectation was that Verizon one day would exercise that option, which is why this week's announcement to the contrary left the spinoff gasping for life.

With WorldCom already in Chapter 11 proceedings, its UUNet Internet backbone unit presumably is being shopped around. Now Genuity too is up for grabs--and with it, the storied BBN legacy. It's one thing to invent the Internet, it seems, and quite another to figure out how to make it pay.

2002 (Nov 27) - NetworkWorld - Level 3 to buy bankrupt Genuity's assets

Stephen LawsonBy Stephen Lawson ; See [HP004I][GDrive]

This article is also located at [**Verizon Communications Incorporated**]

Internet backbone provider [**Level 3 Communications, Incorporated**] has agreed to acquire the bulk of the assets of network provider **Genuity [(Genuity Incorporated (2000))]**, which has filed for bankruptcy, the companies announced Wednesday.

Level 3 will pay as much as $242 million in cash and assume a significant portion of Genuity's long-term operating agreements, according to a statement from the companies. The deal must be approved by regulatory agencies and a bankruptcy court and is expected to close in the first quarter of 2003.

Also Wednesday, **Genuity [(Genuity Incorporated (2000))]** filed voluntary petitions for reorganization under Chapter 11 of the U.S. bankruptcy code, the statement said. The cash on Genuity's balance sheet, together with Level 3's cash payment, will be distributed to creditors of Genuity.

Based in Woburn, Mass., **Genuity [(Genuity Incorporated (2000))]** was spun out of U.S. telecommunications carrier [**Verizon Communications Incorporated**] according to the terms of the merger of Bell Atlantic and [**GTE Corporation**] that created Verizon in 2000. More recently, the company has been suffering financially amid a glut of capacity on backbone networks. In May, Genuity announced that it would cut as much as 30 percent of its workforce, or 1,200 jobs.

[**Level 3 Communications, Incorporated**], in Broomfield, Colorado, will acquire Genuity's network transport business as well as its dedicated and dial-up Internet access operations. It also will take over Genuity's managed services business, which it will combine with its iStructure subsidiary but continue to operate under the Genuity brand.

Genuity's biggest customers are Verizon and AOL, according to the statement. Verizon has executed a new multi-year contract to buy wholesale dial-up, transport and other services from Level 3, which should take effect when the acquisition closes.

2002 (Nov 27) - "Level 3 to acquire Genuity assets and operations for $242 million"

Source - LightWaveOnline - [HW005H][GDrive]

This article is also located at [**Verizon Communications Incorporated**]

[**Level 3 Communications, Incorporated**] and **Genuity Inc. [(Genuity Incorporated (2000))]** announced today that they have signed a definitive agreement under which Level 3 will acquire substantially all of the assets of the Massachusetts-based communications company.

[**Level 3 Communications, Incorporated**] will pay up to $242 million in cash and assume a significant portion of existing long-term operating agreements to acquire Genuity's assets and operations. To facilitate the transaction, **Genuity [(Genuity Incorporated (2000))]** today is filing voluntary petitions for reorganization under Chapter 11 of the Bankruptcy Code. Level 3's cash consideration at closing could be reduced subject to certain material adjustments.

Closing is expected to occur during the first quarter of 2003. The transaction is subject to approval by the bankruptcy court and certain government regulatory agencies.

"This transaction represents the best outcome for the key constituencies of both Genuity and Level 3," contends Paul R. Gudonis, chairman and chief executive officer of Genuity. "Both companies, as well as Genuity's largest customers and creditors, have signed agreements supporting the transaction."

"There is a unique and compelling fit between Genuity and Level 3," adds [**James Quell Crowe (born 1949)**], Level 3's chief executive officer. "The transaction combines the assets and operations of Genuity, the company that helped invent the Internet, with Level 3, the company that built the first network fully optimized for Internet Protocol-based communications. Both companies are experienced providers of optical and IP-based services, and both are Tier 1 Internet backbone providers with industry-leading quality of service. Genuity's transport and dedicated and dial-up Internet access business--more than 80 percent of revenue--is complementary to Level 3's transport, managed modem and IP services business."

Based in Woburn, MA, **Genuity [(Genuity Incorporated (2000))]** operates an international IP network. The company provides dial-up and dedicated Internet access, transport, managed security and VPN, hosting and other services to communications companies, enterprises and government agencies. Its largest customers are Verizon Communications and America Online, which accounted for greater than 60 percent of its $223 million in revenue for the third quarter of 2002.

All but one of Genuity's banks have signed an agreement in support of the transaction. Verizon has executed a new multi-year contract to purchase wholesale dial-up, IP, transport and other services from Level 3, to take effect when the transaction closes. America Online has signed an agreement consenting to the transaction that contemplates [**Level 3 Communications, Incorporated**] acquiring America Online's network services agreement with Genuity. In addition, Allegiance Telecom Inc., Genuity's largest network supplier, supports the transaction.

As part of this transaction, Level 3 is also acquiring Genuity's managed services business and its associated enterprise customers and product set. "We recognize the importance of these customers and are committed to ensuring they receive the highest quality service without disruption," asserts Kevin O'Hara, president and chief operating officer of Level 3. "As a result, we plan to combine these operations with those of our (i)Structure subsidiary in order to focus on the needs of those customers. That new managed services operating company will do business under the name 'Genuity,' a recognized leader in that market." [...]

2003 (Aug 19) - CenturyLink corporate news - Level 3 to Sell Midwest Fiber Optic Network Acquired in Genuity Transaction

See [HC004L][GDrive]

This article is also located at [**Verizon Communications Incorporated**]

BROOMFIELD, Colo., Aug. 19 /PRNewswire-FirstCall/ -- [**Level 3 Communications, Incorporated**] announced today that it has signed a definitive agreement to sell the **Midwest Fiber Optic Network (MFON)**, a regional communications system it acquired through its recent transaction with **Genuity [(Genuity Incorporated (2000))]** .

CenturyTel (NYSE: CTL) will purchase the stand-alone system, which serves as a regional backbone for a number of carriers, including CenturyTel itself, in Arkansas, Missouri and Illinois. The purchase price is approximately $17 million in cash, subject to adjustments including date of closure and system revenue at time of close. Closing is subject to regulatory approvals and customary conditions.

"This is a non-core asset for Level 3," said Sunit Patel, Level 3's chief financial officer. "While MFON currently generates approximately $1.5 million a month in revenue, the geography and architecture of the system do not offer us a practical or cost-effective way to integrate its operations into the Level 3 network. As such, we believe it makes sense to sell this business and continue to focus on the integration of the core assets, customers and traffic from the Genuity transaction."

Closing is expected to occur by the end of the fourth quarter of 2003.

Daniels & Associates, the Denver-based media and telecommunications mergers and acquisitions specialist, served as financial advisor to Level 3 on this transaction.

- **About Level 3 Communications :** Level 3 (Nasdaq: LVLT) is an international communications and information services company. The company operates one of the largest Internet backbones in the world, is one of the largest providers of wholesale dial-up service to ISPs in North America and is the primary provider of Internet connectivity for millions of broadband subscribers, through its cable and DSL partners. The company offers a wide range of communications services over its 22,500-mile broadband fiber optic network including Internet Protocol (IP) services, broadband transport, colocation services, and patented Softswitch-based managed modem and voice services. Its Web address is www.Level3.com. The company offers information services through its subsidiaries, (i)Structure and Software Spectrum. For additional information, visit their respective web sites at www.softwarespectrum.com, and www.i-structure.com.
- **About CenturyTel :** CenturyTel, Inc. provides communications services including local, long distance, Internet access and data services to more than 3 million customers in 22 states. The company, headquartered in Monroe, Louisiana, is publicly traded on the New York Stock Exchange under the symbol CTL, and is included in the S&P 500 Index. CenturyTel is the 8th largest local exchange telephone company, based on access lines, in the United States. Visit CenturyTel at www.centurytel.com.

Dr. Lawrence K. Gershwin

National Intelligence Manager/National Intelligence Officer for Space and Technical Intelligence

Office of the Director of National Intelligence

Dr. Gershwin received a B.S. in physics from the California Institute of Technology in 1963 and a Ph.D. in physics from the University of California, Berkeley in 1969.

After serving as a postdoctoral associate at Columbia and Stanford Universities from 1969 to 1972, he joined the Institute for Defense Analyses, where he worked on several studies for the Department of Defense on advanced technology systems for conventional and nuclear warfare. He was with the Rand Corporation from 1975 to 1979, performing studies for the Department of Defense on land warfare systems, strategic conflict analysis, and Soviet strategic force operations. He was in the Office of the Secretary of Defense, Program Analyses and Evaluation, from 1979 to 1981, with responsibilities in strategic force analysis, arms control, and net assessments.

Dr. Gershwin served as National Intelligence Officer for Strategic Programs from October 1981 to June 1994, supporting the Director of Central Intelligence. He chaired the preparation of National Intelligence Estimates and other Intelligence Community products, with responsibilities for strategic forces, proliferation, nuclear weapons security, strategic arms control monitoring, and space. He led the preparation of the annual assessment of Soviet strategic forces, the NIE 1 1-3/8 series, and the preparation ofNIEs on our capability to monitor the INF, START and nuclear testing treaties. He regularly conducted briefings for senior policymakers, military officials, and Congressional audiences.

He has served as National Intelligence Officer for Science and Technology since June 1994 preparing Intelligence Community products in many foreign science and technology areas. In October 2010, he was appointed as the National Intelligence Manager for Science and Technology, in addition to his duties as NIO/S&T. In 2014, Dr. Gershwin's title changed from NIM/NIO for S&T to NIM/NIO for Space and Technical Intelligence (S&TI).

He is currently responsible for analytic production, collection efforts, and the status and health of IC efforts in the following areas:

- Space and Counterspace Issues
- Global Science and Technology Developments
- Foreign Denial and Deception
- Underground Facilities
- Unconventional Current and Future Technical Collection Capabilities

While serving as National Intelligence Officer, he has received the awards of Distinguished Officer and Meritorious Officer in the Senior Intelligence Service. In 1989 he received the Distinguished Intelligence Medal, and in 1996 he received the National Intelligence Medal of Achievement. In October 2010 he received the AFCEA Charlie Allen Award for Intelligence Service. In 2013 he received the Meritorious Presidential Rank Award.

Carlos Ghosn (/ɡoʊn/;[1] French: [kaʁlɔs ɡon]; Arabic: كارلوس غصن; Lebanese Arabic pronunciation: ['kaːrlos 'ɣosˤn], born 9 March 1954) is a Brazilian-born businessman. Ghosn also holds French and Lebanese nationality.[2] As of January 2020,[3] he is an internationally wanted fugitive.[4] Ghosn has served as the CEO of Michelin North America, Chairman and CEO of Renault, chairman of AvtoVAZ, Chairman and CEO of Nissan, and Chairman of Mitsubishi Motors.[5][6][7] Ghosn was also Chairman and CEO of the Renault–Nissan–Mitsubishi Alliance, a strategic partnership among those automotive manufacturers through a complex cross-shareholding agreement. The venture has held approximately 10% of the total market share since 2010, and as of 2017, was understood to be the largest automobile group worldwide.

In 1996, Renault's CEO Louis Schweitzer hired Ghosn as his deputy and charged him with the task of turning the company around from near bankruptcy. Ghosn elaborated a plan to cut costs for the period 1998–2000, reducing the workforce, revising production processes, standardising vehicle parts and pushing the launch of new models. The company also undertook major organisational changes, introducing a lean production system with delegate responsibilities inspired by Japanese systems (the "Renault Production Way"), reforming work methods and centralising research and development at its Technocentre to reduce vehicle conception costs while accelerating such conception.[8] Ghosn became known as "Le Cost Killer".[9] In the early 2000s, for orchestrating one of the auto industry's most aggressive downsizing campaigns and spearheading the turnaround of Nissan from its near bankruptcy in 1999, he earned the nickname "Mr. Fix It".[10]

Following the Nissan financial turnaround, in 2002 *Fortune* awarded him Asia Businessman of the Year.[11][12] In 2003 *Fortune* identified him as one of the 10 most powerful people in business outside the U.S.,[13] and its Asian edition voted him Man of the Year.[14] Surveys jointly published by the *Financial Times* and PricewaterhouseCoopers named him the fourth most respected business leader in 2003,[15] and the third most respected business leader in 2004 and in 2005.[16][17] He quickly achieved celebrity status in Japan and in the business world,[18][19] and his life has been chronicled in Japanese comics.[20]

Ghosn stepped down as CEO of Nissan on 1 April 2017, while remaining Chairman of the company.[21] He was arrested at Tokyo International Airport on 19 November 2018, on allegations of under-reporting his salary and gross misuse of company assets.[22][23] On 22 November 2018, Nissan's board made a

unanimous decision to dismiss Ghosn as Nissan's Chairman, effective immediately. [24][25] Mitsubishi Motors' executive board took similar action on 26 November 2018.[26][27] Renault and the French government continued to support him at first, presuming him innocent until proven guilty.[28] However, they ultimately found the situation untenable and Ghosn was made to retire as Chairman and CEO of Renault on 24 January 2019.[29] While out on bail granted in early March, Ghosn was re-arrested in Tokyo on 4 April 2019, over new charges of misappropriations of Nissan funds.[30] On 8 April 2019, Nissan shareholders voted to oust Ghosn from the company's board.[31] He was released again on bail on 25 April.[32] In June, Renault uncovered 11 million euros in questionable expenses by him, leading to a French investigation and raids.[33][34][35] With help from an American private-security contractor, Ghosn fled from Japan to Lebanon on 30 December, via private jet, breaking his bail conditions.[36] On 2 January 2020, Interpol issued a red notice to Lebanon seeking Ghosn's arrest.[37]

Early life and education[edit]

Ghosn's grandfather was Bichara Ghosn, a Maronite Catholic who emigrated from Ajaltoun,[38] French Mandate Lebanon to Brazil at the age of 13, eventually settling in remote Guaporé, Rondônia, near the border between Brazil and Bolivia.[39] Bichara Ghosn was an entrepreneur and eventually headed several companies, in businesses including the rubber trade, the sale and purchase of agricultural products, and aviation.[40] His son Jorge Ghosn married Rose Jazzar, a Nigerian-born Lebanese woman[41] whose family came from Miziara in Lebanon then went to Brazil,[38] where they settled in Porto Velho, the state capital of Rondônia, and had four children.[42]

Carlos' father, Jorge Ghosn (died 2006) was a diamond trader and worked in the airline industry. Jorge was convicted of murdering a priest in Sawfar, Lebanon in 1960.[43] Jorge fled to Brazil in 1975 at the outbreak of Lebanese Civil War.[44][45]

Carlos Ghosn was born on 9 March 1954, in Porto Velho.[42][46][47] When he was about two years old he became sick after drinking unsanitary water, and his mother moved with him to Rio de Janeiro.[42] He did not fully recover there, and in 1960, when Ghosn was six years old, he and his mother and sister moved to Beirut, Lebanon, where his grandmother and two other sisters lived.[42]

Ghosn completed his secondary school studies in Lebanon, at the Jesuit school Collège Notre-Dame de Jamhour. He then completed his classes préparatoires in Paris, at the Collège Stanislas and the Lycée Saint-Louis.[48] He graduated as an engineer from the École Polytechnique in 1974 and the École des Mines de Paris in 1978.[46][49][50]

Career[edit]

Michelin[edit]

Carlos Ghosn answers reporters' questions at the Nissan factory in Kyushu, Japan. (September 2011)

After graduation in 1978, Ghosn spent 18 years at Michelin, Europe's largest tire maker, initially training and working in several plants in France and Germany.[46][51] In 1981, he became plant manager in Le Puy-en-Velay, France.[46][52] In 1984 he was named head of research and development for the company's industrial tyre division.[46][53]

In 1985, when Ghosn was 30 years old, he was appointed chief operating officer (COO) of Michelin's South American operations.[46][54] He returned to Rio de Janeiro, reporting directly to François Michelin, who tasked Ghosn with turning around the operation, which was unprofitable and struggling under Brazil's hyperinflation.[54][55] Ghosn formed cross-functional management teams to determine best practices among the French, Brazilian, and other nationalities working in the South American division.[56] The multicultural experience in Brazil formed the basis of his cross-cultural management style and emphasis on diversity as a core business asset.[56][57] "You learn from diversity ... but you're comforted by commonality", Ghosn has said.[58] The division returned to profitability in two years.[56][59][60]

After turning around Michelin's South American operations, Ghosn was appointed president and COO of Michelin North America in 1989, and moved to Greenville, South Carolina, with his family.[61] He was promoted to CEO of Michelin North America in 1990.[56][61] He presided over the restructuring of the company after its acquisition of the Uniroyal Goodrich Tyre Company.[46][62]

Post-privatisation Renault[edit]

In 1996, Ghosn became executive vice president in charge of purchasing, advanced research, engineering and development, powertrain operations, and manufacturing at Renault; and he was also in charge of Renault's South American division, located in the Mercosur.[46][63] Ghosn's radical restructuring of Renault successfully contributed to profitability of the company over 1997.[9][64] His reputation of successful performance under François Michelin was repeated under the first CEO of the freshly privatized Renault.

Nissan and the Renault–Nissan Alliance[edit]

Nissan Renault CEO Carlos Ghosn visited Norway to launch the new Nissan LEAF (8 April 2013).

Ghosn with Vladimir Putin in 2006

In March 1999, Renault and Nissan formed the Renault–Nissan Alliance, and in May 1999 Renault purchased a 36.8% stake in Nissan.[65] While maintaining his roles at Renault, Ghosn joined Nissan as its chief operating officer (COO) in June 1999, became its president in June 2000, and was named chief executive officer (CEO) in June 2001.[46] When he joined the company, Nissan had a consolidated interest-bearing net automotive debt of more than $20 billion (more than 2 trillion yen),[55][66] and only three of its 46 models sold in Japan were generating a profit.[67] Reversing the company's sinking fortunes was considered nearly impossible.[68][69][70][71]

Ghosn's "Nissan Revival Plan", announced in October 1999, called for a return to profitability in fiscal year 2000, a profit margin in excess of 4.5% of sales by the end of fiscal year 2002, and a 50% reduction in the current level of debt by the end of fiscal year 2002.[72][73][74] Ghosn promised to resign if these goals were not met.[75] Ghosn's Nissan Revival Plan called for cutting 21,000 Nissan jobs (14% of total workforce), mostly in Japan; shutting five Japanese plants; reducing the number of suppliers and shareholdings; and auctioning off prized assets such as Nissan's aerospace unit.[72][76][77]

Ghosn was the fourth non-Japanese person to lead a Japanese automaker, after Mark Fields, Henry Wallace, and James Miller were appointed by Ford to run Mazda in the late 1990s.[78] In addition to cutting jobs, plants, and suppliers, Ghosn spearheaded major and dramatic structural and corporate-culture changes at Nissan. He defied Japanese business etiquette in various ways, including by eliminating seniority-based and age-based promotion, by changing lifetime employment from a guarantee to a desired goal for when the company achieved high performance, and by dismantling Nissan's *keiretsu* system – an interwoven web of parts suppliers with cross-holdings in Nissan.[79][80][81] When the Nissan Revival Plan was announced, the proposed dismantling of *keiretsu* earned Ghosn the nickname "*keiretsu* killer",[82] and *The Wall Street Journal* quoted a Dresdner Kleinwort Benson analyst in Tokyo as saying Ghosn might become a "target of public outrage" if Nissan threw former affiliates out of its supply chain.[83][84] Ghosn changed Nissan's official company language from Japanese to English, and included executives from Europe and North America in key global strategy sessions for the first time.[85][86]

In the first year of the Nissan Revival Plan, Nissan's consolidated net profit after tax climbed to $2.7 billion for fiscal year 2000,[87] from a consolidated net loss of $6.46 billion in the previous year.[88] Twelve months into his three-year turnaround plan, Nissan had returned to profitability, and within three years it was one of the industry's most profitable auto makers, with operating margins consistently above 9%—more than twice the industry average.[89] The goals of the Nissan Revival Plan were all reached before 31 March 2002.[90]

In May 2002, Ghosn announced his next set of goals for the company, "Nissan 180", a three-year plan for growth based on the numbers 1, 8, and 0: By the end of September 2005, Nissan planned to increase its global sales by one million vehicles; and by the spring of 2005, it was committed to achieving an operating margin of at least 8% and reducing its net automotive debt to zero.[91][92] These goals were all reached:[93] In the spring of 2003, Nissan announced that its net automotive debt was eliminated in fiscal year 2002.[94][95] Nissan's operating profit margin climbed to 11.1% in fiscal year 2003;[96] it had been 1.4% in fiscal year 1999.[97] In October 2005, Nissan announced that its annual sales from 30 September 2004, to 30 September 2005, were more than 3.67 million, up from the 2.6 million vehicles sold in the fiscal year ended March 2002.[98][99]

Carlos Ghosn unveiled the Nissan GT-R at the Tokyo Motor Show (2007).

In May 2005, Ghosn was named president and chief executive officer of Renault.[46] When he assumed the CEO roles at both Renault and Nissan, Ghosn became the world's first person to run two companies on the Fortune Global 500 simultaneously.[100]

In 2005, billionaire investor Kirk Kerkorian acquired a 9.9% stake in General Motors (GM) and seated one of his representatives on the company's board, then urged GM to investigate a merger with Renault and Nissan with Ghosn as the new chairman of GM. In 2006, GM's embattled management rebuffed the takeover attempt, and by the end of the year, Kerkorian's Tracinda Corp. sold most of its GM stock.[101]

In 2006, Ford Motor Co. made Ghosn a formal offer to lead the company.[102] Ghosn refused, reportedly saying the only way he would come to the struggling company was if he was named both the CEO and chairman of the board. Bill Ford Jr. refused to give up his chairmanship.[103]

Carlos Ghosn at Nissan's Honmoku Wharf, a logistics hub about 10 km southeast of Nissan's global headquarters in Yokohama, July 2011

In 2007, Ghosn led the Renault–Nissan Alliance into the mass-market zero-emission electric car market in a major way, and committed €4 billion (more than $5 billion) to the effort.[104][105][106][107] In 2008, he confirmed that Nissan–Renault would bring an "entire lineup" of zero-emission electric cars to the worldwide market by 2012.[108][109] In 2009, he told the University of Pennsylvania's Wharton School of Business, "If you're going to let developing countries have as many cars as they want—and they're going to have as many cars as they want one way or another—there is absolutely no alternative but to go for zero emissions. And the only zero-emissions vehicle available today is electric ... So we decided to go for it."[110] The Nissan Leaf, an electric car billed as "the world's first affordable zero-emission car",[111][112] debuted in December 2010.[105][113] As of 2017, the Renault–Nissan Alliance is the world's electric vehicle leader, selling more than twice as many electric cars as Tesla, and the Nissan Leaf is the world's best-selling electric vehicle by a wide margin.[114]

Ghosn was a visible leader in recovery efforts after the Japanese earthquake and tsunami on 11 March 2011, one of the worst natural disasters in modern history.[115] On 29 March 2011, he made the first of several visits to the hard-hit Iwaki engine plant in Fukushima prefecture, 50 km (31 miles) from the Fukushima Daiichi nuclear power plant,[116][117][118] and at his direction Nissan restored full operations at the Iwaki factory well ahead of expectations.[119][120][121] He appeared on television in Japan to encourage optimism.[118][122][123][124] In May 2011, Ghosn remained committed to building at least 1 million of Nissan's cars and trucks in Japan annually.[125] In 2011 Ghosn was under scrutiny by the French government for mishandling a spying scandal related to Renault.[126][127]

In June 2012, Ghosn was named deputy chairman of the board of directors of Russian automobile manufacturer AvtoVAZ.[128] In June 2013, he was appointed chairman of the Russian company, a position he retained through June 2016.[129][130][131][132][133] Renault had begun a strategic partnership with AvtoVAZ in 2008 by acquiring a 25% stake in the company;[134] this led to increasingly deeper partnerships between Renault–Nissan and AvtoVAZ,[135] ending in Renault–Nissan Alliance control of the Russian automaker in 2014.[136]

In February 2017, Ghosn announced he would step down as CEO of Nissan on 1 April 2017, while remaining chairman of the company.[21][137] Hiroto Saikawa, succeeded Ghosn at Nissan.[21] In November 2018, Renault owned 43.4% of Nissan, while Nissan owned non-voting shares equal to 15% of Renault's equity.[138][139]

Mitsubishi[edit]

Carlos Ghosn at the Annual Meeting of the World Economic Forum in Davos (2008).

In October 2016, Nissan completed the acquisition of a controlling 34% stake in Mitsubishi Motors. Ghosn became, in addition to his Renault–Nissan posts, chairman of Mitsubishi, with an aim to rehabilitate the automaker after a months-long scandal involving fuel-economy misrepresentation and consequent falling revenues. The Nissan–Mitsubishi partnership includes partnership in developing electric automobiles for Mitsubishi, and the Renault–Nissan–Mitsubishi Alliance creates the world's fourth-largest auto group, after Toyota, Volkswagen AG, and General Motors Co.[140][141][142]

Mitsubishi Motors board removed Ghosn from his role as chairman on 26 November 2018, following his arrest and ousting from Nissan for alleged financial misconduct.[26]

Advisorships[edit]

Ghosn served on the International Advisory Board of Brazilian bank Banco Itaú (a major party in the privatisation of Renault) until 2015.[143][144] He is also a member of the Advisory Board of Tsinghua University School of Economics and Management in Beijing.[145] He has received an honorary doctorate from American University of Beirut;[146] and he is a member of the Strategic Council, Saint Joseph University of Beirut.[147] In 2014 and 2015, he was elected president of the European Automobile Manufacturers Association.[148][149][150] He serves as governor of the World Economic Forum.[151]

Arrest in Tokyo and subsequent Nissan investigation[edit]

Initial arrest[edit]

On 19 November 2018, Tokyo District Prosecutors arrested Ghosn at 4:30 p.m. upon his re-entry into Japan aboard a private jet that had come from Lebanon,[152] for questioning over allegations of false accounting.[153][154][155][156] Ghosn's top aide Greg Kelly, a Nissan director and former head of human resources, was also arrested upon his arrival from the U.S. that day.[138]

On the same day, Nissan chief executive Hiroto Saikawa announced at a press conference that Ghosn had been dismissed from Nissan's board and would be stripped of executive rights at a meeting to be held on 22 November. Saikawa stressed that the dismissal was the result of an internal inquiry by Nissan,[157][154] and alleged that Ghosn and Kelly had under-reported their compensation (a violation of securities law) and used company assets for personal use.[158] While the allegations remained unproven in court, with due legal process pending, at the same news conference, Saikawa "expressed disappointment, indignation, and despair at Ghosn's conduct, which included using company funds for personal investments and misusing corporate assets" and also said, "This is an act that cannot be tolerated by the company... It is sufficient grounds for his dismissal."[158]

Although the company did not provide details, reports in the Japanese media stated that Nissan was paying all or some of the costs at some amount of US$18 million for residences used by Ghosn in Rio de Janeiro, Beirut, Paris and Amsterdam, and that Ghosn charged family vacation expenses to the company.[156] The purchases of some of these residences and the payment of expenses were handled by a shell company named Zi-A Capital BV based in the Netherlands, which Kelly had instructed Nissan's board to set up to make venture investments at the end of 2010 (around the same time as Ghosn's divorce from his first wife and beginning of a relationship with his second wife).[138] Nissan funds were used to purchase Ghosn's Paris apartment in 2005, and Zi-A funds were used to purchase his $5 million beachfront Rio apartment in 2012 and his Beirut mansion, which, with renovations, cost over $15 million.[138] Nissan compliance auditors began trying to track Zi-A activity in 2014 but were stymied at first by the chain of shell companies used in Zi-A investments.[138]

In addition, to avoid reporting the full amount of his compensation in Nissan financials, as required by Japanese law beginning in 2010, Ghosn had Kelly structure complicated deferred payment plans which went unreported under an aggressive interpretation of the disclosure rules which Nissan's outside auditors had not signed off on, and which totaled around $80 million at the time of his arrest eight years later.[138] According to *Nikkei* reports, Ghosn told investigators that he instructed Kelly to handle the compensation reporting in a legal manner, and Kelly told investigators that he acted on advice from outside law firms and the Financial Services Agency in handling the reporting.[159][160] Leaks to the media said that Ghosn had planned to call a vote to fire Nissan CEO Saikawa and reinstate Kelly (who had semi-retired to the U.S. in 2015) to active service at the scheduled board meeting.[138]

Ghosn was detained at the Tokyo Detention House, under Japanese rules that allow suspects to be detained for up to 23 days without criminal charges being filed.[161] Ghosn and Kelly were reportedly arrested on information provided by an unidentified non-Japanese executive in Nissan's legal department, in the second deal ever struck under Japan's recently introduced plea bargaining system.[156] Charges were filed against Ghosn and Kelly on the underreporting of deferred compensation on 10 December, along with allegations of additional charges that restarted a 10-day holding period without bail.[138] Nissan also took control of the Rio and Beirut properties and changed the locks, which has led Ghosn's family to sue for access.[138]

Continued detention and new charges[edit]

On 21 December 2018, Ghosn was re-arrested on suspicion of shifting to Nissan personal losses of US$16.6 million related to a personal swap contract in October 2008 (during the global financial crisis).[162] The introduction of those charges prevented Ghosn's release on bail later the same day, because the new charges permitted an additional 10–20 days of incarceration prior to a bail hearing.[162] Subsequent reporting linked this charge to Ghosn's dealings with Sheikh Khaled al-Juffali, the vice chairman of one of Saudi Arabia's largest conglomerates and majority owner of a company which owns half of a regional joint venture called Nissan Gulf, with the other half held by a wholly owned Nissan subsidiary.[163] In return for a personal letter of credit from Juffali to Ghosn during the 2008 crisis, which served as bank-demanded collateral for Ghosn's swap contract, Nissan indirectly paid $14.7 million from an internal discretionary fund known as the "CEO Reserve" to a wholly owned Juffali company in four installments between 2009 and 2012, although the internal documentation did not specify the ultimate recipient.[163] According to Tokyo prosecutors, Kelly was not involved in this transaction and so was released on bail on 25 December.[163]

Ghosn made his first public appearance after his arrest at an arraignment on Tuesday, 8 January 2019, where he asserted his innocence, making a statement in response to the main allegations against him; however, his bid to be released from prison on these charges was rejected.[164][165]

Ghosn's imprisonment was set to end on January 11 2019. That day, Ghosn was indicted on two additional charges: aggravated breach of trust and understating his income, once again extending his imprisonment.[166][167][28] As a result, he could remain in jail for months more before a trial takes place.[165] Two days later, Nissan's investigation allegedly found that, in addition to the underreporting of salary already charged, Ghosn had paid himself an undisclosed $8 million in 2018 from a Netherlands-based joint venture owned by Nissan and Mitsubishi that was set up in 2017, without the knowledge of either company's directors because Ghosn had the sole authority to dispense cash from the venture.[168]

Ghosn again appealed the denial of bail from January 8 2019 and offered to meet greater restrictions and higher guarantees of appearance in return for his release, including wearing an ankle bracelet and posting his Nissan stock as collateral.[169] Additionally, on 14 January 2019 Ghosn's wife Carole published a letter that she wrote to Human Rights Watch protesting against his treatment in detainment.[139][170] Nevertheless, on 21 January 2019, the Tokyo district court again denied bail.[171]

The Japanese term hitojichi shihō ("hostage justice") has been brought up in some media reports.[172][173][174] Takashi Takano, one of Ghosn's lawyers stated that the Japanese judicial system is a country risk.[172][175]

Further developments[edit]

Carlos Ghosn (2007).

On 11 January 2019[176] José Muñoz, Nissan's chief performance officer and head of its China operations, resigned from the company, effective immediately.[177] Muñoz, considered to be a close ally to Ghosn and a possible successor as CEO of Renault and Nissan, had been a "person of interest" in Nissan's internal investigation, with which he was reported to be uncooperative.[177] One of Nissan's three independent directors opined that Nissan may simply eliminate the position of chairman and not replace Ghosn, a route previously taken by other scandal-plagued Japanese companies.[178] The Reuters Japan news service reported that Nissan may file suit against Ghosn personally.[170][179]

At first the French government and Renault had been reported to be standing behind Ghosn during his imprisonment, on the presumption that Ghosn is innocent until proven guilty.[28] However, France's financial minister Bruno Le Maire stated on 16 January that Renault may seek a new CEO to replace

Ghosn due to his continued incarceration.[170][139] Renault possibly worried about Nissan taking the chance to use the power vacuum at Renault to reshape the alliance's balance of power.[139][180] After the French government called for leadership change and his bail requests were rejected by the Japanese courts, Ghosn finally agreed to step down.[29] He resigned as chairman and CEO of Renault on 24 January 2019.[29][31]

On January 30 2019, Ghosn said the charges were "plot and treason" by executives at Nissan who opposed the relationship with Renault and a future plan that was in the works to integrate Nissan, Mitsubishi and Renault.[181] In mid-February 2019, Ghosn's lead counsel Motonari Otsuru stepped down and was replaced by Jun'ichirō Hironaka, who has a record of success in a number of high-profile cases.[182]

Bail[edit]

In early March 2019, Ghosn was granted a request for bail in a Tokyo court. This was his third bail request, and the first by his new legal team under Hironaka. The court set bail at 1 billion yen (about US$9 million) subject to stringent conditions. He was not allowed to travel abroad, and had to remain at a given address under 24-hour camera surveillance, with no internet access. He was released on 6 March 2019.[183][184]

On April 3 2019, Ghosn tweeted that he was "ready to tell the truth" and that he would hold a conference on April 11 2019.[185] He was re-arrested for the fourth time early on April 4 2019 over new suspicions of financial misconduct concerning alleged dealings via Oman.[30] Ghosn released a statement claiming the arrest was "outrageous and arbitrary".[186] Until that point in time he had been held for 108 days since he was first arrested in November 2018.

On 8 April 2019, during an extraordinary shareholders meeting, Nissan shareholders voted to remove Carlos Ghosn from the company board.[187] Shareholders also voted to remove Ghosn's former right-hand man Greg Kelly, and to appoint Renault chairman Jean-Dominique Senard as a director.[31] The next day, Ghosn posted a YouTube video, where he publicly stated that he was "innocent of all the accusations that came around these charges that are all biased, taken out of context, twisted in a way to paint a personage of greed, and a personage of dictatorship". He also claimed that the payments to Juffali were meant to help Nissan fix a dispute with a local distributor, and to open a bank contract to convert his salary from yen to US dollars, in order to avoid currency swings.[188]

The Japanese court rejected an appeal filed by Ghosn's lawyers, and approved an initial 10 days detention for Ghosn, until April 22 2019.[189] He was released in late April, but confined to strict house arrest, including having no contact with his wife for four months.[32]

Investigations in other countries[edit]

In June 2019 Renault published that in an internal audit they had uncovered 11 million euros in questionable expenses by Ghosn,[190][33][191] which was followed by the French state opening its own investigation into his actions.[192] Prosecutors in the district of Nanterre west of Paris stated that anti-fraud police had searched his residence in the town of L'Étang-la-Ville for evidence.[34] In July Renault's headquarters in Boulogne-Billancourt were searched by 20 police personnel in relation to this case.[35] July also saw Carlos Ghosn take action against French mass-media for libel.[*citation needed*]

In August 2019 his wife Carole appealed to President Emmanuel Macron of France to intercede on behalf of her husband with Japanese leader Shinzo Abe at the 45th G7 summit held from 24–26 August[193][194] at the French town of Biarritz.[32]

In September 2019, in one of the first legal accords of the saga, Ghosn settled with the U.S. Securities and Exchange Commission over claims of failing to disclose more than $140 million in pay to him from Nissan. He was fined $1 million while Nissan was fined $15 million and Greg Kelly $100,000. Although he neither admitted nor denied the SEC's charges, he accepted a ten-year ban from serving as an officer or director of a public company. Kelly accepted a five-year ban under similar terms.[192] According to *The New York Times*, the settlement all but ended Ghosn's career as a global business executive.[195]

Flight from Japan[edit]

On 30 December 2019, numerous media outlets reported that Ghosn had escaped from Japan and arrived in Beirut, Lebanon.[36][196] Ghosn later confirmed these reports through a statement released by his press representative in New York.[197] In his statement, Ghosn claimed that he would "no longer be held hostage by a rigged Japanese justice system where guilt is presumed, discrimination is rampant and basic human rights are denied."[197]

Ghosn left his Tokyo apartment at around 14:30 on December 29 2019 and joined two men at a nearby hotel.[198] The three then took a bullet train from Shinagawa to Osaka and arrived at a hotel near Kansai International Airport just after 20:00.[198] The team hired to extract him from Tokyo had noticed that Japanese security did not follow Ghosn into hotels, which facilitated his escape.[199] A few hours later, two men left the hotel carrying large containers, including an audio equipment box where Ghosn was hidden.[200] The men then boarded a Bombardier Global Express private jet with Turkish registration TC-TSR. The large box carrying Ghosn was never x-rayed or checked by customs officials, because it was too big to fit inside the x-ray machine;[201] the plane left Kansai Airport at 23:10, landing at Istanbul Atatürk Airport at 5:26 on the morning of December 30 2019.[202][203][204] Within an hour of the plane's landing, a separate private jet left for Beirut.[202] An employee at Turkish private jet operator MNG Jet admitted to falsifying passenger records, in which two separate planes were leased, one from Dubai to Osaka and then Osaka to Istanbul, while the other from Istanbul to Beirut.[205][206] On 8 May, Turkey charged seven people accused of helping Ghosn flee to Lebanon via Istanbul.[207]

Arrest warrants issued by Japanese prosecutors on 30 January 2020 claimed that the escape operation was orchestrated by former United States Army Special Forces soldier Michael Taylor, a private-security contractor with extensive contacts in Lebanon. The warrants also claimed that Michael was assisted by his son Peter Maxwell Taylor and a third American, George Antoine Zayek.[208][209] Michael Taylor had conducted similar international rescue operations in the past and has also served time in prison in the United States.[210] On 20 May, United States authorities arrested Michael and Peter Taylor on suspicion of helping Ghosn escape.[211] On 30 October 2020, the US agreed to extradite the Taylors to Japan.[212]

Residence in Lebanon[edit]

Following Ghosn's arrival in Lebanon, a Tokyo court granted a request by Japanese prosecutors to revoke his bail.[213] While Japan and Lebanon are both members of Interpol and have had diplomatic relations since 1954,[214] there is no extradition agreement between the two countries.[36] Interpol has issued a red notice for his arrest.[215] Japanese authorities raided Ghosn's Tokyo apartment on 2 January looking for evidence.[216][217] Separately, some Lebanese lawyers want Ghosn prosecuted over his 2008 trip to Israel as the chairman of Renault-Nissan to meet Better Place founder Shai Agassi, which they claim violated the Arab League boycott of Israel.[218]

Ghosn later addressed reports that his family, including his wife Carole, may have played a role in his departure from Japan, stating that "such speculation is inaccurate and false."[219] On 7 January, prosecutors in Japan issued an arrest warrant for Carole Ghosn on suspicion of giving false testimony during a court hearing in April 2019.[220]

Carlos Ghosn held his first press conference since leaving Japan on 8 January 2020, in which he described his imprisonment conditions, pleaded innocence and named Nissan executives who plotted his demise.[221] He claimed that when he left Japan, "I fled injustice and political persecution.[195] The next day, Judge Ghassan Ouiedat, a Lebanese prosecutor, imposed a travel ban on Ghosn.[222] After his escape from Japan, Carlos Ghosn's Japanese lawyer and

seven other members of his defense resigned. His lawyer, Junichiro Hironaka, said his escape was a "complete surprise".[223]

On February 10 2020, Ghosn hired former Disney president Michael Ovitz, co-founder of the Creative Artists Agency, as his Hollywood agent.[224] On February 12 2020, Nissan launched a $90 million lawsuit against Ghosn for alleged “corrupt” actions,[225] and on February 29 2020, Japan's financial regulators fined Nissan 2.42 billion yen ($22 million) for underreporting remuneration of former Chairman Ghosn and other executives for years.[226] On July 8 2020, *The Nikkei* reported that $862,500 was paid from a Paris bank account related to Ghosn to Promote Fox, a company managed by Peter Taylor, an ex-Green Beret who helped him flee to Lebanon.[227]

Ghosn's house in Lebanon sustained damage following the August 2020 Beirut explosion, which occurred 5 kilometers away from the residence.[228]

On 3 November 2020, Lebanon's prosecutor general decided not to charge Ghosn for visiting Israel in 2008 because a statute of limitations has expired.[229]

In November 2020, the United Nations human rights group said that the Japanese government should give Ghosn a "compensation" and "other reparations" due to the arrest and detention conditions in November 2018.[230]

In December 2020 it was reported that French investigators would meet with Ghosn in January 2021 as part of a separate investigation of expenses covered by a Dutch subsidiary of Renault and Nissan.[231] Ghosn is under two investigations in France, one that is focused on suspicious transactions between Renault and a distributor in Oman, as well as another investigation into alleged illegal payments for private trips and events paid by Renault-Nissan’s Netherlands-based holding company RNBV. In a January 2021 interview Ghosn questioned why France are questioning him over the charges, while the Japanese didn't, and denied the charges.[232]

Personal life[edit]

Carlos Ghosn at 2014 Paris Motor Show.

Ghosn's first marriage was to Rita Kordahi, who came originally from Rayfoun, Lebanon, and whom he met in France in 1984. Together they had four children: Caroline, Nadine, Maya and Anthony.[233] They divorced in 2012.[138] In May 2016, Ghosn married Lebanese-American[234] Carole Nahas and, a few months later in October, threw a large-scale Marie Antoinette-themed party at the Grand Trianon of the Palace of Versailles, in the outskirts of Paris, to celebrate both the wedding and Carole's 50th birthday.[235][236] He is reported by several Japanese media to have six private residences: in Tokyo, Paris, Rio de Janeiro, Amsterdam, Beirut and New York.[237][238]

Ghosn, whom *Forbes* magazine called "the hardest-working man in the brutally competitive global car business",[56] as of 2006 was splitting his time between Paris and Tokyo and logging roughly 150,000 miles (241 400 km) in airplanes per year.[56] Japanese media called him "Seven-Eleven" ("work very hard from early in the morning till late at night").[84] He holds Brazilian, French, and Lebanese citizenships.[233] He has been noted for his direct, results-and execution-oriented style in business strategy meetings,[56] and for his interest in resolving problems from within a company by listening to workers and by cross-functional and cross-cultural team groupings.[81]

Ghosn is multilingual, speaking four languages fluently: French, Portuguese, English, and Arabic, and he has also studied Japanese.[59][239] He is a partner in Ixsir, a winery in the northern coastal town of Batroun, Lebanon.[240] In 2012 he was named to the Honorary Board of the American Foundation of Saint George Hospital in Beirut.[241][242]

Ghosn was hailed as a potential presidential candidate in Lebanon.[*when?*][243][244] In a June 2011 survey by life-insurance company Axa, Ghosn was ranked No. 7 in a random poll asking Japanese people, "Which celebrity do you want to run Japan?" (Barack Obama was No. 9, and Prime Minister Naoto Kan was No. 19.)[245][246][247] He has so far declined such overtures, saying he has "no political ambitions".[243]

Ghosn's lawyers have stated he has chronic kidney disease which they claim was worsened by his lack of access to proper treatment while imprisoned.[248]

In the media[edit]

Carlos Ghosn interviewed by LinkedIn Influencer (2014).

Beginning in November 2001, Ghosn's life story was turned into a superhero comic book series in Japan, titled *The True Story of Carlos Ghosn*, in the manga comic book *Big Comic Superior*.[249] The series was published as a book in 2002.[84][250] His face has been reproduced both in Lebanese postage stamps and in bento boxes in Japanese restaurants.[251]

Ghosn is the subject of a number of books in English, Japanese, and French. In English, he wrote a best-selling business book called *Shift: Inside Nissan's Historic Revival*.[252] He was the subject of another business book called *Turnaround: How Carlos Ghosn Rescued Nissan* by David Magee.[253] He also provided strategic business commentary and on-the-job lessons to aspiring managers in a book called *The Ghosn Factor: 24 Inspiring Lessons From Carlos Ghosn, the Most Successful Transnational CEO* by Miguel Rivas-Micoud.[254]

Awards and recognition[edit]

As a result of his achievements, Ghosn has had numerous awards and honors bestowed upon him. Some of these include:

- In 2001, he topped *TIME* magazine's list of Global Influentials, beating Bill Gates and several other globally renowned businessmen.[255]
- In 2001, he was named Father of the Year by a Japanese community group.[256]
- In 2002, he was appointed a Chevalier of the Legion of Honour (*Knight of the Legion of Honour*) by the French government.[257]
- In 2002 *Fortune* awarded him Asia Businessman of the Year.[11][12]
- In 2003, he was named Man of the Year by *Fortune* magazine's Asian edition.[14]
- In 2003 *Fortune* listed him as one of the 10 most powerful business leaders outside the U.S.[13]
- In 2004, he became the first foreign business leader to receive the prestigious Blue Ribbon Medal from Emperor Akihito of Japan.[258]
- In 2004, he was added to the Automotive Hall of Fame.[259]
- In 2004, he was also added to the Japan Automotive Hall of Fame.[260]
- In 2006, Ghosn was made an Honorary Knight Commander of the Order of the British Empire.[261]
- In 2010, *CEO Quarterly* magazine listed Ghosn as one of the "Most Respected CEOs"[262]
- In 2011, CNBC listed Ghosn as Asia Business Leader of the Year.[263]
- In 2012, Ghosn was awarded the Grand Cordon of the Order of Ouissam Alaouite, an honorific designation to civilians in recognition of services that benefit Morocco.[264]

- In 2012, Ghosn received the Japan Society Award.[265]
- In 2012, Ghosn became the first person in the auto industry, and the fourth overall, to win a Lifetime Achievement Award from the Strategic Management Society, a non-profit group that promotes ethical and strategic business stewardship.[266]
- In 2012, Ghosn was awarded the Grand Cross of the Order of Isabella the Catholic, an honorific designation to civilians in recognition of services that benefit Spain.[267]
- In 2013, he was appointed an International Fellow of the Royal Academy of Engineering.[268]
- In 2017, Lebanon's national post office, LibanPost, unveiled a collectable stamp honoring Carlos Ghosn.[269]

Pre-1800 History

"The 1,000-acre island, steeped in history and first sighted by Europeans when **Capt. John Smith** sailed up the Chesapeake in the early 1600s,...." [https://www.bizjournals.com/washington/breaking_ground/2014/09/georgetown-brokerage-tapped-to-market-an-island.html]

"Once a farm, [the Gibson Island] namesake was **John Gibson** who owned the island from 1793 to 1819." [https://www.capitalgazette.com/lifestyle/home_garden/ph-ac-cc-how-schwab-gibson-island-1201-20161203-story.html]

John Gibson was a "notable Talbot County businessman and legislator." [HB002Y][GDrive] John Gibson was "a relative by marriage of the mid-18th century Maryland governor, Samuel Ogle; and a business associate of **Charles Carroll of Carrollton**. (Wikipedia: https://en.wikipedia.org/wiki/Charles_Carroll_of_Carrollton) " [HG0039][GDrive]

"Gibson's son **William Gibson** (1788-1868) was an early American surgeon whose groundbreaking surgical techniques and experimentation paved the way for advances which would revolutionize surgery by the Civil War. He [...] has ties to St. John's College in Annapolis, Princeton, and served as the Chair of the Surgery Department at the University of Pennsylvania from 1819 until he retired in 1855." ([HX000Q][GDrive] / Full book at [HX000P][GDrive])

"The [..] farm [on Gibson Island that John Gibson owned was] at [Gibson Island's] Sandy Point". John Gibson's] business associate of Charles Carroll of Carrollton, in fact, "held a mortgage on the property during the Gibson ownership. No records have been located to indicate if Gibson maintained (c.1816) a farm at Sandy Point, although he resided elsewhere.. " [HG0039][GDrive] . It is not clear if there was any farmhouse on the island while John Gibson owned the island. "The first clear evidence of the existence of the Sandy Point Farm House appears in the records of settlement of Henry Mayer's estate (1833)." [HG0039][GDrive]

"The [next] owner of the farm at [Gibson Island's] Sandy Point [was] Henry E. Mayer (-1831). At his death, Mayer left the Farm House, a barn, Negro slave quarters, seventeen slaves, a carriage house, a stable, a wooden granary, and a personal inventory worth $4,173.90. Mayer's executor sold the farm to Baptist Mezick in 1833. Mezick and his son Thomas Mezick continued to operate farm through the 19th century. They supplemented their income with rents from property they owned in Baltimore City." ([HG0039][GDrive])

1858 - Sandy Point Lighthouse

"The original Sandy Point Lighthouse, a brick keeper's dwelling with a lantern room placed on the roof, was built onshore at Sandy Point in 1858. Like Smith Point and Thomas Point Shoals, the onshore station was replaced by offshore lighthouses to more adequately mark offshore shoals. On August 3, 1854 Congress appropriated $8,000 to build a lighthouse at Sandy Point near the present site of the Chesapeake Bay Bridge. Approximately two acres of land located about 600 feet north of the point and a right-of- way was purchased from Baptist Mezick and his wife Mary for $526. A contract was let to W.J. Humes to built a 12-story 31.5- by 18.5-foot brick keeper's quarters with an integral tower and lantern room surmounted on the roof. The tower was painted red, and the lantern was fitted with a fifth-order Fresnel lens exhibiting a fixed white flashing light. The dwelling had four rooms, an attached kitchen, and a cellar. The main entrance through one of the gable ends was decorated along the roofline with Victorian sawn work. Nearby was a brick cistern 5 feet across and 5 feet deep. " (see [2018-uscg-historian-office-sandy-point-light-stattion-nrhp.pdf][GDrive])

Source : [HG003A][GDrive]

The Gibson Island development was the idea of Baltimore judge and businessman Stuart Symington. Tradition recalls Symington's principal motivation for developing a private summer community was his displeasure over the quality of and the long delays at Baltimore area golf courses.

Apparently, others shared the same frustration and Symington soon persuaded approximately forty-five friends and colleagues to join him in creating a new club. In 1921, after a year of inquiry, Symington purchased Gibson Island for $165,000. Here Symington was inspired to create what he called " a club within reasonable distance of the city, where attractive people of moderate means could enjoy summer events such as yachting, bathing, golf and tennis." The Gibson Island enterprise, to use Symington's words, was "not a stock company, not a land development scheme, not a business venture in any sense of the word. It [was] a purely social club, in which membership [could] be had only by invitation. ""

Gibson Island was promoted as a community designed to appeal to "attractive persons of moderate means." Initial membership was selected from an elite demographic and included.wealthy businessmen, socialites and politicians from Baltimore, and to a lesser degree, Wilmington, Philadelphia, and New York. Newspapers, with some degree of hyperbole, touted the new private resort community as "The Newport of the South." While the architecture of Gibson Island lacks the ostentation of the Newport homes built by the Vanderbilts, Rockefellers, an Dukes, Gibson Island's plan and architecture clearly displays the taste and social pursuits of the well-to-do in the 2nd quarter of the th 20 century.

Resorts and recreational communities such as Gibson Island, as well religious and intellectual counterparts such as camp meetings and later chatauquas, began to appear in earnest following the Civil War. The expanded network of railroads made such destinations physically and economically realizable to a larger number of people. Furthermore, the "back to the land" movement, spawned in reaction to the perceived degenerative qualities of life in the Industrial Revolution, provided philosophical underpinnings, and promoted nature's salubrious effect of on mind, body, and spirit.

This increased popularity of public resorts and private summer communities reflects the economic and social dynamics of the state and nation in the period between the Civil War and Great Depression. Locally Baltimore, like many industrial-based urban centers, experienced rapid economic expansion. Growth crescendoed in the 20th century. Baltimore entrepreneurs created 103 new businesses during the 1920s alone, and the steel industry and import-export trade flourished. This led to the observation that "There is no place in the United States so susceptible [as Baltimore]of successful industrial development."

Increased industrialization in combination with a continued influx of job-seeking immigrants exacerbated urban problems and fueled the wealthy and middle-class's demand for suburban housing and rural retreats. It is in this overarching socioeconomic context that Gibson Island (as well as other such Anne Arundel County resort communities as Sherwood Forest, Bay Ridge and Calvert County's North Beach and Chesapeake Beach) came into being.

Symington communicated frequently with the Olmsted Brothers, impressing upon them his ideas for the island. In one correspondence he relays his vision of "summer residences amid spacious, beautiful, restful surrounds, where refreshing breezes prevail, where the usual summer past times of the country are to be had, and at a distance from Baltimore, but not so great as to make it prohibitive for a business man to go back and forth daily when his affairs require daily attendance, and yet great enough to ensure that going out there will be going into the country and not merely moving to another part of the suburbs."

The social tenor of the club community, and its emphasis on family is captured in an undated brochure, titled Gibson Island Port of Homes. Following is an extended excerpt: "Two men were talking the other day about their families. "How well do you know your children one asked?" "I don 't know them at all " was the reply " ... it's a fanny age. Home life, as far as I can see it will soon be as extinct as Henry Ford's plan to get the bovs out of the trenches by Christmas. "

"Sway out! Had this man known about Gibson Island, had he observed even casually what is being done there to create the ideals of American home life that meet 20th century conditions, I believe he would have thought twice about making such a statement. Gibson Island is in no sense a "community" development. It does not tolerate for an instant any of the characteristics (such as the haphazard jumbling together of various groups, like as not antagonistic in type, custom and tradition) which makes that sort of thing unendurable, if not actually odious to discriminating people ... The list of people who may build on Gibson Island or become members is carefully supervised, though not with any gesture of snobbishness, nor with the establishment of false social values in mind. There is nothing to suggest in the slightest the more spectacular phase of modem life, for you would have to travel far indeed to discover such a complete lack of show. Unconventionality of the offensive sort and the laxity of conduct that passes sometimes even in exclusive circles these days is frowned upon. Yet there is a total absence of formality of anything like a feeling of constraint."

Lot purchase was controlled by the Symington family and was linked to membership in the club from which Jews and African Americans were excluded. This restriction did not extend to club employees, and while in law school Thoroughood Marshall, later the first African-American to be appointed a justice of the U.S. Supreme Court, worked as a busboy at the Gibson Island Club House. During the late 1920s, club membership and residence on the island was practically confined to those listed in the Baltimore Social Register. A 1925 Sunday American Newspaper article substantiates and suports this in the following observation. "Folk who have never been fortunate enough to have their names grace the Social Register or the Blue Book have been trying without success to purchase property on the Island. The Island's governors wisely have discouraged all such applications."

Initially Stuart Symington and his New York financier brother, Thomas, personally carried the financial burden of the project. To meet the expected $800,000 financial obligation the club's target membership was placed at 1000 and divided into three classes (a) house owners (b) seasonal tenants of club cottages or club rooms (c) short-

term non-residents. By 1922 club membership was at 600 and "all of the very best social class and current receipts were inadequate to meet the already accumulated $627 ,628 financial commitment. The Symington brothers responded by forming the Gibson Island Land Company and moved forward with development using bank loans. This marked the beginning of what became the Symington's continuing financial woes.

The Olmsted plan called for 423 residential lots and two eighteen-hole golf courses, but financial constraint affected the plans execution. The idea of a second golf course was abandoned, and against the Olmsted's strenuous objections, additional trees were cut to increase the number of premium water-view lots. While the financial concern, the Gibson Island Land Company, continued to struggle, the social aspect, the Gibson Island Club, was the success its creators envisioned.

The Gibson Island Land Company undertook construction of the community club house, soon followed by the building of "summer cottages" by individual members. A large number of the Gibson Island Club's original members maintained a permanent residence in ·the Olmsted-designed, Baltimore neighborhood of Roland Park and a number of architects associated with Roland Park houses accepted commissions on Gibson Island, including Parker, Thomas & Rice; Edward Palmer, jr.; and Palmer, Willis & Lamdin. Gibson Island architecture, as well as membership, has always been regulated. Promotional material from the 1920s states that plans for every house and other improvement must be approved by the Company's architectural committee, which is composed of leading architects.

In his letters Stuart Symington promotes the Gibson Island Club and community as a place of relaxation for persons of moderate means, however many of the founding members had considerable wealth. Prosperity is relative and to those familiar with the ostentation of resort communities such as Newport, Rhode Island;

Jekell Island, Georgia; or Palm Beach, Florida, the life-style of Gibson Islanders was restrained. A more suiting comparison is the Yeamans Hall Club community located outside Charleston South Carolina.

The Olmsted Brothers designed Yeamans Hall Club two years after completing work at Gibson Island. In contrast to Gibson Island, Yeamans was winter golfing and sporting resort. However, like Gibson Island, the plan was laid out to preserve natural areas of bauty and featured a club house surrounded by private "cottages". Furthermore, Yeamans Hall Club displays the same size and type of architecture as that found at Gibson Island. Exploring further parallels between Gibson Island, Yeamans Hall Club, and other Olmsted Brothers' communities is a very worthy avenue of research.

The "cottage style" architecture of Gibson Island is representative of early 20th century taste. French Eclectic , Spanish Eclectic and Tudor Revival architecture were especially common in suburban communities during the period between the two World Wars. The popularity of these historically imprecise styles has been characterized by some a backlash against the then dominant Colonial Revival style, and also the result of a renewed interest in European-inspired architecture popularized by servicemen returning from abroad following World War I. With the approach of World War II these styles went out of favor as American taste began to reject foreign influences.

During the 1920s and 1930s, however buildings evocative of rural England, France, Italy, etc., were very much in vogue. A Gibson Island promotional package from the 1920s depicts a number of Gibson Island's oldest and finest homes that are representative of this genre. This promotional material is copied and included in the attachments.

Sally Symington Henderson, the granddaughter of Thomas Symington, recalls that the [XX]play of money was frowned upon and never discussed. The modem trend toward "mansionizing" and elaborate landscaping is definitely a trend among the new generation. Perhaps it is more accurate to describe Gibson Island as a private community aimed at the moderately wealthy. It seems founding members either did not view themselves as rich or, given the fact that membership included members of the DuPont family, refused to present it.

Despite conscious restraint, Gibson Island summer life was not without a certain [X}arefied air. When Mrs. Henderson was asked where residents took most of their meals, she replied that the popular conception that families usually ate at the club was incorrect. Most meals, she reports were taken at home-prepared by the family cook. Mrs. Henderson also recalls that many houses were originally equipped with servant quarters, most of which, in this post-servant society, have been removed.

Early advertisements and oral tradition emphasize the importance of family and organized activities and instruction for children were widely available. Golf, tennis and sailing were available for members, and instruction in these activities provided for their children. Golf may be the initial motivation behind the creation of the Gibson Island Club, but it is sailing for which it is renown. Throughout its history, the Gibson Island Yacht Squadron has been the sponsor of nationally-recognized regattas, most notably the Gibson Island to New London race, and many prominent sailors started their career at Gibson Island. 1 Members of the Gibson Island Garden Club for ladies also achieved national distinction.

As expected, the stock market crash of 1929 and the subsequent Great Depression adversely impacted members and significantly curtailed new construction. The Gibson Island project was also set back due to circumstances involving the Gibson Island project's principle backers, specifically the death of Stuart Symington and the bankruptcy of Thomas Symington. Sally Symington Henderson said economic hardship forced a number of families to relinquish their summer homes, and others including Thomas Symington, gave up their city homes and took up year-round residence on the island. Hardship, like wealth proved relative, and despite financial retrenchment, sailing, golf tournaments continued. Gibson Island society life persevered through World War II, however charity drives, fund-raisers and bandage wrapping parties were as much a part of the summer social calendar as swimming and sailing.

In the post-war era Gibson Island began an earnest transformation away from a summer resort to a year-round community. Long-time resident, Jimmy Wolfe, revealed in an interview that Gibson Island culture began a subtle shift at this time. The number of out of state members decreased and somewhat diminished the club's cosmopolitan reputation. In addition, during the early years members usually had business or personal associations with each other outside of Gibson Island, a situation that became less typical in the post-World War II era. The increased proportion of year-round residents precipitated renovations and expansions of what were once "summer cottages" as well as new construction. The increased number of year-round residents prompted the establishment of the Gibson Island Country School. This elementary school, located on the mainland near the gate house, first opened in 1956 and maintains a very solid reputation.

In the approximately seventy-five years since the Gibson Island Corporation and Gibson Island Club were inaugurated, significant changes have taken place in response to changing lifestyles. However, Stuart Symington's vision of a private, professional class community where members are able to enjoy a full variety of recreational activities, within close proximity of the city, remains fully intact.

Gibson Islanders don't light cigars with $10 bills

By Kathy Lally

"They think we're all a bunch of millionaires," the curmudgeonly voice harrumphed over the telephone, "sitting out here lighting our cigars with $10 bills."

"They give you the devil if you talk about it," a high little voice quavered, "and I don't want to get the devil."

Gibson Island. About 175 families living on 2½ square miles of wooded and rolling wild land, surrounded by the Magothy River and the Chesapeake Bay, connected to the rest of Anne Arundel county by a causeway that juts off from the end of Mountain road.

Residents call it paradise, a garden where foot has not fallen in a few green-growing areas for 50 years. Peter A. Jay, a columnist for *The Sun*, once called it the kind of place that does not welcome Jews, recent arrivals from those Mediterranean countries where garlic is popular, or people with tattoos.

Most of the people who live there don't like to talk about Gibson Island. They have, they say, been burned before. People, they say, think they're snobs, very rich snobs.

Those who do talk about it sputter, "Balderdash."

Bryden Bordley Hyde, a Baltimore architect, a man with a strong sense of history and tradition, moved to Gibson Island in 1949 after buying his 2 acres at the edge of Otter Pond for $2,750. In 1960, he bought another acre for $4,000.

He is sitting now, a white-haired man in well-worn gray suit, impatient to get to work this morning, but pausing to talk about his home, looking out at the rain slanting into the lake, looking at the thick clutch of trees that ring the lake, hiding the sight of any other house.

"It's foggy one minute, and cloudy the next. Then the sun is shining," he says. "It's a constantly changing show. It's a real treat to be here."

It was love of the water and the unspoiled land that brought him to the island, Mr. Hyde says. "I married this Bermuda gal, and this was as close to Bermuda as we could get."

The island was developed in 1921. "It was the Symington brothers. One was Senator Stuart Symington's father. They and their friends put up the money. They had difficulty getting on the Baltimore Country Club golf course on Saturdays, so they started this, mostly for the golf course," he says.

And the life-style has remained one that revolves around the land, the outdoors, around boating and swimming, golf and tennis, and walks in the woods, a park-like setting that Mr. Hyde says was designed by the Olmsted brothers who laid out Central Park in New York.

"Some of the most distinguished people in Baltimore city were living here in the old days. They were socially top drawer," he says. "I would say the character of the place is not socially oriented now."

There are a variety of retired service people, colonels and generals and admirals. "We've also had our fair share of presidents and vice presidents of corporations," Mr. Hyde says.

John Krantz, the University of Maryland professor who invented Bufferin, lives there. So does Anthony L. Conrad, who was chairman and chief executive of RCA until he got into income tax troubles. Pulitzer prize-winner Bob Woodward of the Washington *Post* has a house there. And there still are lots of people who are listed in the Blue Book.

Yet, Sarah Henderson, known as Sally, who spent her summers there as a girl and returned to live, who is a descendant of the founders, says there are many people like her and her husband.

Mrs. Henderson is headmistress of Gibson Island Country School. Her husband is an author who mostly writes about sailing.

"A lot of people think Gibson Island is loaded with millionaires," Mrs.

Prospect of Crown refinery in city alarms countians in Marley Neck

By Karen Hosler

North county residents who led a stormy campaign three years ago which succeeded in blocking construction of an oil refinery on their side of the Marley Neck peninsula are all fired up again.

Initially aroused this month by signs that Crown Central Petroleum Corporation is moving ahead with plans to build its refinery on the Baltimore side of the peninsula, the anti-refinery lobby now is worried that county officials may allow accompanying tank farms or petro-chemical plants to slip over the border.

The first alarm was sounded early this month when it was learned that city officials had requested $50,000 in federal money for a study of the impact a refinery on Hawkins Point, at the tip of the peninsula, would have on the city's economy, transportation and air and water pollution problems.

A second alarm went off in those north county communities two weeks ago when county officials acknowledged that they had requested an additional $20,000 so the study could be expanded to include a survey of the effects a Hawkins Point refinery would have on Anne Arundel county and the Chesapeake Bay.

The citizens became fully mobilized, however, when they became aware of a draft of the Regional Planning Council's general development plan for the Baltimore region, which urges that serious consideration be given to a refinery at Hawkins Point/Marley Neck and suggests that a nearby petro-chemical complex also would be an economic boon to the area.

They plan to protest en masse at a public hearing on the draft plan scheduled for 7 P.M. Tuesday at the Arundel Center and also hope to convince federal officials to deny money for the study.

Nan Milligan, treasurer of the United Council of Civic Associations and a longtime warrior against the oil refinery plans, explained that her concerns revolve on two points.

- County officials seem to have quietly joined a study she fears will promote the city's pro-refinery position and;
- A draft plan, which all but endorses the refinery, was prepared with the assistance of county representatives.

"The wording of the plan is very upsetting," she added, noting that the scheme makes no distinction between the Hawkins Point site and use of the entire peninsula.

"Crown has plans to put the refinery on a 500-acre tract at Hawkins Point," she said, "but it had intended to use a 1,340-acre site in Anne Arundel county. We don't think the refinery can be contained on a 500-acre site. We think it may be slipped across the border and we are particularly worried about the satellite industries."

Carol Vitek, of the Silver Sands Civic Association, pointed out that although the plan mentions the need for examining possible dangers of industries that could further deteriorate the area's air quality and the ill effects oil spills would have on commerical fishing and recreational uses of the bay, it urges that these concerns not be weighed too heavily.

Specifically, the plan says, "The policy to avoid any negative environmental impact 'at all costs' must be tempered by the economic needs of the state and region."

"The boundary is only an imaginary line," Mrs. Vitek said. "What Baltimore city wants to do for its economy is going to hurt us. I don't care how many new jobs it creates or how much its adds to the tax base; it's not worth killing a river and the whole bay."

Although the county enacted a ban on any oil refineries within its boundaries in 1974 and its zoning ordinance prohibits tank farms and most chemical, paint and plastic manufacturing industries, the citizens fear that county officials may move to ease those restrictions.

Hogwash, says the county executive, Robert A. Pascal.

"We are opposed to an oil refinery on either side of the county line and we will do everything in our power to stop it," he said. "We believe the Chesapeake Bay area is entirely too sensitive and too important to take a chance on oil spills or any other pollutants. Why gamble with the liabilities?

"Baltimore city is going to make all of the money from this thing and we and the rest of the counties in the bay area are going to suffer from it," he said.

"Obviously, we are unhappy about

ISLAND, from Page 1

Henderson, a warm, cheerful woman says. "It simply is not true. There are a lot of people working very hard, a lot of people like me and my husband, where both are working." They include, she says, Lydia Barr, the first-grade teacher, and her husband, and other teachers on the staff.

When Stuart Symington, Jr., a Baltimore city judge who was the father of the Missouri senator and was Mrs. Henderson's great-uncle, decided to develop the island, he got financial backing from his brother, Mrs. Henderson's grandfather, Thomas Harrison Symington.

Her grandfather, Mrs. Henderson says, was an inventor, a self-made man who made a lot of money through railroad inventions, particularly one

"They are people who love having the space around them," Mrs. Henderson says. "You can walk in the woods and not worry about it. Your children can ride their bikes anywhere, and you don't have to worry about it. Practically everyone is involved or has been involved in some kind of sports—either golf or tennis or they walk or they're beachcombers. A lot of people are gardeners.

"People are very conservation conscious. Many a time I've seen people stop their car and get out to pick up a beer can. The community garden clubs take care of the triangles. They don't hire anyone to do that.

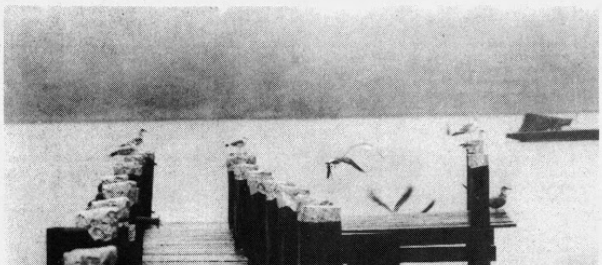
"Life is very simple. Entertaining is done mostly in the home. Food is simple and good. People don't get dressed up very much. A blouse and

tired from selling real estate. She plays nine holes of golf everyday. And when she returned home from a trip to Ireland, she ignored the jet lag and the very day of her return summoned her grandchildren and cooked them all a big meal.

"She's retired from the real estate business, but she's not retired from life," Mrs. Henderson says. "She also goes birding, which is something a lot of the people are interested in. We have a bird count twice a year."

Mrs. Symington displays a zest for life and a love for her surroundings that is typical of the island and that has spilled over into the school, Mrs. Henderson says.

Gibson Island Country School is a one-story building, rambling from growth by addition, that sits on the



that kept train wheels from catching fire.

"My great-uncle was a family man," she says. "He had a big family, and he was concerned that the family didn't spend enough time together in the summer. The children would be off to camp, and so forth. So he got the idea of developing the island so they could all vacation here and the fathers could commute to work."

The island was three farms then, and it had been farmed for hundreds of years. It is believed the Piscataway Indians cultivated it first, and land grant records date from 1665. People still find arrowheads and grinding stones.

The original orientation of the summer people was to Baltimore, but as the years passed and unspoiled waterfront became rarer, many began to come from Washington. Now, says Leroy Wilbur, Jr., president of the Gibson Island Corporation, there are no summer-only houses, and most but not all people live there year-round.

"Now that it's year-round, it's a lot better," Mrs. Henderson says. "The loyalties are to this community."

Mrs. Henderson remembers living on the island year-round during the Depression. "My family lived in the garage of the house my grandfather built—as the family's fortunes diminished, that's where we went."

Most of the people are drawn to Gibson Island because of the water and not any desire for exclusiveness, she says, and Mr. Wilbur agrees.

long skirt—that's about it.

"There's lots of false images of Gibson Island. A lot of people think it's very snooty. It's not. People are wonderful to their neighbors. . . . I think it's a great place to live."

After her marriage, Mrs. Henderson lived in Baltimore 2½ years. "I knew I was not a city girl," she says. "We were fortunate to come when it was possible, when a young family could still buy a house. My husband and I built our house after the war. Now, I don't know how a young couple gets a roof over their heads anywhere in this county today."

Her house, Mrs. Henderson says, was built for $12,500.

"I think there are a lot of people on Gibson Island who have sorted out their values," Mrs. Henderson says, "and have decided what's important are the things money can't buy—a safe community, a caring community. I don't think you could walk or drive around Gibson Island and say that person has a lot of money or that person doesn't. It isn't that kind of place.

"I think most of the people on Gibson Island have a sense of knowing what they're doing with their lives."

It's a family place, she says, where all the kids on the island call Mrs. Henderson's mother, Sarah Symington, BeeBee. "That's what her grandchildren call her," Mrs. Henderson says.

She describes her mother as something of an island matriarch. She was 76 Thursday, and only last year remainland, near the foot of the causeway and overlooking the harbor. It began as a one-room school in the top floor of the post office on the island.

"I had taught in the public school system. After my husband and I built a house down here, I was going to do the traditional thing . . . stay home with my two children," Mrs. Henderson says.

"That was in 1951, and we had the little school in the post office. The teacher left, and they asked me to finish the year, and I've been finishing it ever since."

The school had been there about 10 years before she arrived, Mrs. Henderson says. As it grew, and swelled into several rooms in the post office, a group of businessmen on Gibson Island decided the school should be expanded.

It was decided to put it on the mainland, and open it to non-island residents. And it has developed in such a way, says Mrs. Henderson, its first and only headmistress, that it reflects the values of life on the island.

"We wanted a school that dealt with the basics humanely," she says. "One of the basic ideas behind the school was that it remain small. All the teachers know all the pupils."

There are 131 pupils in grades kindergarten through six with 10 full-time teachers and 4 part-time. The school began with one small building financed by the founders in 1956. In 1958 a gym was added, another wing was built in 1969 and the kindergarten came in 1974.

The original money was raised by the founders, and the school has never been in debt, Mrs. Henderson says, which has helped keep tuition relatively low for a private school—$750 for kindergarten and $1,015 a year for the other grades. "Because of that, this school is open to a much broader economic base than it might otherwise be," she says.

"One of the things the founders wanted to do was give the opportunity to a larger area than just Gibson Island," she says. Now there are 17 island children, and the others come from the Severna Park, Glen Burnie, Linthicum area.

"I think in this kind of school we know exactly what we're doing, from the board of trustees to the teachers, to the parents to the children," she says. "When you get into a big school, you lose that.

"Hi, Caroline," she smiles to a little blonde girl who is going by in a navy blue sweater with the school emblem on it.

"I know every pupil, and I know their parents. We can keep tabs on every child's progress. With a small group of children you can really individualize. There has not been the machine or technique invented that can take the place of the human response."

She goes into the first-grade classroom, where Mrs. Barr has her 11 children at the board. Mrs. Barr has them write a word. One child doesn't connect his letters properly, and Mrs. Barr shows him how to do it.

"In a larger school, the child would do that on paper, get the paper back tomorrow, and never really understand what was wrong," Mrs. Henderson says. "Here he finds out immediately. And we see immediately he is having a problem. In a larger school, you might not know until Christmas."

The philosophy, she says, is that "an elementary school child needs to be touched by a teacher everyday—physically, academically, spiritually and morally."

The school has an art history class for the sixth grade, pupils learn French, there are rows of guitars in the main hallway for music lessons. The Old Testament and ancient history are taught. A couple of times during the year there is a poet in residence to talk about writing poetry for a week.

A rabbi comes to discuss Jewish holidays. "We have children of all faiths. We respect each holiday. We don't this year, but when we have minority children, we make sure the children appreciate what is different," Mrs. Henderson says.

When the school was founded, she says, all members of the board were Gibson Islanders. Not all are now.

"It's entirely separate from the [Gibson Island] Corporation," she says, "but it's a symbiotic relationship. The gate does watch over our school."

The gate.

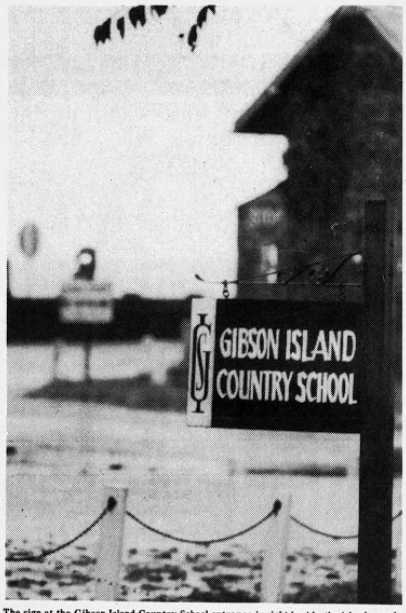
One longtime resident, who would not be interviewed, whispered over the phone, "The gate. We have that gate and all, it makes people mad. We have to be careful what we say."

As you round a bend in Mountain road, you see two red lights, a speed bump and the gate at the approach to the causeway. There's always a guard

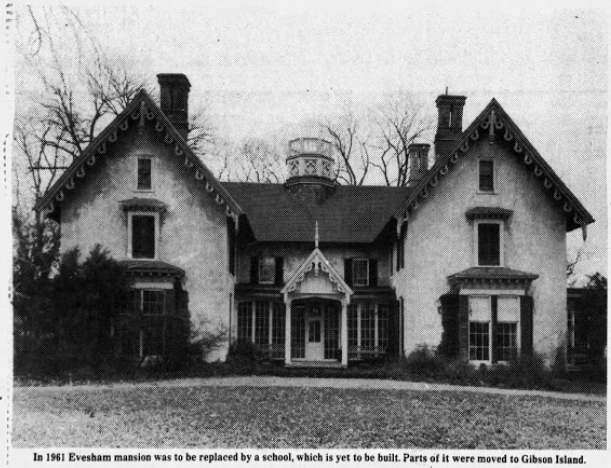
See ISLAND, Page 3, Col. 1

Sunpapers photos—Walter M. McCardell

Sea gulls perched on a pier lift off into the morning haze along Gibson Island's shoreline.



The sign at the Gibson Island Country School entrance is right beside the island guard house (background). Islanders say they don't worry about the children's whereabouts.



In 1961 Evesham mansion was to be replaced by a school, which is yet to be built. Parts of it were moved to Gibson Island.

Hydes took mansion with them, in pieces

When his boyhood home had to come down, when the Victorian mansion built about 1800 faced the wrecker's ball, Bryden Bordley Hyde, a Baltimore architect, decided to bring as much of it as he could with him to Gibson Island.

The 23-room mansion was Evesham, which had been remodeled into a neo-Gothic villa in 1850. It once stood off Evesham avenue, on 80 acres about a mile from York road.

"It was done by Joseph Patterson who was Betsy Patterson's brother," Mr. Hyde explains. "Betsy Patterson had married Napoleon's brother, Jerome."

Joseph Patterson's daughter, Caroline, married Reverdy Johnson, Jr., a famous jurist and ambassador to the Court of St. James's after the Civil War. They lived in the house, which was a great country estate.

"My grandfather bought it in 1895," Mr. Hyde says. "I was born there. My mother moved there when she was 6, and we lived in it until everyone had died off but my mother, and she was in 23 rooms by herself."

The land was sold in 1961 for a city school, which has yet to be built. "I had an arrangement to take any parts I wanted," Mr. Hyde says. He had bought an acre lot next to his house on Gibson Island, and decided to use as much of Evesham as he could for a home for his mother, Mrs. G. Ray Hyde, on that site.

Using the parts, Mr. Hyde built the new house and his mother lived in it from 1961 until January, 1974. She is in a nursing home now, and the house is rented, awaiting eventual occupancy by Mr. Hyde's daughter and son-in-law, Dr. and Mrs. James L. Gamble 3d.

"Assuming they keep it 18 years, the parts will have been in the family 100 years," Mr. Hyde says.

The new house has only seven rooms, filled with antiques from the old mansion, and it looks like a tiny wing of the big old house. There are big marble fireplaces and carved moldings. The chimney from Evesham was saved, and the original stairway was taken along as well as mirrors, chandeliers, linen-fold doors and two dormer windows.

"I was very fond of that old house," Mr. Hyde says.

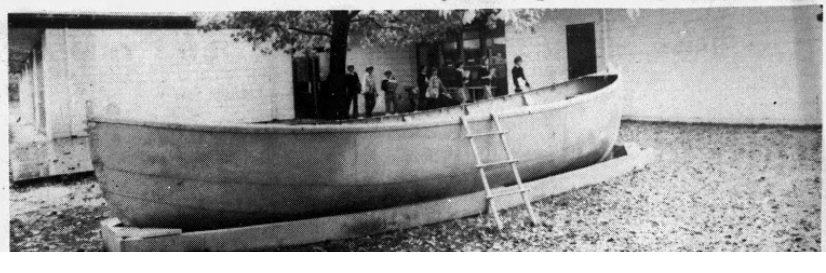
There's a bus that goes from down-

to be barred by covenant. People in the Baltimore Jewish community say Jews were kept out, unless someone who already owned a house happened to marry a Jew.

But Mr. Wilbur says that has changed. The last five families who bought, he says, moved in without anyone knowing anything about them. Restrictions are a thing of the past, he says.



There's a bus that goes from downtown Baltimore to Gibson Island, used by pupils of the school and by the women who work as domestics on the island and at other houses out that way. If you call to ask for schedule information, the Mass Transit Authority will tell you you better have a pass if you want to get on the island. "A guard gets on the bus and checks," they tell you.

"It's the gate," Mr. Hyde says. "People get mad at the gate. They get mad whenever they think they can't go somewhere. But why should they? Do you know what would happen? There would be picnickers everywhere. We work hard. We pay our taxes, and they're plenty high. So why shouldn't we be left alone?"

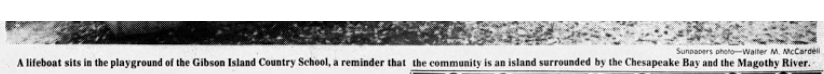
The gate, its critics say, is the symbol of Gibson Island's exclusiveness. Mr. Wilbur concedes that before the Supreme Court outlawed such things, there were restrictive covenants on the island.

The sale of property to blacks used

And Mr. Krantz says, as a woman's voice on an extension commands, "You're not supposed to give anything out by phone. You know that," that such covenants are illegal. "It's not restrictive," he says. "There's nothing criminal here. You restrict yourself." And as for life on the island, he says, "It's the Garden of Eden."

It does look like paradise, once you get on the island. There's a long winding drive, past the sailboat-topped memorial to the founding Symington. The roads curve about, first past the white frame post office, the Gibson Island Corporation, in which residents are eligible for shares. The shareholders vote for the board, which runs the island.

Then there's the Gibson Island Club, an expensive country club with pool, an organization that runs most of the boating activities. You don't have to be a member to live there, but most people are. Near the club is what some derisively call Cellblock 9, a white block-shaped building with



Sunpapers photo—Walter M. McCardell

A lifeboat sits in the playground of the Gibson Island Country School, a reminder that the community is an island surrounded by the Chesapeake Bay and the Magothy River.

black doors where residents can put up guests.

The roads wind about, Ha'penny Way and Broadwater, Ayrlie Water and Skippers Row. They take you past little concrete block houses that have been expanded and spruced up, past modest Cape Cods and suburban ranchers, past the occasional big, breathtaking place.

Mostly there is the land. And it is beautiful. Even on an ugly day, it is beautiful. The little roads twist through rolling hills. It's quiet. And the lake wells up behind the trees, the trees that curl and twist and spring and grow everywhere. The rain only makes it glisten in a soft fantasizing mist.

Gibson Island deserves a break, Mr. Hyde says. "It always gets twisted around to make you look like a bunch of bloody snobs," he says. "It isn't any social register kind of thing. We have ordinary people. It isn't really a snob act. It's just a nice way to live."

The Gibson Island Corporation, which runs the island, has made life in that section of Anne Arundel county "a hell of a lot more pleasant," he says.

That's hard to dispute. Wandering off Mountain road on your way to Gibson Island, you come across a lot of waterfront where tacky little houses perch in untidy groups, where shabby bars draw a rough-neck crowd, where the trees and green grass have been worn into scrubby weeds and yards trailed with junk.

"The coastline of Maryland has been jeopardized by being this close to Washington," Mr. Hyde says. "There's Edgewood Arsenal and Aberdeen Proving Ground. And Patuxent Naval Air Station. And the nuclear power plant at Calvert Cliffs. There are all kinds of things creeping in that are making life miserable."

"God is making more people but not anymore land," he says. "So we try to protect our little thing and keep a low profile."

And so most residents keep their counsel when asked about Gibson Island. They keep a low profile. And the rumors persist. And one is left to wonder—Bob Woodward has a house there—would Carl Bernstein, the other half of the *Post* Watergate team, be let in?

Read "The Disappearing Islands of the Chesapeake"

The following is pages 33 to 37 is captured here : [HB002X][GDrive]

[HB002T][GDrive]

At the mouth of the Magothy River, Gibson Island's nine hundred acres encompass a well-sheltered harbor, Otter and Cooley Ponds, and a very private community. Accessible by a single road and causeway that are closed to the public, the island community is guarded by a stone gatehouse that is manned twenty-four hours a day. The island's 180 or so property owners make up the Gibson Island Corporation, which manages the island. At the heart of this wealthy community is the exclusive Gibson Island Club. Members not only may partake of clubhouse activities but also may enjoy a golf course—eighteen holes if you play one nine in reverse—a pool, marina, and skeet-shooting range. However, members of the venerable Gibson Island Yacht Squadron and students at the Gibson Island Country School are not required to be island residents.

Gibson Island has had a long history of occupation. Artifacts and a large shell midden on the bay side of the island tell of Indian inhabitants who gathered oysters and other foods from the Chesapeake. These Indians were probably of Algonquian stock, pushed south by fierce Susquehannocks.

First patented in 1667, the island had four owners and contained approximately 1,200 acres. By 1771 William Worthington owned what was then known simply as "the great island," and in 1792 he advertised it for sale: "The land is remarkably valuable for the Fertility of its soil, and Conveniency of its situation to Baltimore, Annapolis, and other Markets . . . It abounds with Plenty of Timber and Wood. And has the advantage of productive Fisheries, and Variety of wild Fowl. It is adapted to every Species of Country-Produce. There are several different Tenements on it, with some useful Improvements, and it produces the greatest Plenty of Grass for Stock." In 1793 John Gibson, an Annapolis attorney, bought the island, which was part of the more than 2,000 acres of land he owned between the Magothy and Bodkin Creek.

Subsequent owners divided the island into farms, but the hilly, sometimes rugged landscape did not lend itself well to agriculture. Although during the Civil War its well-hidden harbor sheltered pro-Southern blockade runners, Gibson Island failed to attract later development. It was popular with deer and duck hunters, however. Finally, in 1921 Judge W. Stewart Symington Jr. headed a group of wealthy Baltimoreans who bought the island for $165,000. They brought in the nation's foremost landscape firm, the Olmsted brothers, who devised a plan for an elaborate summer colony with cottages organized around an eighteen-hole golf course. It was "Baltimore's newest playground," declared a 1923 article in the *Baltimore American*. Mostly woods and open space, the island was still a favorite with hunters, but Symington envisioned much more. He organized the Gibson

Opposite: In May 1938, the Baltimore *News-American* devoted a photo essay to Gibson Island, offering a glimpse of the enjoyable life it offered. The photographer captured golfers walking a plank pathway, sailboats anchored in the background. (*News-American* Collection, Marylandia and Rare Books Department, University of Maryland Libraries)

A patent dated 1667 conveyed 1,200 acres of what became Gibson Island, and a chart of 1844 portrayed it as almost entirely devoted to farming. (Courtesy of National Archives (NACP) RG 23, T175)

Island Club and had plans for the Yacht Squadron before his death in 1926. Today, a tall Celtic cross near the island's entrance honors his memory.

Following the Great Depression, real estate development made more economic sense than a golf-centered community, and the eighteen-hole course was reduced to nine holes. Gibson Island was too remote for year-round living, and development in the 1930s consisted of summer cottages. By the 1940s, however, families were taking up permanent residence on the island. The community experienced another spurt of development after World War II, and the increase in the number of young children on the island led to the creation of the Gibson Island Country School. Located outside the island gate, the school was accessible and open to children of nonislanders, who now make up most of the enrollees.

Since the 1920s the Gibson Island Yacht Squadron has flourished and earned wide acclaim. In 1929 J. Graham and C. Lowndes Johnson won the Star-Class Internationals, making the Gibson

Island Yacht Squadron the host for the championship races the following year. During World War II, a number of Gibson Island yachts served with the volunteer "Corsair Fleet" on Atlantic Coast antisubmarine patrol. Gibson Island resident Corrin Strong's cutter *Narada* was sunk off Cape Henry while on this duty.

Gibson Island's yacht squadron continued to host regattas and long-distance races for decades and offered a number of stellar sailing events. One involved the popular Star boats. An Olympic racing class of identical boats a little under twenty-three feet long, the Star boats attracted generations of good sailors, among them squadron member James Allsopp, who won the Star-Class World Cup in 1976. In 1990 the squadron hosted the J-22 World Championship Regatta, in which local sailor and author John Sherwood won first place. The squadron has continued to be active in racing and has grown to more than two hundred yachts. Some fifty Gibson Island children crew a junior fleet of Optimists, Lasers, and 420s.

A third generation of luxury homes appeared on the island during the area-wide real estate boom of the 1980s, and properties began to change hands, a thing that seldom happened previously. Nevertheless, residents attempted to uphold their unwritten policy of exclusivity. Although property ownership brings with it shares in the Gibson Island Corporation, club membership is not automatic, which is especially hard on island children barred from the pool, sailing, and other facilities. In 1991 the issue erupted in a legal battle when several property owners who were denied Gibson Island Club membership took the corporation to court. The final settlement granted all landowners use of the club's facilities but not club membership. While admitting no wrongdoing, the corporation did pay the plaintiffs' $40,000 lawyer's fee.

Disruption of the status quo came from a different quarter in the mid-1980s. Hunting on the island had ended before World War II, and some time later, it became a bird sanctuary. Along with the birds, deer also flourished, eventually overrunning the lush Gibson Island neighborhoods. In 1984, the islanders requested that the state's forestry officials organize a deer hunt. Immediately picketers appeared at the gate to protest. They succeeded in postponing but could not stop the hunt, which is now an annual event, not only on Gibson Island but at Sandy Point State Park and similar sanctuaries.

The Gibson Island Historical Society maintains a small but nice museum that is open by appointment by writing to P.O. Box 667, Gibson Island, MD 21056.

Gilead Sciences

Wikipedia Gilead Sciences

Saved wiki - [HK001L][GDrive]

Gilead Sciences, Inc. /ˈ ɡɪliəd/, is an American biotechnology company that researches, develops and commercializes drugs. The company focuses primarily on antiviral drugs used in the treatment of HIV, hepatitis B, hepatitis C, and influenza, including Harvoni and Sovaldi.

Headquartered and founded in Foster City, California, Gilead is a member of the NASDAQ Biotechnology Index and the S&P 500.

History[edit]

Foundation[edit]

External video

Gregg Alton of Gilead Sciences & others, "The Evolution of HIV/AIDS Therapies: A Conversation", 2012, Chemical Heritage Foundation via Vimeo

Gilead Sciences was originally founded under the name **Oligogen**[4] in June 1987 by Michael L. Riordan, a medical doctor who was 29 years old at the time.[5] Riordan graduated from Washington University in St. Louis, the Johns Hopkins School of Medicine and the Harvard Business School.[6] Three core scientific advisers worked with Riordan to create the company and establish its scientific vision. These were Peter Dervan of Caltech, Doug Melton of Harvard, and Harold M. Weintraubof the Fred Hutchinson Cancer Research Center. Riordan served as CEO from inception until 1996.[7][8] Riordan had previously worked for a year for venture capital firm Menlo Ventures, which proceeded to make the first investment in Gilead, of $2 million, and Menlo partner DuBose Montgomery served as Chairman of the Board until 1993, when Riordan became Chairman.[5] Riordan also recruited as scientific advisers Harold Varmus, a Nobel laureate who later became Director of the National Institutes of Health, and Jack Szostak, recipient of the Nobel Prize for Physiology or Medicine in 2009.[9][10]

The company's primary therapeutic focus was, and continues to be, in antiviral medicines, a field that interested Riordan because he contracted dengue fever, an untreatable viral disease, while working in malnutrition clinics as a Henry Luce Scholar in the Philippines.[11] Riordan recruited Donald Rumsfeld to join the board of directors in 1988,[12] followed by Benno C. Schmidt, Sr.,[*citation needed*] Gordon Moore,[12] and George P. Shultz.[12]Riordan tried to recruit Warren Buffett as an investor and board member, but was unsuccessful.[*citation needed*]

Under the technical leadership of scientist Dr. Mark Matteucci,[*citation needed*]the company focused its early discovery research on making small strands of DNA (oligomers, or more particularly, oligonucleotides) to target specific genetic code sequences (i.e., gene therapy).[4] Because of the expected healing potential of such research, Oligogen soon changed its name to Gilead Sciences, after the reputed healing properties of the ancient Balm of Gilead, and moved its headquarters to Foster City's Vintage Park neighborhood, where it has been based ever since.[4] The company's development of small molecule antiviral therapeutics began in 1991 when CEO Riordan and R&D head John C. Martin in-licensed a group of nucleotide compounds discovered in two European academic labs; one of the compounds was tenofovir, a prodrug which under the trade name Viread became one of the most widely used antiretroviral drugs.[*citation needed*]

1990-1999: IPO[edit]

In 1990, Gilead entered into a collaborative research agreement with Glaxo for the research and development of genetic code blockers, also known as antisense. This collaboration was terminated in 1998, and Gilead's antisense intellectual property portfolio was sold to Ionis Pharmaceuticals. Gilead debuted on the NASDAQ in January 1992. Its initial public offering raised $86.25 million in proceeds.

In June 1996, Gilead launched Vistide (cidofovir injection) for the treatment of cytomegalovirus (CMV) retinitis in patients with AIDS. The company cooperated with Pharmacia & Upjohn to market the product outside the United States.

In January 1997, Donald Rumsfeld, a board member since 1988, was appointed Chairman,[13] but left the Board in January 2001 when appointed United States Secretary of Defense at the start of George W. Bush's first term as President.

In March 1999, Gilead acquired NeXstar Pharmaceuticals of Boulder, Colorado following two years of negotiations with the company. At the time, NeXstar's annual sales of $130 million was three times Gilead's sales. NeXstar's two revenue-generating drugs were AmBisome, an injectable fungal treatment, and DaunoXome, an oncology drug taken by HIV patients. Also in 1999, Roche announced first approval of Tamiflu (oseltamivir) for the treatment of influenza. Tamiflu was originally discovered by Gilead and licensed to Roche for late-phase development and marketing.

One reason for entering into the Tamiflu licensing agreement was that with only 350 employees, Gilead still did not yet have the capability to sell its drugs directly to overseas buyers.[14] To avoid having to license future drugs in order to access international markets, Gilead simply acquired the 480-employee NeXstar, which had already built its own sales force in Europe to market AmBisome there.[14]

2000 to 2009[edit]

2000 to 2009[edit]

Viread (tenofovir) achieved first approval in 2001 for the treatment of HIV.

In 2002 Gilead changed its corporate strategy to focus exclusively on antivirals, and sold its cancer assets to OSI Pharmaceuticals for $200 million.[15]

In December 2002, Gilead and Triangle Pharmaceuticals announced that Gilead would acquire Triangle for around $464 million; Triangle's lead drug was emtricitabine that was near FDA approval, and it had two other antivirals in its pipeline.[15][16] The company also announced its first full year of profitability. Later that year Hepsera (adefovir) was approved for the treatment of chronic hepatitis B, and Emtriva (emtricitabine) for the treatment of HIV.

During this era, Gilead completed its gradual evolution from a biotech startup into a pharmaceutical company.[4][12]The *San Francisco Chronicle* noted that by 2003, the Gilead corporate campus in Foster City had expanded to "seven low-slung sand-colored buildings around a tiny lake on which ducks happily paddle."[4] Like many startups, Gilead originally leased its space, but in 2004, the company paid $123 million to buy all its headquarters buildings from its landlords.[12] However, even as Gilead developed its ability to distribute and sell its own drugs, it remained distinct from most pharmaceutical companies in terms of its strong reliance on subcontracting most of its manufacturing to contract manufacturing organizations.[17]

In 2004, Gilead launched Truvada. Years later, though efforts of activists and other groups, Gilead was convinced that a fixed-dose combination of tenofovir and emtricitabine could be used as a pre-exposure prophylactic against the transmission of HIV. [18]

In 2006, Gilead completed two acquisitions that allowed the company to branch out from its historical antiviral franchise into the cardiovascular and respiratory therapeutic arenas. Under an agreement with GlaxoSmithKline, Myogen marketed Flolan (epoprostenol sodium) in the United States for the treatment of primary pulmonary hypertension. Additionally, Myogen was developing (in Phase 3 studies) darusentan,[19] also an endothelin receptor antagonist, for the potential treatment of resistant hypertension.

In 2006, the company acquired Corus Pharma, Inc. for $365 million. The acquisition of Corus signaled Gilead's entry into the respiratory arena. Corus was developing aztreonam lysine for the treatment of patients with cystic fibrosiswho are infected with *Pseudomonas aeruginosa*.

In July 2006, the U.S. Food and Drug Administration (FDA) approved Atripla, a once a day single tablet regimen for HIV, combining Sustiva (efavirenz), a Bristol-Myers Squibb product, and Truvada (emtricitabine and tenofovir disoproxil), a Gilead product.[20][21]

Gilead purchased Raylo Chemicals, Inc. in November 2006 for a price of $133.3 million.[22] Raylo Chemical, based in Edmonton, Alberta, was a wholly owned subsidiary of Degussa AG, a German company. Raylo Chemical was a custom manufacturer of active pharmaceutical ingredients and advanced intermediates for the pharmaceutical and biopharmaceutical industries. Later in the same year Gilead acquired Myogen, Inc. for $2.5 billion (then its largest acquisition). With two drugs in development (ambrisentan and darusentan), and one marketed product (Flolan) for pulmonary diseases, the acquisition of Myogen has solidified Gilead's position in this therapeutic arena.

Gilead expanded its move into respiratory therapeutics in 2007 by entering into a licensing agreement with Parion for an epithelial sodium channel inhibitor for the treatment of pulmonary diseases, including cystic fibrosis, chronic obstructive pulmonary disease and bronchiectasis.[23]

In 2009, the company acquired CV Therapeutics, Inc. for $1.4 billion, bringing Ranexa and Lexiscan into Gilead. Ranexa is a cardiovascular drug used to treat chest pain related to coronary artery disease, with both of these products and pipeline building out Gilead's cardiovascular franchise.[24] Later, in the same year the company received the award for one of the Fastest Growing Companies by *Fortune*. In the same year they were also named as one America's Top Companies to work for by *Forbes*.

2010 to 2019[edit]

In 2010, the company acquired CGI Pharmaceuticals for $120 million, expanding Gilead's research expertise into kinase biology and chemistry. Later that year, the company acquired Arresto Biosciences, Inc. for $225 million, obtaining developmental-stage research for treating fibrotic diseases and cancer.[25]

In February 2011, the company acquired Calistoga Pharmaceuticals for $375 million ($225 million plus milestone payments). The acquisition boosted Gilead's oncology and inflammation areas.[26] Later that year, Gilead made its most important acquisition — and most expensive to date — with the $10.4 billion purchase of Pharmasset, Inc. This transaction helped cement Gilead as the leader in treatment of the hepatitis C virus by giving it control of sofosbuvir(see below).

In October 2011, Gilead broke ground on a massive multi-year expansion of its 17-building headquarters campus in Foster City.[27] By replacing eight one or two-story buildings with seven new structures ranging as tall as 10 stories, Gilead nearly doubled its headquarters real estate footprint from about 620,000 square feet to about 1.2 million square feet.[27]

On July 16, 2012, the FDA approved Gilead's Truvada for prevention of HIV infection (it was already approved for treating HIV). The pill was a preventive measure (PrEP) for people at high risk of getting HIV through sexual activity.[28]

In 2013, the company acquired YM Biosciences, Inc. for $510 million. The acquisition brings drug candidate CYT387, an orally-administered, once-daily, selective inhibitor of the Janus kinase (JAK) family, specifically JAK1 and JAK2, into Gilead's oncology pipeline. The JAK enzymes have been implicated in myeloproliferative diseases, inflammatory disorders, and certain cancers.

In 2015, the company made a trio of acquisitions:

- It bought Phenex Pharmaceuticals for $470 million. Its Farnesoid X Receptor (FXR) program used small-molecule FXR agonists in the treatment of liver diseases such as nonalcoholic steatohepatitis.[29]
- It bought EpiTherapeutics for $65 million. This acquisition gave Gilead first-in-class small molecule inhibitors of histone demethylases involved in regulating gene transcription in cancer.[30]
- It paid $425 million for a 15% equity stake in Galapagos NV, with additional payments for Gilead to license the experimental anti-inflammatory drug filgotinib, which may treat rheumatoid arthritis, ulcerative colitis, and Crohn's disease.[31]

In 2016, the company acquired Nimbus Apollo, Inc. for $400 million, giving Gilead control of the compound NDI-010976 (an ACC inhibitor) and other preclinical ACC inhibitors for the treatment of non-alcoholic steatohepatitis and for the potential treatment of hepatocellular carcinoma.[32][33] Also in 2016, the company was named the most generous company on the 2016 Fortune list of The Most Generous Companies of the Fortune 500. Charitable donations to HIV/AIDS and liver disease organizations totaled over 440 million in 2015.[34]

In August 2017, the company announced it would acquire Kite Pharma for $11.9 billion,[35] equating to $180 cash per share, a 29% premium over the closing

In August 2017, the company announced it would acquire Kite Pharma for $11.9 billion, — equating to $180 cash per share, a 29% premium over the closing price of the shares. The deal will add the promising CAR-T candidate to the companys existing portfolio.[36] In November, the company announced it will acquire Cell Design Labs for up to $567 million, after it indirectly acquired a stake of 12.2% via the Kite Pharma deal.[37]

On May 9, 2019, the U.S. Department of Health and Human Services announced that Gilead Sciences will donate Truvada, the only drug approved to prevent infection with H.I.V., for free to 200,000 patients annually for 11 years. [38] On December 3, 2019, HHS explained how the government would distribute the donated drugs. The new program called Ready, Set, PrEP is accepting applications from any patient who doesn't have health insurance, has a valid prescription for PrEP and has had a recent negative H.I.V. test. To apply, patients can call 855-477-8410, online at www.getyourprep.com or in person at participating health care provider. HHS Secretary Alex Azar explained that the U.S. government will pay Gilead $200 per bottle for 30 pills for costs associated with getting the drug from factories into the eventual hands of patients.[39]

In March 2020, the company announced it would acquire Forty Seven Inc. for $95.50 a share ($4.9 billion in total).[40][41][42]

Sovaldi and Harvoni[edit]

The drug sofosbuvir had been part of the 2011 acquisition of Pharmasset. In 2013, the FDA approved this drug, under the trade name Sovaldi, as a treatment for the hepatitis C virus. *Forbes* magazine ranked Gilead its number 4 drug company, citing a market capitalization of US$113 billion and stock appreciation of 100%, and describing their 2011 purchase of Pharmasset for $11 billion as "one of the best pharma acquisitions ever".[43] Deutsche Bankestimated Sovaldi sales in the year's final quarter would be $53 million,[44] and *Barron's* noted the FDA approval and subsequent strong sales of the "potentially revolutionary" drug as a positive indicator for the stock.[45]

On July 11, 2014, the United States Senate Committee on Finance investigated Sovaldi's high price ($1,000 per pill; $84,000 for the full 12-week regimen). Senators questioned the extent to which the market was operating "efficiently and rationally", and committee chairman Ron Wyden (D-Oregon) and ranking minority member Chuck Grassley (R-Iowa) wrote to CEO John C. Martin asking Gilead to justify the price for this drug.[46] The committee hearings did not result in new law, but in 2014 and 2015, due to negotiated and mandated discounts, Sovaldi was sold well below the list price.[47] For poorer countries, Gilead licensed multiple companies to produce generic versions of Sovaldi; in India, a pill's price was as low as $4.29.[48]

Gilead later combined Sovaldi with other antivirals in single-pill combinations. First, Sovaldi was combined with ledipasvir and marketed as Harvoni. This treatment for hepatitis C cures the patient in 94% to 99% of cases (HCV genotype 1).[49] By 2017, Gilead was reporting drastic drops in Sovaldi revenue from year to year, not only because of pricing pressure but because the number of suitable patients decreased.[50] Later single-pill combinations were Epclusa (with velpatasvir) and Vosevi (with velpatasvir and voxilaprevir).

Finances[edit]

For the fiscal year 2017, Gilead Sciences Insurance reported earnings of US$4.628 billion, with an annual revenue of US$26.107 billion, a decline of 14.1% over the previous fiscal cycle. Gilead Sciences's shares traded at over $70 per share, and its market capitalization was valued at US$93.4 billion in October 2018.

Prospects for the future[edit]

As of 2017, Gilead's challenge is to develop or acquire new blockbuster drugs before its current revenue-producers wane or their patent protection expires. Gilead benefited from the expansion of Medicaid in the ACA; Leerink analyst Geoffrey Porges wrote that Gilead's HIV drugs could face funding pressure under reform proposals.[53] Gilead has $32 billion in cash, but $27.4 billion is outside the U.S. and is unavailable for acquisitions unless Gilead pays U.S. tax on it, though it could borrow against it.[54] Gilead would benefit from proposals to let companies repatriate offshore capital with minimal further taxation.[55]

Gilead's Entospletinib has shown a 90% complete response rate for MLL type AML.[56]

Tax structures[edit]

On December 26, 2018, *The Times* reported that Gilead had used the Double Irish arrangement to avoid U.S. corporate taxes on non–U.S. profits, reporting that "A US pharmaceutical firm used a controversial tax loophole arrangement to shift almost €20 billion in profits through an Irish entity in just two years".[57]

Acquisition history[edit]

show

Illustration of the company's mergers, acquisitions and historical predecessors

Criticism[edit]

Several class-action lawsuits have been filed against Gilead over allegations that the company deliberately delayed development of antiretroviral drugs based on tenofovir alafenamide fumarate (TAF) in order to maximize profits from previous-generation medications containing tenofovir disoproxil fumarate (TDF).[58] Plaintiffs allege that Gilead suspended TAF in 2004 despite clear evidence indicating that TAF-based medications were safer than TDF, a compound whose long-term use was associated with adverse side effects such as nephrotoxicity and bone densityloss.[59][60] Gilead intentionally withheld results of clinical trials demonstrating TAF's relative safety and efficacy and shelved TAF-based therapies until 2010, when the Food and Drug Administration approved Gilead's application to patent TAF.[61] Gilead's first TAF medication, marketed under the trade name Genvoya, came out in 2015. In the interim period, many HIV patients who continuously took Gilead's older TDF-based drugs suffered permanent, debilitating kidney and bone damage, often developing conditions such as Fanconi syndrome and osteomalacia.[62]

Gilead has come under intense criticism for its high pricing of its patented drug sofosbuvir. In the US, for instance, it was launched at $1,000 per pill or $84,000 for the standard 84-day course.[*citation needed*]

Gilead has also tried to eliminate competition in lucrative markets by entering voluntary licensing agreements (VLA) with companies from developing countries such as India, which mandated the limitation of the latter's operations to less lucrative markets. The company has also been criticized for creating harsh restrictions within countries where they have been denied rights, or are engaged in VLAs. For example, in India, they tried to create an 'anti-diversion' program to determine who could buy the drug, which was considered a coercive and policing move by Médecins Sans Frontières since it could lead to the exclusion of vulnerable groups like refugees and migrants from accessing the medicines.[63]

In March 2020, Gilead fought to maintain its patent on remdesivir as a treatment for several coronavirus, initiating legal conflicts with the Wuhan Institute of Virology.[64] Gilead later secured orphan drug status for remdesivir, allowing the company to exclusively obtain marketing revenues for up to 7 years.[65]

[HL005F][GDrive]

Gillespie, Robert G. 81 May 18, 1933 Oct. 11, 2014 Robert "Bob" Gillespie, 81, died Oct. 11, 2014, after a struggle with Lewy body disease. His last days in hospice care were peaceful and he was surrounded by loved ones during his final hours. Bob was born May 18, 1933, in Tacoma. He graduated from Grant High School in Portland, and then attended Reed College. Bob graduated with a B.A. in Mathematics and formed a lifelong connection with Reed, serving on the board of trustees from 1996 to 2000. Following graduation in 1955, Bob entered the new field of digital computing. He first worked at **Convair Astronautics**, where he developed simulations for rocket guidance. **Next, he was responsible for software research and architecture at Boeing,** and then worked at Control Data doing advanced software development. Bob spent the following 15 or so years at the University of Washington, first as director of the computer center, then as vice provost for computing and as a member of the computer science department. In 1984, he co-founded the consulting firm of Gillespie, Folkner and Associates, which assisted in information technology planning for institutions of higher education, Federal and State agencies and the computing industry. In 1992, he founded Robert Gillespie Associates, which provided counsel on national issues of networks for universities and other partners. He was also an adviser on national computing and network policy issues for the Higher Education and Library Coalition on Information Policy, a coalition of national higher education and library associations. Bob was a visionary, long anticipating the growth of technology and the internet; because of his early advocacy, he had a profound influence on federal policies that shaped technology in higher education. He played a seminal role in the founding of computing organizations such as Northwest Academic Computing Consortium (NWACC), EDUCOM (now EDUCAUSE) and the Seminars on Academic Computing. As one of the earliest figures to rightfully be considered a university chief information officer, Bob was a model for subsequent generations of higher education IT leaders. In 1996, he was the recipient of the Kaul Foundation Award of Excellence for achievements as an educator, author and expert in the field of computing the 2009 EDUCAUSE Leadership Award in recognition of contributions to the computing profession and in 2011, the Lifetime Achievement Award from the NWACC for his role in creating that organization. Bob also had a rich and rewarding family life. He married Mary Jo Mickelson in 1953, and they enjoyed 61 years of marriage. Together, they raised two sons, Peter and Scott. Time every summer was devoted to camping, hiking, vacationing in the San Juan Islands and traveling the Pacific Northwest and beyond to visit wineries and friends. They also loved to hunt for edible mushrooms, particularly morels in the spring and chanterelles in the fall. Wine and food were two of Bob's main passions. In addition to wine tasting, he made wine for many years and never stopped researching and collecting favorite wines. He was an outstanding cook. He cooked for the family beginning in the '70s, inspiring his sons to also become happy denizens of the kitchen. Two of his other passions were fishing, particularly for ling cod and salmon in the San Juan Islands, and mountain climbing, both in the Cascades and in the Olympics. Bob is survived by his wife, Mary Jo; sons, Peter Barr-Gill- espie and Scott Gillespie; daughters-in-law, Ann Barr-Gill- espie and Nancy Gillespie; and grandchildren, Katie and Aidan Gillespie. For those who wish, donations may be made in his name to Reed College.

Reed Collge Memorial - Robert Gordon Gillespie ’55

Robert Gordon Gillespie ’55, October 11, 2014, in Portland, after a struggle with Lewy body disease. A pioneer in the field of IT in higher education, and one of the first people to be considered a chief information officer in a university setting, Bob graduated from Grant High School in Portland and earned a BA from Reed in mathematics. “The process, the challenge, the demands prepared me to be creative, confident, and a risk taker.” He maintained a lifelong connection to the college and served as an alumni trustee in 1996–2000. After Reed, Bob entered the new field of digital computing. **He first worked at Convair Astronautics, where he developed simulations for rocket guidance.** Next, he was responsible for software research and architecture at Boeing, and then worked at Control Data doing software development. But it was at the University of Washington, where he served as director of the computer center and vice provost for computing, that he found his true calling.

Bob was a visionary, long anticipating the growth of technology and the internet; because of his early advocacy, he had a profound influence on federal policies that shaped technology in higher education. **He assisted in the founding of computing organizations such as the Northwest Academic Computing Consortium, EDUCOM (now EDUCAUSE), and the Seminars on Academic Computing, and was a model for subsequent generations of higher education IT leaders.** His work was recognized with the Kaul Foundation Award of Excellence for achievements as an educator, author, and expert in the field of computing in 1996; the 2009 EDUCAUSE Leadership Award in recognition of contributions to the computing profession; and the Lifetime Achievement Award from the NWACC in 2011 for his role in creating that organization.

In 1984, he cofounded the consulting firm of Gillespie, Folkner and Associates, which assisted in information technology planning for institutions of higher education, federal and state agencies, and the computing industry. In 1992, he founded Robert Gillespie Associates, which provided counsel on national issues of networks for universities and other partners. He was also an adviser on national computing and network policy issues for the Higher Education and Library Coalition on Information Policy, a coalition of national higher education and library associations.

Bob also had a rich and rewarding family life. He and **Mary Jo Mickelson ’55** married in 1953 and raised two sons, **Peter Barr-Gillespie ’81** and **Scott Gillespie ’84.** The family enjoyed summertime camping, hiking, vacationing in the San Juan Islands, and traveling the Pacific Northwest and beyond to visit wineries and friends. They also enjoyed hunting for edible mushrooms, particularly morels in the spring and chanterelles in the fall. Wine and food were two of Bob’s main passions. In addition to wine tasting, he made wine for many years and never stopped researching and collecting favorite wines. He was an outstanding cook and inspired his sons to also become happy denizens of the kitchen. Two of his other passions were fishing, particularly for ling cod and salmon in the San Juan Islands, and mountain climbing, both in the Cascades and in the Olympics.

“Owing to the fact that Bob outlived so many of his peers, there are relatively few people in the profession today who know Bob or his work,” writes **Marty Ringle**, Reed’s chief information officer. “Being modest by nature, he spent no time engraving his name on the initiatives he championed; hence, his legacy may be obscure to all but those closest to him. But to those of us who knew him he is, and always will be, the mentor who showed us not only how to be IT leaders, but also why. Rest well, Bob, you’ve earned it.” Survivors include Mary Jo; Peter, and Scott; daughters-in-law **Ann Barr-Gillespie ’82** and Nancy Gillespie; grandchildren Katie and Aidan Gillespie; and his brother Bruce. The family suggests donations in his name to Reed College.

PURCHASING PACKAGED SOFTWARE— A CUSTOMER'S POINT OF VIEW

Duane Burke, Research Engineer and
Robert Gillespie, Chief, Research and Development
Computing Department
The Boeing Company
P.O. Box 3707
Seattle, Wash. 98124

"It is reasonable to expect that the additional tasks that the customer must perform to get a software package successfully implemented after the vendor considers it to be 'installed' will cost many times more, in terms of manhours and computer time, than what it cost to get the package in the door."

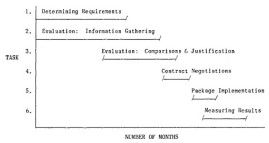
Companies can save both time and money through the use of purchased or leased "packaged programs." And from a customer's point of view, the opportunities for such savings are growing rapidly, as established software companies bring packaged programs of good quality onto the market. These savings occur since a software house is able to distribute the development cost for a package over many customers, and so the package *can* be sold or leased for less than a potential customer would pay for a similar in-house development. In addition, benefits which would accrue from having the package are lost during the time that the package is being developed in-house.

In this article the term "packaged programs" refers to such programs as generalized file handlers, decision table processors, flowcharting software, and computer evaluation software, which are being marketed separate from computers and, in most cases, by companies which specialize in software development and/or marketing.

As with any new area of business, no common body of knowledge yet exists to aid a potential customer in the acquisition of packaged programs. It is, therefore, the object of this article to pass on some useful points and experience formulated from the point of view of one customer of packaged programs. Figure 1 illustrates the phases of acquisition that will be discussed and their relative timing.

Note: The Boeing Company assumes no responsibility in connection with the use of this paper and shall not be liable for any loss or damages arising from such use. There shall be no warranty, express or implied, by The Boeing Company, as to accuracy, function, or otherwise in connection with this paper.

Figure 1. Phases of Acquisition



Determining Requirements

The requirement for a particular software package may not appear to exist until the package is available on the market. This phenomenon is not a myopic condition suffered by computer people, but is simply a matter of economics and priorities. Companies whose primary business is other than computing products or services will often find it difficult to seriously consider internal development of the kinds of generalized software which are currently being marketed. Hence, the requirement often does not get much attention if any.

[HP0044][GDrive]

Once the potential need for an existing package is identified, however, then other requirements associated with its use, if acquired, should be examined. Will the package become an integral part of an application system? or a key tool, which once adopted is almost indispensable in the development and maintenance of application systems? Packages for processing decision tables, for handling files, or for providing shorthand coding capabilities will commonly be in this category. Such packages may be termed "critical" to the functioning of the systems on which they are used.

On the other hand, a software package for producing flowcharts, although desirable from a customer's point of view, may not be critical to the functioning of any application systems, since it is used essentially for documentation and program debugging.

Some other important factors to be considered are:

(1) Hardware
(2) Operating System
(3) Other software which must co-exist and interface with the packaged program
(4) Probable use.

Evaluation: Information Gathering

The information needed for the evaluation will come from three main sources:

(1) The software vendor
(2) Other users of the software being evaluated
(3) Tests of the software especially formulated for evaluating it.

The Software Vendor

The vendor for a package is, of course, the source of most of the information needed in the evaluation. He will usually be able to give a written explanation of the following items for the package being marketed, especially if he is threatened with loss of a sale:

a. Its capabilities and features.
b. Its intended uses.
c. How to use it.
d. Its known limitations. (Usually the vendor treats this very lightly.)
e. The names of other users.
f. The date it could be installed.
g. The steps and time necessary to get it installed.
h. The results of previous tests.
i. The initial and follow-on costs.
j. The maintenance support available.

This information must be supplied in written form to facilitate its review, and to help insure mutual understanding between the customer and vendor on these details, and to express the commitment on the part of the vendor.

The "users manual" which a customer would be expected to rely on, if the package were acquired, must also be obtained. Besides giving the details necessary to prepare tests of the package, the manual may also provide a rough measure of the quality of the software.

The known limitations and errors in a package will commonly be omitted. Detailed (and emotional) discussions with the vendor will bring some of these to light. Other users, however, will provide the best source of information on limitations, errors, and other problems associated with using a package.

The availability date may be a key limiting factor in the choice of packages which can be considered for use.

Typically, the maintenance support provided by the vendor will consist of sending corrections or corrected versions, as necessary, and responding to questions regarding the package.

With regard to maintenance of a software package, this might be a good place to suggest that customers keep their software packages as near the vendor's 'off-the-shelf' version as possible in order to take advantage of the maintenance that the vendor provides and also to improve the chances of getting prompt assistance when problems with the package arise.

Other Users

The experience of other users of a package is a valuable source of information on the limitations, errors, and problems associated with a software package. Although the probability of a customer admitting he made a mistake in acquiring a package is rather remote, most customers will frankly discuss problems they may be having in the use of one. Beside the obvious advantage of helping to insure a correct choice of software, information thus obtained may help insure that the new customer's software package is more trouble-free than earlier editions.

Tests of the Software

There is no substitute for preparing and running your own tests of a software package. And the most satisfactory test site is your own. However, due to the vendor's costs and other considerations, the likelihood of getting much on-site testing during the evaluation phase is not high. This is always a serious limitation since often usage problems, program errors, and shortcomings in documentation, will come to light as a result of running only a few practical cases.

The degree and thoroughness of testing required by the customer depends on how much the package has been used by other customers and on the vendor's responsiveness in correcting errors in his package. The first half-dozen customers for a package should expect to do much more testing, than say, the twentieth customer.

It is relatively easy to identify the features and situations for which tests are desired. Somewhat more difficult and expensive is the job of preparing test data. In some cases the vendor will have a test deck which can be used to test the basic capabilities of a package. In any event tests should be prepared by customer personnel having a variety of backgrounds in order to call forth various points of view on the ease of use, usefulness, and applications for the package.

Evaluation: Comparisons Package vs. Requirements

The process of comparing software packages is an iterative one, with each iteration taking in some different facet of the software or its use. In comparing packages to requirements, the basic questions to be answered are:

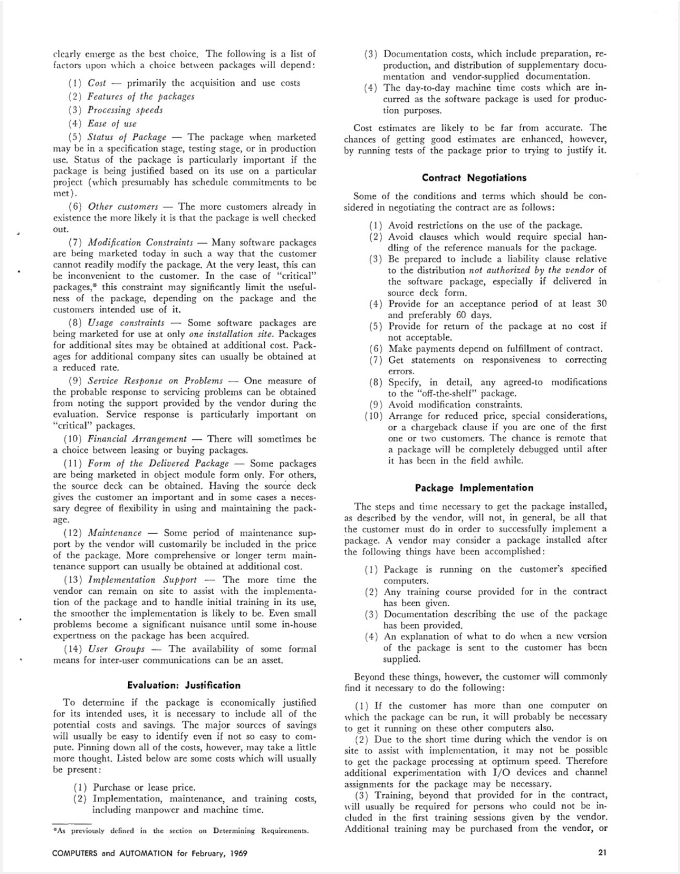
(1) Will it satisfactorily accomplish the jobs for which it is being considered?
(2) Will it be available when needed?
(3) Is it cheap enough to justify acquiring it for the jobs for which it is being considered?

One of the best ways to determine if the package will be satisfactory is to arrange that the expected users prepare the tests. Thus realistic tests can be prepared which test the "use procedures" as well as the software package.

Package vs. Package

Comparing packages with each other may be fairly easy if sufficient information has been gathered and sufficient comparisons made with the requirements. When comparing packages on the basis of a list of factors, often one package will

[HP0045][GDrive]



clearly emerge as the best choice. The following is a list of factors upon which a choice between packages will depend:

(1) *Cost* — primarily the acquisition and use costs
(2) *Features of the packages*
(3) *Processing speeds*
(4) *Ease of use*
(5) *Status of Package* — The package when marketed may be in a specification stage, testing stage, or in production use. Status of the package is particularly important if the package is being justified based on its use on a particular project (which presumably has schedule commitments to be met).
(6) *Other customers* — The more customers already in existence the more likely it is that the package is well checked out.
(7) *Modification Constraints* — Many software packages are being marketed today in such a way that the customer cannot readily modify the package. At the very least, this can be inconvenient to the customer. In the case of "critical" packages,* this constraint may significantly limit the usefulness of the package, depending on the package and the customers intended use of it.
(8) *Usage constraints* — Some software packages are being marketed for use at only *one installation site*. Packages for additional sites may be obtained at additional cost. Packages for additional company sites can usually be obtained at a reduced rate.
(9) *Service Response on Problems* — One measure of the probable response to servicing problems can be obtained from noting the support provided by the vendor during the evaluation. Service response is particularly important on "critical" packages.
(10) *Financial Arrangement* — There will sometimes be a choice between leasing or buying packages.
(11) *Form of the Delivered Package* — Some packages are being marketed in object module form only. For others, the source deck can be obtained. Having the source deck gives the customer an important and in some cases a necessary degree of flexibility in using and maintaining the package.
(12) *Maintenance* — Some period of maintenance support by the vendor will customarily be included in the price of the package. More comprehensive or longer term maintenance support can usually be obtained at additional cost.
(13) *Implementation Support* — The more time the vendor can remain on site to assist with the implementation of the package and to handle initial training in its use, the smoother the implementation is likely to be. Even small problems become a significant nuisance until some in-house expertness on the package has been acquired.
(14) *User Groups* — The availability of some formal means for inter-user communications can be an asset.

*As previously defined in the section on Determining Requirements.

Evaluation: Justification

To determine if the package is economically justified for its intended uses, it is necessary to include all of the potential costs and savings. The major sources of savings will usually be easy to identify even if not so easy to compute. Pinning down all of the costs, however, may take a little more thought. Listed below are some costs which will usually be present:

(1) Purchase or lease price.
(2) Implementation, maintenance, and training costs, including manpower and machine time.
(3) Documentation costs, which include preparation, reproduction, and distribution of supplementary documentation and vendor-supplied documentation.
(4) The day-to-day machine time costs which are incurred as the software package is used for production purposes.

Cost estimates are likely to be far from accurate. The chances of getting good estimates are enhanced, however, by running tests of the package prior to trying to justify it.

Contract Negotiations

Some of the conditions and terms which should be considered in negotiating the contract are as follows:

(1) Avoid restrictions on the use of the package.
(2) Avoid clauses which would require special handling of the reference manuals for the package.
(3) Be prepared to include a liability clause relative to the distribution *not authorized by the vendor* of the software package, especially if delivered in source deck form.
(4) Provide for an acceptance period of at least 30 and preferably 60 days.
(5) Provide for return of the package at no cost if not acceptable.
(6) Make payments depend on fulfillment of contract.
(7) Get statements on responsiveness to correcting errors.
(8) Specify, in detail, any agreed-to modifications to the "off-the-shelf" package.
(9) Avoid modification constraints.
(10) Arrange for reduced price, special considerations, or a chargeback clause if you are one of the first one or two customers. The chance is remote that a package will be completely debugged until after it has been in the field awhile.

Package Implementation

The steps and time necessary to get the package installed, as described by the vendor, will not, in general, be all that the customer must do in order to successfully implement a package. A vendor may consider a package installed after the following things have been accomplished:

(1) Package is running on the customer's specified computers.
(2) Any training course provided for in the contract has been given.
(3) Documentation describing the use of the package has been provided.
(4) An explanation of what to do when a new version of the package is sent to the customer has been supplied.

Beyond these things, however, the customer will commonly find it necessary to do the following:

(1) If the customer has more than one computer on which the package can be run, it will probably be necessary to get it running on these other computers also.
(2) Due to the short time during which the vendor is on site to assist with implementation, it may not be possible to get the package processing at optimum speed. Therefore additional experimentation with I/O devices and channel assignments for the package may be necessary.
(3) Training, beyond that provided for in the contract, will usually be required for persons who could not be included in the first training sessions given by the vendor. Additional training may be purchased from the vendor, or else provision must be made for an in-house training course.
(4) The user's documentation, as provided by the vendor, may adequately describe the details of how to use the product. But it will not usually contain all of the information needed by the customer for its effective use. For example, the job control statements will commonly not be complete, due to variations in equipment configurations that the package can run on.

Some additional points regarding implementation are worth mentioning.

(1) The vendor should remain on-site or near at hand during as much of the test period as possible, in order to speed correction and explanation of problems and results.
(2) It is best to start in a small way the usage of the package, especially if it has not been previously field tested.
(3) Provide adequate local documentation and consultation support for the package, so that those for whom the package is intended will be able to make effective use of it.
(4) Establish a "consultation log" on the use of the package so that data on problems and uses can be accumulated for measuring the results of implementing the package.
(5) Maintenance support must be provided in order to insert revisions which the vendor sends out or which the customer may originate (if he has a source deck).

It is reasonable to expect that these additional tasks which the customer must do, to get the package successfully implemented, will cost many times more, in terms of manhours and computer time, than what it took to get the package in the door.

Measuring Results

Measuring the results is an important, though imprecise, aspect of implementing a packaged program. *Tangible* results, based on "before and after" information of the type listed below, can usually be obtained, but not without some cost and difficulty:

(1) Manhours, machine time, and flow time expenditures.
(2) Characteristics of applications of the packaged program.
(3) Training and documentation requirements.

Ideally, this information will be obtained with little effort from those (programmers or others) who are expected to use the new program.

Some of the required information can be obtained (at some cost in machine time) by executing routines for gathering statistics each time the software package is executed. The statistics may be printed as part of the results which are returned to the programmer, or better, may be accumulated on a file for later analysis by another program.

The remainder of the required information can usually be obtained from personal interviews with management, programming, and other staff personnel.

Although large savings are possible through the use of packaged programs, considerable effort and work are required in order to realize the savings. Furthermore, until the job of measuring the savings is complete, no accurate judgement of the real worth of the package can be made.

PROBLEM 692: A STRAIN ON THE BRAINWARE

"Maybe it's economical so far as storage is concerned," Al said, shaking his head, "but it's putting a strain on the brainware."

Bob looked at the sheet Al was working on. "You mean that method you were telling me about — of storing triangular arrays as linear sequences? Where does the strain on the brainware come in?"

"Well, we have to be able to tell where every item is. In the triangular set-up the first row would go from 1 to N, the next row from N + 1 to 2 N − 1, with the N + 1 under the 2, the N + 2 under the 3, and so on."

Bob was beginning to get interested. "Then all the rows were lined up on the right?"

"Yes, right justified as the boss likes to call it."

"Why not just work out the numerical values of the starting points for each row and use those?"

"That would be all right for this array, but the program must be flexible enough to work for any N — actually this program is being written for N up to 100, that is, as many as 5050 entries."

"In other words you're going to have up to 5050 consecutive locations and you want to know where the item that was in I row, J column is?"

"Right! Of course J will always be equal to or greater than I," Al added.

What is the location of the item that was in I row, J column?

Solution to Problem 691: Who Is Missing?

The first column is off by 6; this means a missing F, P or Z. Likewise the second column implies C, M or W is missing, the third, E, O or Y, the fourth, I or S and the fifth, G or Q. The only plausible name that can be read through this block is ZWEIG, probably on the last card, which somehow didn't get included. □

Readers are invited to submit problems (and their solutions) for publication in this column to: Problem Editor, Computers and Automation, 815 Washington St., Newtonville, Mass. 02160.

U.S. Forest Service, Computing Science Branch, 1970-
The University of Arizona: A review of their computing center, February 1971; review 1976
The Bonneville Power Authority: Review of computing and planning, 1972
Washington-Alaska Marine Fisheries Council: Analysis of Fish Catch data base, 1979

Community Service

Seattle Science Center: Public Computer Night, April 1977
Seattle Opera Society: Review of computer services, May 1975
Lakeside School: Development of plan for computer use, March 1974
Bellevue School System: Director for the 70's (Computing) 1969
Seattle Art Museum: Consultant for computerized membership program, November 1977-January 1978

Grants

Principal investigator "Issues and Opportunities: Computing and Higher Education," $95,253 from National Science Foundation 1979-1980

Co-principal investigator "Terminal and Software Facilities," $250,000 from Control Data Corporation, 1970-1973

Co-principal investigator "Software Development for the CDC 2550 Series Host Communication Processor," $150,000 from Control Data Corporation, 1975-1976

Positions

The University of Washington 1969-
Vice Provost for Computing
Lecturer, Computer Science

Responsible for the overall management of computing resources, including academic (research and instruction), administrative, and hospital computing resources.
Responsible for planning, budgeting, and equipment liaison with State and Federal agencies. Previously Director, Office of Academic Computing Services; Director, Computer Center.

The Boeing Company 1966-1969
Chief, Advanced Development

Directed software research and development (including graphics, timesharing, administrative software packages, structured design procedures, experimental MIS development).

  - Responsible for operating system development, computer planning and evaluation as well as a variety of management assignments in operations/ research, simulation, and programming applications (including the first use of PERT, first implementation of multi-program systems, remote systems, etc.).
- **Convair Astronautics 1955-1957**
  - Programming and engineering assignments including the development of the first digital/analog simulation with an early (ERA 1103) digital computer.
    - *NOTE - The "ERA 1103" is also known as the UNIVAC 1103 (see https://en.wikipedia.org/wiki/UNIVAC_1103) ; This was the predecessor to the 1101*
    - *wow - "Even before the completion of the Atlas (UNIVAC 1101), the Navy asked Engineering Research Associates to design a more powerful machine. This project became Task 29, and the computer was designated Atlas II.*
    - *In 1952, Engineering Research Associates asked the Armed Forces Security Agency (the predecessor of the NSA) for approval to sell the Atlas II commercially. Permission was given, on the condition that several specialized instructions would be removed. The commercial version then became the UNIVAC 1103. Because of security classification, Remington Rand management was unaware of this machine before this.* ***The first commercially sold UNIVAC 1103 was sold to the aircraft manufacturer Convair, where Marvin Stein worked with it.****"*
    - **[https://en.wikipedia.org/wiki/Engineering_Research_Associates]Engineering Research Associates**, commonly known as **ERA**, was a pioneering computer firm from the 1950s. ERA became famous for their numerical computers, but as the market expanded they became better known for their drum memory systems. They were eventually purchased by Remington Rand and merged into their UNIVAC department. Many of the company founders later left to form Control Data Corporation.

Foreword

Supercomputers: Government Plans and Policies, presents a review of the Federal Government's large-scale computing programs and examines the networking and software programs within selected agencies. Certain management and institutional questions pertinent to the Federal efforts are also raised and discussed.

This background paper was requested by the House Committee on Science and Technology. Within the past 2 years, there has been a notable expansion in the Federal supercomputer programs and this increase prompted the committee's request for a review of issues of resource management, networking, and the role of supercomputers in basic research.

OTA gratefully acknowledges the contributions of the many experts, within and outside the government, who served as workshop participants, contractors, and reviewers of this document. As with all OTA reports, however, the content is the responsibility of OTA and does not necessarily constitute the consensus or endorsement of the workshop participants or the Technology Assessment Board.

Housatonic

David B. Gise (born 1812)

Born : *April 16, 1812* ([HP000L][GDrive])

Died :

Father is **George Adam Geise Jr.** (born 1772)

Children include :

- **William Franklin Gise** (born 1835)
  - **Children include :**
    - William Kern Gise (born 1871)
    - <others>
- **Daniel Kerlin Gise** (born 1843)
  - **Children include :**
    - **Lloyd Preston Gise** (born 1873) (Father of Lawrence Preston Gise (born 1915) , and Great grandfather of **Jeff Preston Bezos**)
    - <others>
- **Jacob Kerlin Gise** (born 1849)
  - Children include :
    - Grace S Gise (born 1886)
    - William John Gise (born 1888)
      - Father of Lt .Colonel William John Gise (June 23 1920 to March 23 2015)
    - <others>
- David K Gise (1838)

David B. Gise (or "Geiss") : Born April 16 1812, passed June 29 1899

Source : "Will-Grundy Counties, Illinois, Genealogical Society Quarterly : 1988-1989 Volume VII, Number 1" [HP000L][GDrive]

- His parents were **George Adam Geiss** and **Susannah Geiss**. Before her marriage, his mother was a **Miss Bright**.
- On August 18, 1834 he was married to Miss Sarah Kerlin.
- Sarah passed in 1959 - And he remarried his wife's sister Catherine Runkle

Thirty Years in Will County

***David B. Gise**, for over thirty years a resident of Will county, died at his home in Manhattan township, June 29, 1899. He was born in Berks county, Penn., April 16, 1812 and came to Illinois in 1868. He leaves four boys and two girls, W.F., of Chicago; David K., of Center Hall, Pa.; Jacob K., of Beloit, Kan.; Daniel K., of Joliet; Mary J. Brisbin, of Girard, Kan.; and Annie Klingler, of Manhattan. Mr. Gise was one of the best known residents of Manhattan, and liked equally for his nobility of character and his generous nature. The funeral occurred from the late residence three and one-half miles southwest of Manhattan village at 10 a.m. [From The Joliet News of July 6, 1899.]*

David B. Geiss

David B. Geiss, who died June 29 last, was born in Lebanon county, Pa., April 16, 1812. His parents were George Adam Geiss and Susannah Geiss. Before her marriage, his mother was a Miss Bright. On August 18, 1834 he was married to Miss Sarah Kerlin. This union was blessed with twelve children, of which six are still living. In 1859 his companion departed this life, and in 1860 he was again married to Mrs. Catherine Runkle, a sister of his first wife, who preceded him thro' death in 1890. The six children still living are: William F., in Chicago; David K., Center Hall, Pa.; Daniel K., Joliet, Ill.; J.K., Beloit, Kan.;Mary J., Girard, Kan., and Anna C., Manhattan, Ill. The only married daughter preceding the deceased, Mrs. Susan Wagner, was the mother of Mrs. Mary Flink, Mrs. Ida Kerlin, Geiss Wagner and Rev. W.J. Wagner.

"Father" Geiss as he was often called, lived in Pennsylvania until 1867, when he came to Illinois, where he reside until his death, on Thursday, June 29, at 11:30 a.m., in Manhattan township, where he peacefully passed into his rest. The cause of his death was old age with its weaknesses ending in dropsy. The departed arrived at the age of 87 years, 2 months and 13 days. He leaves to mourn his departure six children and two step-children, Mrs. John Cronmiller, of Joliet, and J.K. Runkle, who has been residing with him. Also a niece, Mrs. John Johnson, whom he raised from her infancy, and who now resides in Iowa...

The funeral service took place on Saturday, July 1, at 10 a.m. at the old home, Rev,. F.W. Landwer officiating, and who chose for his text Phil. 1:21... the interment took place at the Klingler cemetery by the side of his departed companion.

1875 - Investing in land in Joliet and other states with his brother

Full page - 1875-07-01-the-centre-reporter-centre-hall-pennsylvania-pg-3.jpg / https://drive.google.com/open?id=1BTNX2K2azZHJ4chVRyBSa6Tvxb7miQVY

The Centre Reporter (Centre Hall, Pennsylvania) · 01 Jul 1875, Thu · Page 3

From Illinois.

JOLIET, Will co., Ill. }
June 21st. '75. }

Dear Reporter :—Once again through the silent medium of the pen will I endeavor to converse with your many readers. The spring has been very cold and late. Have not had as much rain as some others fearful we would not get enough for the small grain which is doing well. It has been too cold for corn, and the "Wire Worm" has been damaging the corn on high ground. Chinch bugs are not to be found and potato bugs are very scarce.

Land is changing hands rapidly and at pretty good figures—all the way from $40 to $55 dollars per acre. There has been and is yet considerable of a "southern fever" raging among Pennsvalley folks since D. B. Gise and brother have returned from their visit to the "Sunny South" and letters from relatives there give it a fast impetus. Gise, Lingle, Seltzer and others speak of purchasing a twelve hundred acre tract in Alabama. Some of them intend going to see it after harvest. I shall then give you particulars. Henry Lingle and Peter Vonada have been on a trip to Farmville, Va. Lingle had bought four hundred acres but the man backed out again and therefore neither of them bought. The only reason any of them can give for leaving here is on account of the long cold winters we have in this latitude—for they all know we have a rich and productive soil, and after raising our crops we have Joliet for our market, which with its rolling mills, steel works, foundries, state's prison and direct eastern communication is second to none as a market west of Chicago. It can also boast of having street cars something no other city of its population can boast. Last summer the finest hotel in the city was reduced to ruins by that dread fiend, fire—but Pheonix like it now is almost ready to take the place it occupied before the fire, at the head of the list.

But enough of this, yet allow one word to "Colorado," "Tussey Mountain boy" and "Michiganders." I would like to hear from you all. More anon.

WILL COUNTY BOY.

DIED.

GISE—In Girard, Kas., March 31st, 1912, Daniel Kerlin Gise, aged 69 years and 28 days.

He was born in Berks county, Penn., March 3d, 1843.

While he was yet an infant his father, who was a miller, moved with his family to Center county, Pa. Here he spent his childhood days and grew to manhood, part of the time living close by his father's mill, but later moving on a farm, as his father gave up the milling business and went to farming. His early education was obtained from the common country schools in his vicinity and was completed in an acadamy located in his county. He taught school a short time in his home county, and in the fall of 1865 he accepted a position as clerk in a store in Lewistown, Pa. He followed this business at Lewistown and Reedsville until 1868, when he went to Will county, Illinois, where his father had preceded him by about a year.

In 1870 he was married to Addie A. Kearns, of Lewistown, Pa., and settled on a farm in Will county, Ill., adjoining his father's pl ce. A year or so later he moved to Joliet, Ill., and went into the mercantile business with his brother, W. F. Gise. Here he reared and schooled his family, consisting of four children.

Sometime in the '80's he made a trip to Crawford county, Kansas, and purchased land. He liked the country so well that he talked of moving out, but did not do so until after his father's death. In the spring of 1903 he moved to Girard and purchased a home on North Osage Street, in Higgie's Park, where he resided until his death.

He is survived by his wife and four children, Ward K. and Edith S., of Girard; Lloyd P., of Big Wells, Texas, and Mrs. R. L. Beattie, of Joliet, Ill., and also two brothers and a sister, David K. Gise, of Center Hall, Pa.; Jacob K. Gise, of Beloit, Kas., and Mrs. Peter Klingler, of Manhattan, Ill.

In early life he joined the Lutheran Church, but in later years attended the church in which his wife held membership.

The funeral took place at his late home Wednesday, April 3d, at 2 o'clock, p. m., Rev. A. H. Morrison officiating.

Mr. Gise was a man of intelligence, force, and character, and a public spirited citizen, and will be missed in business as well as social circles. The first the writer knew of him was when he was a young man attending the Aaronsburg (Pa.) Academy as a student. He was a worker there, and continued so through life, accumulating considerable property and providing well for those dependent on him.

DANIEL K. GISE, senior member of the firm of D. K. Gise & Co., stands at the head of one of the important manufacturing interests of Joliet, operating a factory which turns out door hinges and other articles in this line. The office occupies No. 111, St. Louis Street, while the residence of Mr. Gise is located at No. 201, Sherman Street. Mr. Gise has been a resident of this county since 1868, and for the space of a dozen years has been associated with its leading interests. A native of Lebanon County, Pa., Mr. Gise was born March 3, 1843, and is the son of David B. Gise, a native of Newmanstown, that State. The latter was reared to manhood in his native State, and was there married to Miss Sarah Kerlin. The wife was of English descent, her progenitors settling in Pennsylvania at an early day. Both families were of eminent respectability and the male members largely millers by trade. The parents of our subject, when he was an infant of three months, removed to Center County, Pa., where the father followed milling and farming and where the mother died.

In 1867, after the death of his wife, David Gise emigrated to Illinois with his family, settling south of Manhattan, in Wilson Township, this county, where he now lives. Daniel K. was reared to mature years in Center County, Pa., and after reaching manhood engaged in mercantile pursuits until coming to this county. He then purchased land in Manhattan Township, which he brought to a good state of cultivation, erecting thereon suitable farm buildings and where he resided until about 1872; then removing to Joliet he purchased a stock of goods and established himself on Washington Street, where he continued to do business until 1882. That year he sold out and, after an interval of rest, became interested in live stock in the West, which engaged his attention for a time, and he then established his present business which he has conducted about five years. He still retains possession of his farm property in Manhattan Township. Gise & Co. sell the product of their manufactory principally to the jobbing and retail trade, having men on the road at all times.

Mr. Gise was married, February 10, 1870, in Mifflin County, Pa., to Miss Addie A. Kearns who was born in that county August 27, 1847. The parents of Mrs. Gise were Thomas and Mary (Settle) Kearns, natives of Pennsylvania and now deceased. Four children have been born to our subject and his good wife, these bearing the names respectively, of Ward K., Lloyd P., Buelah A. and Edith S.

Mrs. Gise is a member in good standing of the Central Presbyterian Church. Mr. Gise gives his political support to the Democratic party but meddles very little with public affairs, preferring to devote his time and attention to his business interests and his family.

WASHINGTON ITEMS.

WASHINGTON, Nov. 10.—Minister Lincoln called at the White House to-day and had a pleasant interview with the President, in the course of which he said he would leave for Chicago this evening and expected to remain there until his return to London about the end of December.

The following National banks were to-day authorized to commence business: The First National Bank of Sewickley, Sewickley, Pa., capital $50,000; the First National Bank of Itasca, Itasca, Texas, capital $50,000.

Bids were opened at the Treasury Department to-day for the construction of a public building at Port Townsend Washington, the lowest being that of Gise and Eisenhess, of Port Townsend, at $68,800.

Mr. Gise was married, February 10, 1870, in Mifflin County, Pa., to Miss Addie A. Kearns who was born in that county August 27, 1847. The parents of Mrs. Gise were Thomas and Mary (Settle) Kearns, natives of Pennsylvania and now deceased. Four children have been born to our subject and his good wife, these bearing the names respectively, of Ward K., Lloyd P., Beulah A. and Edith S. Mrs. Gise is a member in good standing of the Central Presbyterian Church. Mr. Gise gives his political support to the Democratic party but meddles very little with public affairs, preferring to devote his time and attention to his business interests and his family.

CORNELIUS J. McCLURE. In traveling about Will County one is struck by the appearance of neatness and order which many of its homes bear and the evidences of thrift and enterprise which are to be seen on every hand. These features are noticeable in contemplating the estate occupied by the above-named gentleman, which comprises one hundred and sixty acres, on section 19, Manhattan Township. It is evident that the manager of this place is successfully pursuing his avocation, which is plainly seen to be that of grain and stock-raising. Holstein cattle and Poland-China swine of good grades graze over the broad acres, and some twenty head of high-grade draft horses are also visible. Investigation reveals the fact that Mr. McClure has recently suffered the loss by fire of a large barn, 10x70 feet, and other buildings, but that substantial structures will soon replace the temporary shelter which he

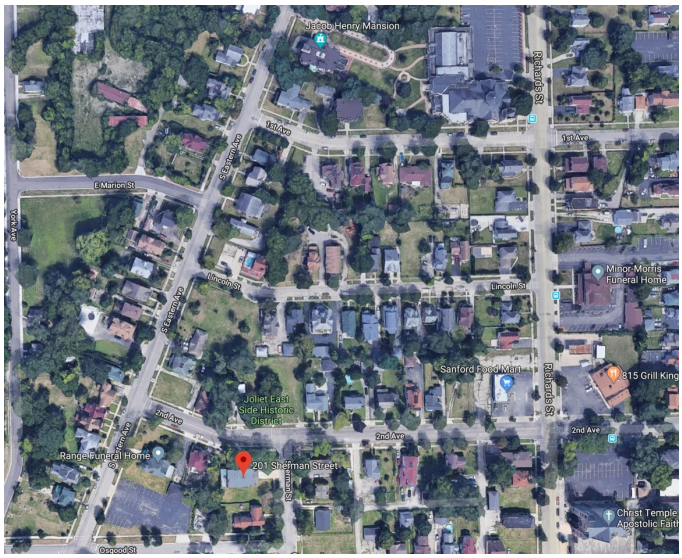
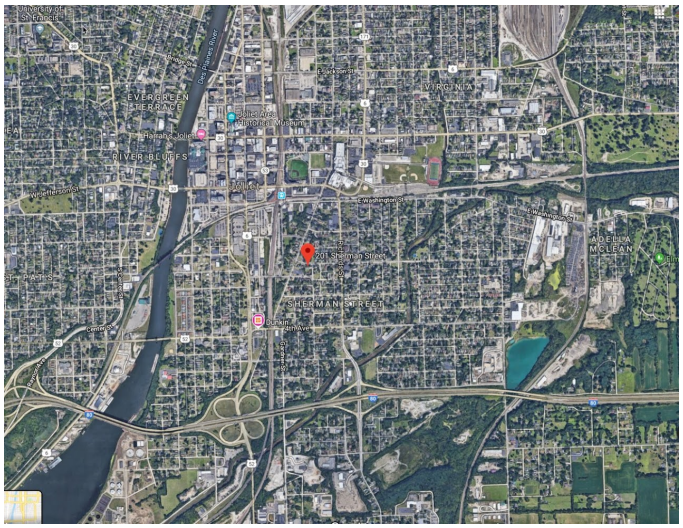
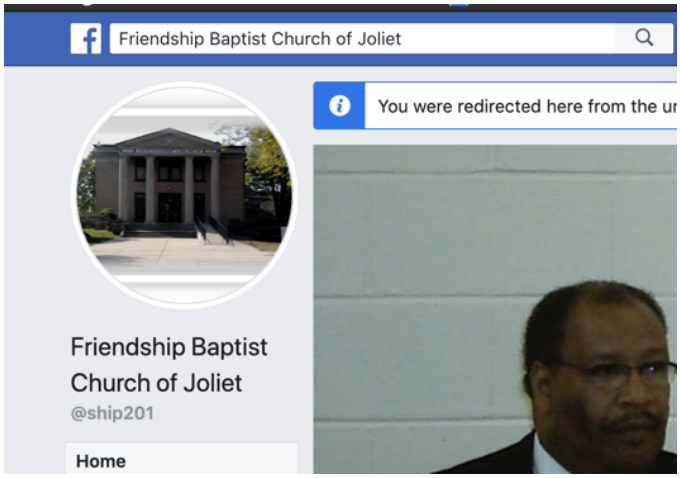
Four children have been born to our subject and his good wife, these bearing the names respectively, of Ward K., Lloyd P., Buelah A. and Edith S. . Mrs. Gise is a member in good standing of the Central Presbyterian Church. Mr. Gise gives his political support to the Democratic party but meddles very little with public affairs, preferring to devote his time and attention to his business interests and his family.

201 Sherman Street, Joliet, Illinois

201 Sherman Street looks like a large home, but is currently serving as the Friendship Baptist Church in Joliet, Illinois.







1903 - Moves to Girard, Kansas (in county where he purchased land)

1907 - Daniel K Gise - Drilling

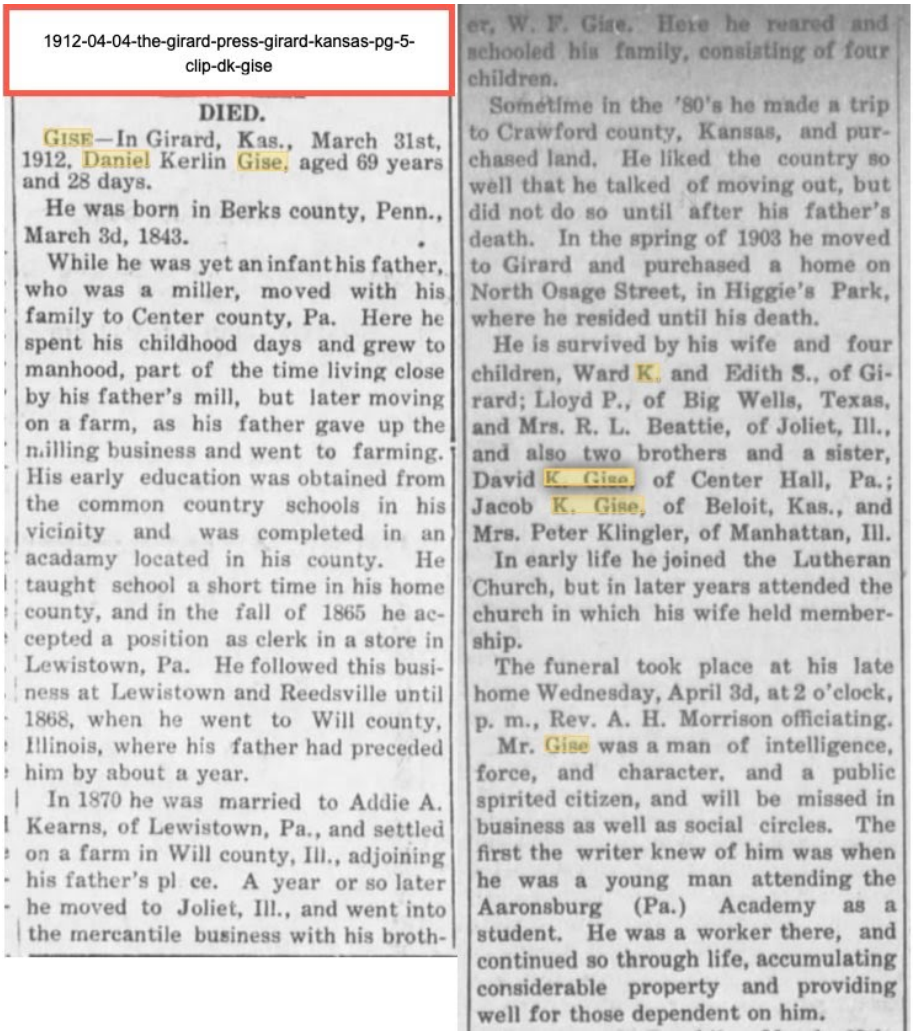
April 04 1912 - Passing of Daniel Kerlin Gise

Full newspaper page : [HN00CH][GDrive]

"In 1871, [Daniel Kerlin Gise moved to and] settled on a farm in Will Country, Illinois, adjoining his father's place. A year or so later, he moved to Joliet, Illinois, and went into the mercantile business with his brother [William Franklin Gise (born 1835)]. Here he reared and schooled his family, consisting of four children. "



1912-04-04-the-girard-press-girard-kansas-pg-5-clip-dk-gise

DIED.

GISE—In Girard, Kas., March 31st, 1912, Daniel Kerlin Gise, aged 69 years and 28 days.

He was born in Berks county, Penn., March 3d, 1843.

While he was yet an infant his father, who was a miller, moved with his family to Center county, Pa. Here he spent his childhood days and grew to manhood, part of the time living close by his father's mill, but later moving on a farm, as his father gave up the milling business and went to farming. His early education was obtained from the common country schools in his vicinity and was completed in an acadamy located in his county. He taught school a short time in his home county, and in the fall of 1865 he accepted a position as clerk in a store in Lewistown, Pa. He followed this business at Lewistown and Reedsville until 1868, when he went to Will county, Illinois, where his father had preceded him by about a year.

In 1870 he was married to Addie A. Kearns, of Lewistown, Pa., and settled on a farm in Will county, Ill., adjoining his father's pl ce. A year or so later he moved to Joliet, Ill., and went into the mercantile business with his brother, W. F. Gise. Here he reared and schooled his family, consisting of four children.

Sometime in the '80's he made a trip to Crawford county, Kansas, and purchased land. He liked the country so well that he talked of moving out, but did not do so until after his father's death. In the spring of 1903 he moved to Girard and purchased a home on North Osage Street, in Higgie's Park, where he resided until his death.

He is survived by his wife and four children, Ward K. and Edith S., of Girard; Lloyd P., of Big Wells, Texas, and Mrs. R. L. Beattie, of Joliet, Ill., and also two brothers and a sister, David K. Gise, of Center Hall, Pa.; Jacob K. Gise, of Beloit, Kas., and Mrs. Peter Klingler, of Manhattan, Ill.

In early life he joined the Lutheran Church, but in later years attended the church in which his wife held membership.

The funeral took place at his late home Wednesday, April 3d, at 2 o'clock, p. m., Rev. A. H. Morrison officiating.

Mr. Gise was a man of intelligence, force, and character, and a public spirited citizen, and will be missed in business as well as social circles. The first the writer knew of him was when he was a young man attending the Aaronsburg (Pa.) Academy as a student. He was a worker there, and continued so through life, accumulating considerable property and providing well for those dependent on him.

DAVIS KEARNS-PRESTON

Commerce Department Official

Davis Alvin Kearns-Preston, 79, a retired Commerce Department economist and founder of the Silver Spring Presbyterian Church, died March 14 at Suburban Hospital. He had a heart ailment.

A supervisory international economist, he spent 30 years with Commerce before retiring in 1973. His last post was as Near East and South Asian division director in Commerce's international trade office.

Mr. Kearns-Preston, who lived in Silver Spring, was a native of Ohio and moved here in 1943. He was a 1933 graduate of the University of Illinois, where he received a bachelor's degree in education.

J. K. Gise,

GRAIN DEALER.

Mr. Gise has been a resident of Mitchell counnty for 22 years, which is about as far back as its history dates. Like nearly all of the influential business men of this state he commenced his career as a tiller of the soil. There is scarcely a business man which would not be benefitted by a man's farming experience and this is especially so with buying grain. Mr. Gise came to Belot three years ago and purchased what has been known for years as the Alliance elevator. With a keen foresight into the grain situation hehas built up a large trade and by dealing squarely with his patrons he intends to increase it. His elevator is one of the best equipped and largest in this vicinity, having a capacity of 16,000 bushels. A good grain market makes a good city, and in no indirect way is Mr. Gise is helping make Beloit one of the best cities of its class in the state.

The Beloit Gazette (Beloit, Kansas) · 18 May 1921, V

James—Mrs. Alfred James died at her home in this city Sunday noon, May 14, following an illness of only a few days. Ardie B. Gise was born near Joliet, Ill., Will county, Ill., January 15, 1873, and died May 14, 1921, at the age of 48 years and 4 months. She came to Kansas with her parents in February 1889 and settled near Plum Creek and at their home was married twelve years later to Alfred W. James who survives her. Three children survive: Lloyd A. James of Topeka; Ralph W. James and Edith Luella James, both of Beloit. She is also survived by her father, J. K. Gise four sisters, Elsie L. Gise and Mrs. Fred White of Beloit, Mrs. Chas. Kirgis of Cawker City and Miss Grace Gise of Washington, D C., and three brothers, A. D. Gise of Coffeyville, Kans., Dan F. Gise of Beloit and Will J Gise of Sacremento, Calif

Mrs. James was a valued member of the Baptist church. She was a woman admired and highly erspected not only by members of her family but by a large circle of friends. The relatives have the heartfelt sympathy of the entire community in the loss of one whose place can never be filled.

The funeral services were held yesterday afternoon at 2:30 o'clock at the Baptist church conducted by the Rev. L. B. Parker. Interment was made in Elmwood cemetery

---

william c gise - Many spellings of wife's last name ("Lawton" , "Lawson", "Layson", etc...)

1895 - https://newspaperarchive.com/connersville-daily-examiner-feb-05-1895-p-2/ <---land purchase

1885 - married - https://newspaperarchive.com/connersville-times-sep-30-1885-p-7/ (here it is "Celia D. Lawson")

1895 - William C Gise was a Navy officer

We are not 100% sure this is the same "William C. Gise". There is very little information to work with here.

The Los Angeles Times (Los Angeles, California) · 02 Jul 1895, Tue ·

ANNAPOLIS CADETS.

A Batch of Newly-fledged Officers Given Assignments.

(REGULAR ASSOCIATED PRESS REPORT.)

WASHINGTON, July 1.—Secretary Herbert today made the assignment of the Annapolis cadets to the different corps in the navy. These are the six-year cadets. They have recently passed an examination and now become full-fledged officers. They are as follows:

To be ensigns—Wilfred F. Poulson, William S. Montgomery, Frank H. Clark, Jr., Henry H. Ward, Eugene L. Bissell, Edward H. Campbell, Charles J. Lang, Walter C. Crossley, William C. Gise, Thomas Wilson, Henry A. Pearson, Orton P. Jackson, Frank L. Chadwick, John S. Dodridge, Percy N. Olmstead, Christopher C. Ewell, Frank B. Upman, John L. Stecht, Richard S. Douglas, Alfred A. McKethan, Alfred A. Pratt.

To be assistant engineers—Maurice B. Peugnel, Henry B. Price, Martin E. Trench, Frank D. Read, Frank R. Brady, Allen M. Cook, Emmett R. Pollock, Andrew M. Porter.

To be assistant naval constructor, Daniel S. Nutting, Jr.

To be second lieutenant, Louis J. Magill.

An effort is being made to secure places for the three young men who were not recommended by the academic board in the revenue marine service, where they would enter as third lieutenants.

1900 to 1901 : Captain of USS Sylph (PY-5) (US Presidential Yacht) for President McKinley

US Naval Academy Information

US Naval Academy Virtual Memorial Hall Entry : [HI0002][GDrive]

WILLIAM K. GISE, LCDR, USN : William Gise '93

William Kern Gise was admitted to the Naval Academy from Illinois on June 14, 1889.

William Kern Gise "died while on duty" on June 28, 1909 as the executive officer of the naval station at Tutuila, Samoa. **Unable to determine the circumstances of his death, but there is nothing to suggest it was operational in nature.**

Register of Alumni gives date of death as June 29 but no other information.

He was survived by his mother and two siblings; he is buried in Arlington National Cemetery. (William's body was originally buried in Samoa, but re-interred in September 1910.)

In 1906 he was stationed in the Washington, D.C. area; as a Lieutenant he was in charge of "a battalion of marines and bluejackets" during a funeral at Arlington National Cemetery.

He was a veteran of the Spanish-American War, having served in Texas during the Battle of Santiago. He at one time commanded the presidential yacht Sylph.

William K Gise was born on month day 1871, at birth place, Illinois, to William Franklin Gise and Millie Gise.

William had 2 siblings: Edgar Kern Gise and one other sibling.

William lived in 1880, at address, Illinois.

William passed away on month day 1909, at age 38 at death place, American Samoa.

He was buried at burial place, Virginia.

Candidates for Mason's Cadetship.

WASHINGTON, D. C., Jan. 19.—Congressman Mason has completed the examination of the papers of those examined for the cadetship at West Point. The two having the highest general average were Louis H. Bash, residing at No. 359 Washington boulevard, and William K. Gise of No. 1045 Monroe street. The average of Bash was 97 1-5 and Gise 92. None of the others had a general average above 90, and most of them below 85. Mr. Mason left for Chicago this morning, ostensibly for the purpose of attending to several law cases he is interested in.

THE STATE CAPITAL.

Grand Jury Investigation of County Officers—Naval Cadets.

[Special Dispatch to the Baltimore Sun.]

ANNAPOLIS, MD., July 1.—The grand jury reconvened today and several witnesses were before the body, which is continuing its investigation into the account of county officials. The grand jury received the report of Accountant Rogers. Dr. R. H. Green, J. O. Fowler and Charles Himelheber, who had been connected with the school board, were also examined, in all nine witnesses being examined. Fourteen others have been summoved in alleged liquor violations at Brighton Beach, Anne Arundel county.

Secretary Herbert today made the assignments of the Annapolis cadets to the different corps of the navy. These are the six-year cadets. They have recently passed an examination and now become full officers. They are as follows:

To Be Ensigns—Wilfred V. Powelson, William S. Montgomery, Frank H. Clark, Jr., Henry H. Ward, Eugene L. Bissett, Edward H. Campbell, Charles J. Lang, Walter S. Crosley, William K. Gise, Thomas S. Wilson, Henry A. Pearson, Orton P. Jackson, Frank L. Chadwick, John S. Doddridge, Percy N. Olmsted, Christopher C. Fewell, Frank B. Upham, John L. Sticht, Richard S. Douglas, Alfred A. McKethan, Alfred A. Pratt.

To Be Assistant Engineers—Maurice B. Peugnet, Henry B. Price, Martin E. Trench, Frank D. Read, John R. Brady, Allen M. Cook, Emmet R. Pollock, Andre M. Proctor.

To Be Assistant Naval Constructor—Daniel C. Nutting, Jr.

To Be Second Lieutenant—Louis J. Magill.

An effort is being made to secure places for three young men who were not recommended by the academic board in the revenue marine service, where they would enter as third lieutenants.

John McVarnish, employed as quartermaster at the academy for the past twenty-three years, died today, aged fifty-five years. He was born in Scotland and was a member of the Naval Veterans' Association.

S. P. Cheeseman was arrested this afternoon charged with embezzling $1,000 from the Consumers' Meat Company, of which he had been manager. James H. Murdock went bail. A hearing will be had before Justice Flood Tuesday.

Horace Leaman, of Baltimore, died in Annapolis tonight. Leaman was an oysterman and has resided in Annapolis several years. He was about thirty-five years old. His mother and other relatives live in Baltimore.

The Evening Star

WASHINGTON, D. C., FRIDAY, FEBRUARY 9, 1900—SIXTEEN PAGES.

A NATION'S TRIBUTE

Funeral of the Late Major General Henry W. Lawton.

TRIBUTES TO THE DEAD HERO

Sermon Delivered by Rev. Dr. H. M. W. Stryker.

MEMORABLE OCCASION

He who dies for home and country
Cannot die in vain;
Memory of his deeds shall linger—
Deathless is his fame.

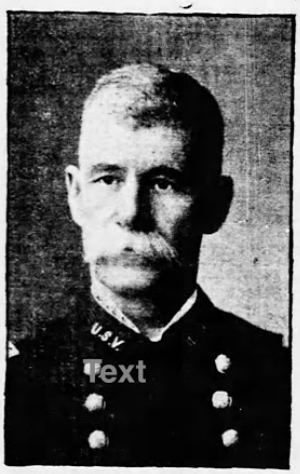
Battle fame is still eternal;
Suns and stars illume;
Love and Truth can never perish—
Triumphs o'er the tomb.

Lawton's fame shall live forever;
Sound his praises high;
Grave upon the sculptured marble—
Worth can never die!

JOHN A. JOYCE.

The nation today paid its last mournful tribute to all that was mortal of Henry Ware Lawton, a peerless patriot, a heroic soldier, a noble and modest gentleman, and around his bier there were gathered all the most distinguished representatives of the Union he had loved so well and served so faithfully, and in whose behalf he had gone unto death, a sacrifice to the duty which was his ideal.

The President of the United States and his cabinet, the members of the Supreme Court, the officers of the army and navy were present in the Church of the Covenant, while elsewhere were thronged the great crowds who represented the people who are the nation. Nearly all the available troops remaining in the country were called out, and 3,000 soldiers gathered to follow the flag-draped caisson to the grave, but in the crowds that surrounded the church and lined the streets and avenues along which the cortege is to pass and have assembled at Arlington the greater significance of tribute was exemplified.



Lawton was to the people the ideal American soldier, whose exploits in three wars made his name a household word, and who, being a soldier first and only, died in the line of duty, leaving nothing to his children but the heritage of an honorable name. It was in tribute to this soldierly ideal that American generosity for weeks past had swelled "the Lawton fund" beyond all expectation of its originators, and in further tribute today that the great outpouring of citizens filled the streets long before the hour when the services at the Church of the Covenant were to commence over the hero whose remains had lain in state under military guard through the silent watches of the night.

The guard, cavalrymen from Lawton's old command, stood at each end of the catafalque, silent and motionless as uniformed statues, and the hush of the silent church was broken only by the soft tread of those who with bowed heads came to pay their last, silent tribute to the brave.

A Distinguished Gathering.

Mrs. Lawton and the members of her family occupied a front pew, and among the early arrivals was President McKinley, who was accompanied by the Secretary of War. The Secretary of the Interior, the Secretary of the Navy, the Secretary of Agriculture, the Attorney General and the Postmaster General were also present. The United States Supreme Court was represetned by Chief Justice Fuller and several of the associate justices.

Admiral Dewey is absent from Washington, but was represented by Captain A. S. Barker. Ex-Secretary Alger was also present by proxy, having sent from Michigan Mr. Victor Mason, his secretary while in the War Department. The military committees of both House and Senate were present, as well as all the senators and members who could gain access to the church. Army and navy officers in uniform filled most of the forward pews and a press of citizens stood up at the rear and in the wide vestibule beyond the doors.

The Pallbearers.

The honorary pallbearers were Rear Admiral A. S. Barker, representing the navy; Maj. Gens. Miles, Brooke and Shafter, representing the army; Brig. Gen. Breckinridge, representing the corps to which Gen. Lawton belonged; Senators Hawley and Sewell, representing the Senate; ex-Gov. Hull of Ohio; Col. Steele and Mr. J. M. Robinson of Indiana, representing the House of Representatives; Gen. J. M. Wilson, representing the Loyal Legion; Col. Farnsworth, representing the Grand Army of the Republic; Col. Greighton Webb, U. S. V., representing the officers on Gen. Lawton's staff during the Santiago campaign; Col. M. E. Urell, representing the veterans of the Spanish war.

There were delegations present from the Military Order of the Loyal Legion and the Grand Army of the Republic. The first was composed of senior vice commander, Rear Admiral Edwin Stewart, United States navy; junior vice commander, Brevet Brig. Gen. Ellis Spear, United States volunteers; chaplain, James H. Bradford, United States volunteers; Gen. Royal T. Frank, United States army; Gen. Henry V. Boynton, United States volunteers; Col. George A. Woodward, United States army; Col. Addison A. Hosmer, United States volunteers; Capt. Benjamin P. Lamberton,

(Continued on Tenth Page.)

LYING IN STATE.

light battery, moving to the rear of officers' quarters on direct road to cemetery, will form line on the open ground between the last set of quarters and the hospital facing the cavalry.

The infantry will form line along the right curb; the foot artillery along the left curb, facing the infantry. The battalion of marines will form line along both curbs in such manner as to equalize the length of line. Arms will be presented by battalion commanders as the remains approach the lines.

The remains will be conducted to the grave by the commanding general and staff, followed by Troop G, 3d United States Cavalry, dismounted, Capt. Hardie commanding, and preceded by the 3d United States Cavalry Band. Troops will remain in above position until after conclusion of the ceremonies, when they will follow the commanding general and staff to the city, to be dismissed and marched directly to their quarters.

The siege battery left the column at the Aqueduct bridge and returned to the barracks.

Gen. Lawton's Horse.

An affecting part of the procession was a dumb mourner. He marched in the rear of the caisson which bore his master's body. He was General Lawton's horse. He wore a black hood over his head, and in the stirrups were the boots that his heroic rider had worn in many a charge. He was led by Private McGarigle. The intelligent animal seemed to realize that he had lost something dear to him.

Early Incidents.

The unauthorized announcement that the Church of the Covenant would be open to the public this morning caused a very large crowd, mostly ladies, to visit the edifice, and Sergeant Lyda of the third precinct,

ister, as the missionaries of the perfect

A NATION'S TRIBUTE

(Continued from First Page.)

United States navy; Col. Green Clay Goodloe, United States marine corps; Maj. John S. Loud, United States army, and Capt. Horace Noble, United States volunteers.

The G. A. R. was represented by Calvin Farnsworth, George H. Slabaugh, B. F. Chase, J. H. Dawes, T. S. Hopkins, S. E. Faunce, Nathan Bickford and John McElroy.

Rev. Dr. Stryker's Sermon.

The Presbyterian burial service was read by Rev. Teunis Hamlin, pastor of the church, and President H. M. W. Stryker of Hamilton College then arose to deliver the oration.

Dr. Stryker said in part:

"Over the width of the earth a soldier's household has brought its warrior home. The dust that the nation gathers to its guarding is that of no common man. We are met to celebrate and to mourn him. But while we recall the record so compact with manliness, and which the white blossom of modesty crowns withal, while we recite the story of one who personified the best American traditions, first this day do we regard her sorrow who treads that 'solemn aisle of pain' the sanctity of whose shadows are accessible only to her God. And with her, we remember, too, for his true sake who begat them, these four dear children—daughters of the army, wards of the people, and son whose best possession shall ever be his father's sword. Orphaned of him indeed his children are, but endowed too with the immutable heritage of a gallant name. It is an estate which with all that appropriately pertains to it this land of pure domestic love will thoughtfully and thankfully administer.

"'Blessed be the God and Father of our Lord Jesus Christ, the Father of mercies and God of all comfort; who comforteth us in all our affliction, that we may be able to comfort them that are in any affliction, through the comfort wherewith we ourselves are comforted of God.'

"Hither we have come—the people's chosen head, and all authorities else from their high several sessions—to pay our poor but tender alms of love to an unblemished memory, to thank Him who is our dwelling place in all generations, that the stout tree of liberty still yields such manner of fruitage, and to pledge ourselves, considering the issue of the lives of our renowned dead, to imitate their unblenching and unblighted faith.

"Station is secondary, humanity is primary. And, whatever else any is, today we all are only men and women, brothers and sisters, lifting as children our wet faces toward the consolations of God. The stars of the spangled flag, covering now this shape of its noble warden, shine multiplied upon the dews of grief. But with a solemn joy, it beseems you, his comrades of the army, to give thanks for the life whose end must (after this parenthesis of difficult farewells) be viewed, not as a calamity, but as a conquest. 'Men unapt to weep' are smitten by the pathos of that courage we commemorate—courage, most touching of all human graces; but let them also smile with exalted hope as they lay upon this soldier's sepulchre the chaplets of their homage."

Without Fear, Without Reproach.

Dr. Stryker eulogized Gen. Lawton's military career, and went on to say:

"This better Plantaganet, this latest Bayard 'without fear and without reproach,' this modern Philippe Sydney, whose life also was 'poetry put into action,' has shown once more of what a stuff is incorrigible manhood—in what substance root the memories that last.

"For a true poet (and so proven) is one who has written at least some things of which no poet that ever lived could have been ashamed, would gladly have owned; and a true man is admitted to the fellowship of heroes by the equality and peerage of his supreme deeds. Here was one whom Raleigh, Gustavus Adolphus, William of Orange, Winkiereid, Cambronne, Garibaldi, would know at sight. He was of that time-enduring breed which has made Agincourt and Naseby and Quebec and Lucknow of immortal story. He was comrade to the Marylanders who guarded the retreat at Long Island, to the men who passed the Delaware, who served the guns of Pleasanton, who soaked the sod of the Peach Orchard, who ran singing through the tide at Manila, who held Guantanamo. The soul was in him of those who did business in great waters with Paul Jones and Lawrence and Truxton and Worden and Bagley—of all the line who yet are with us and which shall not be diminished though all the seas run red. He was in the spiritual loins of Joseph Warren and of Herkimer. He knew the secret and has saluted the souls of Mansfield and Sedgwick and Reynolds and McPherson and Phil Kearney and Custer!

"Let it be said, and let it be said here, that none of us is of those who walk backward into the future and translate the present upside down! A tumid and carping pessimism lives only in the pluperfect, but good faith lives in the future-perfect. The one is subjunctive, the other is indicative. Nay, duty is in the imperative and unconditional mood!

"When, in the name of mankind, and that peace might be real, we undertook in 1898 to cleanse the seas, we affirmed a principle and made a precedent that I, for one, hold to have written the most honorable leaf in all our history. But all that has been since was corrolary to that. No special pleading of professional malcontents with whom wisdom will not dine, no a priori abstraction, can unsay what this dead soldier's zeal said for America. Rather does such a death enjoin upon our purpose and performance such ends as shall vindicate us from cowardly indifferentism and evasion in the face of whatever duty and however unexpected or complex—enjoin us to regard and to teach liberty's authority.

"We do not welcome war, we deplore it; but more deplorable were a craven vacillation toward a riddle which must have room for its solution. For that room's sake, and for the peace it shall secure at last, we reverently invoke upon our arms the favor of the Lord of Hosts' and law of liberty, toward the pacification of the globe, and unto the coronation of that Blessed and Only Potentate, 'having neither beginning of days nor end of years,' who in righteousness judges and makes war, and who is the Prince of Life.

"New meridians of relation, new zones of authority, new horizons of duty—these, with all their concomitant responsibilities; but also with the assurance that He who lades the burden will strengthen the back—that

"'Only the Master shall praise us,
And only the Master shall blame.'

"Our faith, too, must needs be militant, dauntless, ready to die if need were, or else we are unworthy to touch the hem of this pall, which rather let us, in remembrance of one who fought our fight, press to our lips with kisses that are covenants—covenants that we henceforth will stand, as those that are 'baptized for the dead,' to advance our country's true cause, to purify and to exalt it.

"In some good day—not far away, please God—when those islands, foundlings no longer, shall have been rendered as a majestic dedand to civilization, to regulated freedom, and to the God of these, there in fair Luzon, right where he fell, front to his duty, let the valiant frame of this true liberator rise in immutable bronze, while, understanding us at last, our brown brothers, gazing upon that statue, stature, statute, all in one, shall say: 'He was America's; but he is ours, too—Lawton! He was slain by us ignorantly in unbelief; but he has forgiven.'"

As the casket was borne from the church Lieut. Santlemann of the Marine Band raised his baton, and there was a low double ruffle of the drums, and then the band softly began the impressive music of "Safe in the Arms of Jesus."

The Start for Arlington.

The casket, lightened of part of its burden of flowers, was lifted to the shoulders of the troopers and borne down the aisle to the street, past the great crowd outside, where it was raised to the caisson waiting at the door. The waiting ranks of cavalry moved forward and closed about it as a guard of honor. Orders, flung from rank to rank down the crowded avenue, brought troop after troop and platoon after platoon wheeling into line. Then, with a rumble of wheels and clash of trace-chains, field and siege batteries joined the procession, and the hero of three wars moved on his last march to his final resting place on the Virginia hillside beyond the Potomac.

The Route of March.

Thousands of citizens stood with uncovered heads as the caisson passed over the route to the cemetery. The line of march and the order of the procession was as follows:

Connecticut avenue and K street west to Pennsylvania avenue; thence through 24th street to M street; thence west on M street to Aqueduct bridge and Fort Myer, Va.

Platoon of mounted police, Captain M. A. Austin commanding.

Third United States Cavalry Band.

Major General Wesley Merritt and staff.

Squadron 3d United States Cavalry, Major Henry Jackson commanding.

Light Battery M, 7th United States Artillery, Captain M. M. Macomb commanding.

Siege Battery O, 7th United States Artillery, Captain John R. Williams commanding.

Brigade of foot troops, Colonel Francis L. Guenther commanding, and staff.

Regiment United States Infantry, Colonel Edward Moale commanding.

First Battalion, Companies C, D, E and F, 15th United States Infantry, Lieutenant Colonel Constant Williams commanding.

Second Battalion, Companies G, K, L and M, 15th United States Infantry, Major George A. Cornish commanding.

Third Battalion, Companies E, F, G and H, 2d United States Infantry, Captain Edmund K. Webster commanding.

Regiment United States Artillery, Colonel John I. Rodgers commanding.

First Battalion, Batteries E, G, K and N, 4th United States Artillery, Major James M. Lancaster commanding.

Second Battalion, Batteries A, B, L and M, 5th United States Artillery, Major John B. Burbank commanding.

Third Battalion, Batteries C, H and N, 5th United States Artillery, O, 4th United States Artillery, Major Frederick Fuger commanding.

Battalion United States Marines, Major Randolph Dickins commanding.

Salutes by Navy and Army.

The U. S. S. Sylphe, U. S. N., Lieut. W. K. Gise commanding, will fire minute guns as the funeral cortege crosses the Aqueduct bridge, and the guns at Fort Myer will continue the salute until the cortege reaches the cemetery.

On approaching the entrance to the cemetery the column will be formed in two lines, facing each other on opposite sides of the road; the cavalry along the left curb. The

who was in charge, was kept busy courteously announcing to the anxious throngs that they had been victims of an error. A number of fakirs supplied with photographs of Gen. Lawton did a thriving business selling them at a dime each. Within the church photographers occupied every point of vantage with their cameras. About 10:30 o'clock Mrs. Lawton visited the church and remained for some time, and was evidently deeply moved by the many evidences of national and personal esteem for her gallant husband.

Formation of the Escort.

The concentration of the troops forming the escort at the assembling point attracted large crowds, and the scenes were at once impressive and animated. The army has never been so fully represented at the national capital since the Spanish-American war, and as the various commanders moved from their formation points through the streets and avenues they were followed by throngs, braving the increasing discomforts of the chilling breezes, to act as escort to the valorous boys of Uncle Sam.

The squadron of the 3d United States Cavalry, under command of Maj. Henry Jackson, formed on K street, facing south, with its left at Connecticut avenue. The artillery, consisting of Light Battery M, 7th Regiment, under Capt. M. M. Macomb, and Siege Battery O, 7th Artillery, under Capt. John R. Williams, formed in columns of full platoons facing west on K street with the head at Connecticut avenue. Facing east on the latter thoroughfare was the regiment of United States Infantry, under command of Col. Edward Moale. The first battalion comprised Companies C, D, E and F of the 15th Infantry; the second Companies G, K, L and M of the same regiment and the third Companies E, F, G and H of the 2d Infantry. The battalions were commanded, respectively, by Lieut. Cols. Constant, Williams, Maj. George A. Cornish and Capt. Edmund K. Webster. At the left of the infantry, also facing east on Connecticut avenue, was the regiment of artillery under command of Col. John I. Rodgers. It was composed as follows:

First Battalion, Batteries E, G, K and N, 4th United States Artillery, Maj. James M. Lancaster, commanding.

Second Battalion, Batteries A, B, L and M, 5th United States Artillery, Maj. John B. Burbank, commanding.

Third Battalion, Batteries C, H and N, 5th United States Artillery; O, 4th United States Artillery, Maj. Frederick Fuger, commanding.

The United States Marines, forming a battalion under command of Maj. Randolph Dickens, formed on Connecticut avenue, facing east, with the right at N street, the band taking up its position in the small triangular reservation in front of the Church of the Covenant.

Gen. Merritt and Staff.

The commanding general, Maj. Gen. Wesley A. Merritt, and his staff assembled at the Shoreham Hotel at 1 o'clock, and moved thence to the church, taking positions on N street between Connecticut avenue and 18th street, facing south. The brilliant group was composed of the following officers:

Maj. John A. Johnston, assistant adjutant general.

Special aids—Brig. Gen. Alfred E. Bates, U. S. A.; Col. John F. Weston, U. S. A.; Col. Theodore A. Bingham, U. S. A.; Lieut. Col. Henry G. Sharpe, U. S. A.; Capt. Joseph E. Kuhn, U. S. A.; Lieut. T. Bently Mott, U. S. A.

Aids—Lieut. Col. William H. Carter, U. S. A.; Lieut. Col. Culver C. Sniffen, U. S. A.; Maj. William A. Simpson, U. S. A.; Maj. Charles L. McCawley, U. S. M. C.; Maj. Harvey C. Carbaugh, U. S. V.; Capt. Charles G. Treat, U. S. A.; Capt. George O. Squire, U. S. V.

Beautiful Floral Tributes.

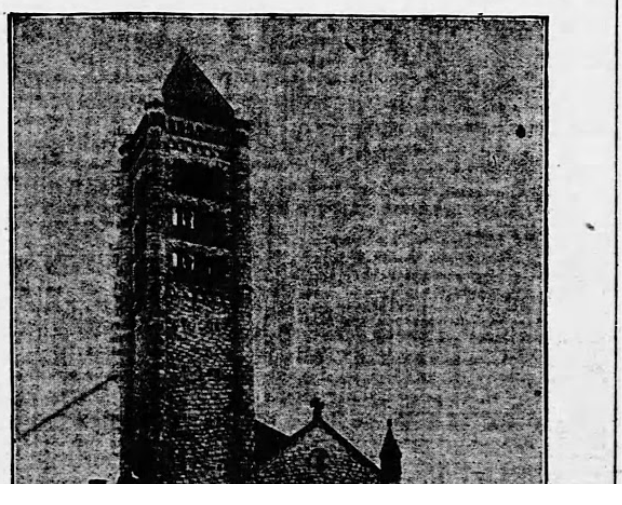
By 1:30 o'clock the escort was in readiness, and meantime the possessors of tickets of admission to the church were already arriving. The distribution of tickets had been made by Col. Theodore A. Bingham and the holders represented the national capital in its most superior sense.

The beauty of the decorations of the church was the theme of whispered admiration, and the effectiveness of the scene was heightened by the magnificence and profuseness of the exquisite floral offerings. The officers of Gen. Lawton's staff were represented by a floral reproduction of the flag of the 8th Army Corps, in white carnations, the emblem in the center being of red. It was sprayed with white orchids and lilies of the valley and bordered by laurel leaves.

Ex-Secretary of War Alger and Mrs. Alger sent a magnificent wreath of galax leaves, white roses, lilies of the valley and orchids, tied with a broad purple satin ribbon. The Loyal Legion sent a magnificent emblem. The Indiana delegation in Congress sent a large shield in red and white carnations and blue cape flowers, crossed with a white bar, bearing the word "Indiana." The tribute of the members of the Philippine commission—Admiral Dewey, Jacob G. Schurman, Dean C. Worcester, Charles Denby and John R. MacArthur—

was a large wreath of galax leaves, green orchids and mignonette. Mr. and Mrs. John Addison Porter's offering was a large wreath of cape flowers resting on an easel, inscribed in blue with the words: "Duty done; rest won." Magnificent wreaths were sent by William Cooke Daniels of Denver, Col., "From Hawaii," Mrs. C. R. Edwards, and a superb cross in white exotics was the tribute of Capt. and Mrs. Irwin. The inspectors' corps of the army sent a beautiful reproduction of the corps badge, a large laurel wreath resting on a crossed floral sword and fasces, and bearing the motto, "Droit et Avant."

Upon the casket rested a superb wreath of white roses, calla lilies, lilies of the valley, orchids and palms, which was sent by the President and Mrs. McKinley.



though we walk through the valley of the shadow of death, we will fear no evil. 'In the name of our God will we set up our banners.'

Summons Comes.

"The Arch-Leader of the migrations of men, the Counsellor 'whose ways are higher than our ways' summons us to an imperial participation in the affairs of the round world—not for conquest and commerce sake, but for Christ's, who is 'the resurrection and the life' for peoples too. He summons us from an isolated even though a continental selfishness, like that in which the palaces of self-contented Babylon became the abode of owls and satyrs—summons us, though we may not yet know the half of it, and though our thoughts are not His thoughts, to min-

Wedding completed - See (https://www.newspapers.com/image/371681621/?terms=gise)

Evening Star (Washington, District of Columbia) • 12 Feb 1900, Mon • Page 7

The marriage of Miss Marie Calhoun Butler, daughter of General and Mrs. M. C. Butler of 1434 N street, to Lieutenant Robert Whitehead McNeely, United States navy, will take place Thursday, February 15, at noon at St. John's Church, this city. Miss Butler's only attendant will be Miss Caroline Thompson of New York. The best man will be Lieutenant W. K. Gise, United States navy, commanding the U. S. S. Sylph. There will be four ushers—Lieutenant M. C. Butler, jr., United States army, brother of the bride-elect, who comes from his regiment, near Havana, to attend the wedding; Lieutenants Mark Bristol and Louis Burton Jones, United States navy, and Lieutenant Savage Bates, United States marine corps. Immediately after the ceremony there will be a breakfast at the bride's residence, to which a few friends have been invited.

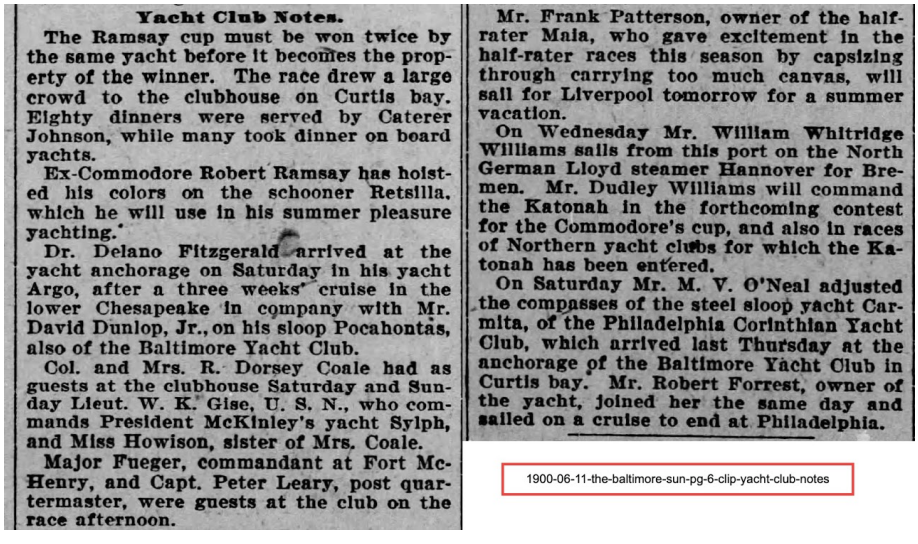
1900 (June 11) - Guests at party - Yacht club ?

Full newspaper page : [HN00BH][GDrive]



Yacht Club Notes.

The Ramsay cup must be won twice by the same yacht before it becomes the property of the winner. The race drew a large crowd to the clubhouse on Curtis bay. Eighty dinners were served by Caterer Johnson, while many took dinner on board yachts.

Ex-Commodore Robert Ramsay has hoisted his colors on the schooner Retsilla, which he will use in his summer pleasure yachting.

Dr. Delano Fitzgerald arrived at the yacht anchorage on Saturday in his yacht Argo, after a three weeks' cruise in the lower Chesapeake in company with Mr. David Dunlop, Jr., on his sloop Pocahontas, also of the Baltimore Yacht Club.

Col. and Mrs. R. Dorsey Coale had as guests at the clubhouse Saturday and Sunday Lieut. W. K. Gise, U. S. N., who commands President McKinley's yacht Sylph, and Miss Howison, sister of Mrs. Coale.

Major Fueger, commandant at Fort McHenry, and Capt. Peter Leary, post quartermaster, were guests at the club on the race afternoon.

Mr. Frank Patterson, owner of the half-rater Maia, who gave excitement in the half-rater races this season by capsizing through carrying too much canvas, will sail for Liverpool tomorrow for a summer vacation.

On Wednesday Mr. William Whitridge Williams sails from this port on the North German Lloyd steamer Hannover for Bremen. Mr. Dudley Williams will command the Katonah in the forthcoming contest for the Commodore's cup, and also in races of Northern yacht clubs for which the Katonah has been entered.

On Saturday Mr. M. V. O'Neal adjusted the compasses of the steel sloop yacht Carmita, of the Philadelphia Corinthian Yacht Club, which arrived last Thursday at the anchorage of the Baltimore Yacht Club in Curtis bay. Mr. Robert Forrest, owner of the yacht, joined her the same day and sailed on a cruise to end at Philadelphia.

HIS NEPHEW PROMOTED.

Will K. Gise, a Prominent Veteran in the Late War, Promoted.

J. K. Gise, of this city, is in receipt of a letter from his brother informing him that his son, Will, who had taken active part in the battle of Santiago on the ship "Texas," as head gunner has been enjoying himself of late on the Potomac with President McKinley and wife on their private yacht, the Sylph. Will has been promoted to a lieutenant and is now on his way to San Francisco, from which place he leaves for China to take part in the trouble at that place. Will has made for himself an enviable record in the late war and we'll wager there will be a few Chinamen's pig tails missing if he gets his clutches on them.

[HN00BM][GDrive]

USS Kentucky : Service during 1900 to 1904

See (https://en.wikipedia.org/wiki/USS_Kentucky_(BB-6))

During the summer of 1900, *Kentucky* was fitted out in the New York Navy Yard.[14] On 26 October [1900], during the Boxer Rebellion, she left Tompkinsville, Staten Island for China,[15] passing through Gibraltar[16] and the Suez Canal.[17] On 5 February 1901 she arrived at Manila,[18] and on 23 March she replaced the protected cruiser *Newark* as the flagship of Rear Admiral Louis Kempff.[19] **Between 1901 and 1904, *Kentucky* visited numerous ports in China and Japan, including Chefoo,[20] Wusong,[20][21][22] Nanking,[21] Taku Forts,[23] Hong Kong,[24] Xiamen,[22]Nagasaki,[25] Kobe,[14] and Yokohama.[26] In 1902, *Kentucky* became the flagship of Rear Admiral Frank Wildes, although he moved his flag to the distilling ship *Rainbow* on 12 April 1902.[26] In November 1902, she became the flagship of Rear Admiral Robley D. Evans.[27]**

On 13 March 1904 she sailed from Manila, passing through the Suez Canal and the Strait of Gibraltar, and arriving at New York City on 21 May.[28] After receiving upgrades at the New York Navy Yard, including the addition of smoke ejectors,[29] *Kentucky* joined the North Atlantic Squadron.[30] The battleship participated in the welcome of the British North Atlantic Squadron at Annapolis, Maryland, in October 1905.[30] During the 1906 Cuban Insurrection, she carried Marines to Cuba, embarking them from Provincetown on 23 September, and landing them at Havana, Cuba, on 1 October.[31] She remained there until 9 October, and then returned to New England.[32] *Kentucky* attended the Jamestown Exposition at Norfolk, Virginia, on 15 April 1907,[4] and then participated in exercises off the New England coast.[14]

1903 (Dec 24) -

Full page : [HN00C7][1903-12-23-the-honolulu-advertiser-pg-2-clip-war-fleet]

THE DAY'S DOINGS AMONG UNCLE SAM'S WAR FLEET

Another payday is being urged by the men of the fleet before the war vessels leave Honolulu for Cavite. The pay this week was the wages due the men for November, and their December pay is not due to be turned over to them until the middle of the first week of January.

There are about 3500 men in the fleet and it is estimated that a naval seaman averages about $30 per month. On this basis the men received about $100,000 on last payday, and another payday would fill their pockets with another $100,000. The matter has not reached those in authority.

COLLIERS LEAVE TODAY.

The naval collier Pompey has been coaled and will leave for Cavite via Midway and Guam, at noon today.

The Nan Shang will leave later. It is probable she will get away this afternoon about 5 o'clock. She goes to Guam and Manila. The fleet may not leave Honolulu until December 30 or 31.

EVANS ENTERTAINED AT THE TENNEY'S.

Admiral Robley D. Evans and staff were entertained at dinner last evening at the residence of Mr. and Mrs. E. D. Tenny, Pensacola and Lunalilo strects.

SEBREE COMMENDS STATION.

The Naval Station feels proud of the record it has made in coaling the fleet. The coaling was done under difficulties, considerable time being lost in transporting coal on barges from the docks to the vessels in the stream. First the coal had to be loaded by hand into the carts from the sheds in the Naval Station premises. It then had to be carted across to the weighing scales close to the entrance to dock No. 1, and then carted on to the dock for the Kentucky and to the Pacific mail dock for the Oregon and New Orleans. That for the Wisconsin had to be carted to dock No. 2, quite a distance away. Other coal was also taken from the big pile at the corner of Alakea and Allen streets, which has completely vanished.

In four and a half days Captain Niblack sent 6400 tons of coal to the fleet, and before the vessels leave port 7300 tons will have passed into the warship bunkers. Captain Sebree of the Wisconsin commended the station for the excellent manner in which it had handled the coal proposition.

EVANS VIEWS PEARL HARBOR.

Admiral Evans and staff, commanders of various warships of the fleet and a large number of ladies of Honolulu, were guests yesterday aboard the U. S. S. Iroquois on a cruise to Pearl Harbor and back, all being hospitably entertained at the Peninsula by Mr. and Mrs. Clarence Macfarlane. Captain Hugh Rodman commanded the Iroquois and gave Admiral Evans an excellent idea of the channels in the lochs by steaming through them at a rapid gait.

The Iroquois left Honolulu at 10:30 a. m. Upon reaching the channel the tug was sent swiftly through it to the lochs, the newly placed buoys proving a great advantage to the commander. The Admiral was shown the site for the navy yard. After cruising all through all the lochs the vessel was moored off the Macfarlane premises where the large party disembarked at 12:30. The guests discussed one of the finest luncheons ever served on the Peninsula and were most hospitably entertained during the afternoon. Dancing was enjoyed in the house and Mrs. George Macfarlane and others entertained the party with several vocal selections. Admiral Evans, in particular, said the outing was one of the best times he had enjoyed in many seasons.

When the Iroquois entered the harbor and swept by the sterns of the Kentucky and Wisconsin the entire party aboard sang "My Old Kentucky Home" to the delight of the Kentucky's men.

Among those who enjoyed the cruise were Admiral Evans, Mr. and Mrs. Clarence Macfarlane, Mrs. George Herbert, Mrs. Helen Noonan, Mrs. Percy Benson, Mrs. Ned Macfarlane, Mrs. F. E. Thompson, Lieut. and Mrs. Washington, Mrs. Clifford Kimball, Miss Rosie Cunha, Miss Macfarlane, Miss Jennie Giffard, Miss Scott, Mrs. Bush, Miss Beckley, Miss Wilhelmina Tenney, Captain Berry of the Kentucky, Captain Sebree of the Wisconsin, Captain Rogers of the Albany, Lieut. Chapin, Lieut. Gise, Captain Davis, U. S. M. C., Medical Director Greene and Surgeon Asserson.

SAILORS WANT INFORMATION.

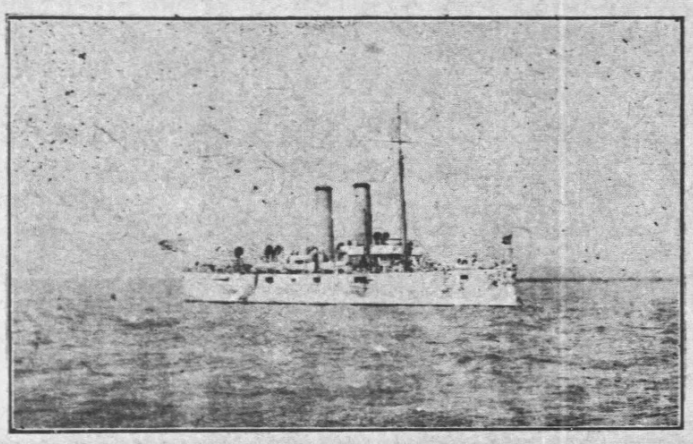
Men from the fleet are getting lots of information about Hawaii from the Hawaii Promotion Committee. Secretary Boyd receives dozens of applications every day and has given away several thousand pieces of literature since the fleet has been in port.

OREGONS WANT TO KICK.

The Oregon football eleven is trying its best to get a game with the Kentucky while the fleet is in port, but say that the men from the flagship are unwilling to meet them. The two teams have tried conclusions twice before this in the Orient, both games resulting in a tie. On the last occasion the Oregon men claim that the Kentucky team made its goal by a fluke, and they are anxious now to demonstrate that they can beat them.

INVITATION FUNCTION SATURDAY.

The reception and entertainment to be given on board the flagship Kentucky and the battleship Wisconsin on Saturday evening is strictly an invitational affair. The invitations are now being issued. It is proposed to make use of both battleships, as they lie on each side of naval dock No. 1, entrance to the vessels being the gate to this dock. The dock will also be made use of on Saturday for the entertainment of the guests.



(Rice & Perkins, Photo.)

SOLACE TOMORROW.

It is expected that the naval transport Solace will arrive here from San Francisco tomorrow morning, having left the latter port on December 18. The Solace brings supplies for the fleet and may have officers for assignment to various vessels.

MAY HOLD FLEET.

It is reported that Governor Carter has been considering the feasibility of cabling to Washington to extend the time of the fleet's stay in this port.

SETTING UP DRILL.

At evening quarters there is no more fascinating scene than the setting up drill which is indulged in by the seamen and marines. The two battleships at the docks give a splendid opportunity to show every man in the vessels going through the movements of the gymnastic drill, consisting of motions with the arms, hands and body. Then the band strikes up and every man fills an individual part of a big circle of men who run at a dog trot about the decks, keeping step to the music. The whole drill is intended as a means of straightening out the muscles and giving the men the fine chests which are the admiration of the American navy.

CHRISTMAS EVE FOR FLEET OFFICERS.

The Alexander Young hotel will be the scene this evening of one of the most elaborate functions yet given for Admiral Evans and the officers of his fleet. The function is in the nature of a public reception to the distinguished visitors and the gathering will undoubtedly be one of large proportions. The formal reception to Admiral Evans and staff, Admiral Cooper and staff, Admiral Terry and staff, and the officers of the warships, will take place in the drawing room of the hotel about 8:30. The officers will be received by Mrs. H. Wingate Lake, Mrs. A. A. Young, Mrs. R. W. Anderson and Mrs. C. C. von Hamm, for the hotel, following which they will be conducted to the roof garden by Manager H. Wingate Lake, where informality will be the watchword. Honolulu society folk, it is believed, will turn out en masse to greet the officers, and the event on the spacious roof will be further enlivened by a concert by the Hawaiian Territorial band, followed by a concert by the band of the flagship Kentucky. Dancing in the two pavilions will commence at an early hour and continue until after midnight. Light refreshments will also be served between 10:30 and eleven o'clock.

The reception and entertainment is for the Honolulu public and as many ladies as can attend are cordially invited by Mr. Lake to be present. It is also hoped that those who have planned Christmas eve entertainments at their homes, will find opportunity later in the evening to attend the function.

Mr. Lake wishes it understood that no special invitations have been sent out save to those in whose honor the reception is to be given; but society may regard itself as hospitably bidden.

EVANS AND STACKABLE.

Collector of Customs Stackable has only praise for Admiral Evans for the manner in which the latter has safeguarded the customs regulations. The customs men have not been on guard near the war vessels, Admiral Evans using his marines as sentries, and orders were issued by him against smuggling. The Collector states that the officers have co-operated with him in this matter in a most creditable manner. Whatever has been brought off from the vessels has been appraised by the Customs officers. Admiral Evans has insisted that all dutiable articles to be brought ashore, be sent to the Customs House to be appraised. A petty officer was awlays sent to the Custom House with sailors who had dutiable stuff to land, to see that the law was not evaded in any way.

1904 (Jan) to 1904 (May)- USS Kentucky leaved Manila, sails to New York City - Lt. WK Gise still assigned to the USS Kentucky

See Wikipedia page on Admiral Evans (https://en.wikipedia.org/wiki/Robley_D._Evans) assigned to the Kentucky, to get insignt on where the Kentucky was ..

Commander-in-Chief – Asiatic Fleet[edit]

Admiral Evans transferred his flag from armored cruiser, USS *New York* (ACR-2) on **4 November 1902 to battleship, USS *Kentucky* (BB-6)at Yokohama, Japan**. On 5 December 1903, the *Kentucky* left Japanese waters for Hawaii; **on 17 December 1903, the *Kentucky* arrived at Pearl Harbor Naval Station, Hawaii**. Admiral Evans hosted a Christmas dinner for the officers of *Kentucky* at the Moana Hotel in Waikiki. 31 December 1903 Evans' flagship departed Honolulu for Guam. *Kentucky* arrived in Cavite, the Philippines, on 18 January 1904. Admiral Evans called on the new Governor-General of the Philippines, Luke Edward Wright, at the Malacanang Palace. Evans' flagship departed Manila on 13 March 1904. The *Kentucky* coaled at Hong Kong and Colombo. Sailing through the Suez Canal into the Mediterranean Sea to the port of Naples, Italy, the voyage continued to Gibraltar, coaling at Madeira; the flagship *Kentucky* arrived at the New York Navy Yard, 23 May 1904. Admiral Evans hauled down his flag, 27 May 1904 from battleship *Kentucky*.

Commander-in-Chief – North Atlantic Fleet[edit]

Evans (left) and President Theodore Roosevelt aboard Roosevelt's yacht, *The Mayflower*

On 31 March 1905, a 13-gun salute was fired by the battleship USS *Maine* at Pensacola, Florida, as the flag of Rear Admiral Robley D. Evans, Commander-in-Chief of the North Atlantic Fleet, was broken at the main mast. The fleet sailed on 7 May 1905 for Hampton Roads, Virginia. Admiral Evans returned to his alma mater the United States Naval Academy at Annapolis, Maryland, on 30 October 1905.

The British Fleet under command of Prince Louis of Battenberg arrived at Annapolis. On 1 November 1905, the Prince visited Evans on *Maine*. Admiral Evans gave Prince Louis a tour of the Naval Academy and battleship *Maine*. A reception by Evans was held later in the week on the *Maine* for Governor Edwin Warfield of Maryland.

Admiral Evans on the flagship *Maine* sailed on 7 November 1905 from Annapolis to New York. Admiral Evans stayed on board *Maine* during repairs from 20 November 1905 to January 1906. After winter quarters in Guantanamo Bay, Cuba, on 3 May 1906, Evans returned the fleet to New York. On 2 September 1906, the *Maine* anchored next to the presidential yacht *Mayflower* off Oyster Bay, Long Island. President Theodore Roosevelt came on board *Maine* to confer with Evans. Admiral Evans o the *Maine* departed New York on 28 December for winter quarters in Cuban waters. On 15 April 1907, Evans' flagship *Maine* returned to Hampton Roads. On 16 April 1907, Evans hauled down his flag on the *Maine* and then hoisted it on the battleship *Connecticut*, flagship for the world cruise.

SOCIETY IN WASHINGTON

A Day Of Charming Weddings In National Capital.

[Special Dispatch to the Baltimore Sun.]

Washington, June 1.—Miss Marian Robbins, daughter of Mrs. Annette Beebe Robbins, of Boston, was married this afternoon to Mr. Laurence A. Janney, of Boston, son of Professor and Mrs. Bernard T. Janney, of Georgetown. The ceremony was performed in the parlors of Stoneleigh Court at 4.30 o'clock in the presence of only the immediate families of the bride and groom. Rev. Henry Hatch Dent Sterrett, of St. George's Church, New York, who was a classmate of the bridegroom, officiated.

The bride was attended by Miss Elinor Holbrook, of Springfield, Mass. Misses Glayds and Marian Lawson, of Boston, daughters of Mr. Thomas W. Lawson, were bridesmaids. The best man was Mr. Elliott B. Robbins, brother of the bride. The bridal party stood within a bower of Southern smilax and white blossoms under a chime of white satin bells, with clappers of Bride roses. A small orchestra was stationed behind a screen of greens. The bridal gown was of Renaissance lace, princess style, made over white chiffon and heavy white satin. A large reception followed the ceremony from 5 to 7 o'clock, after which the couple left for a trip of 10 days before going to their future home in Brookline, Mass.

The wedding of Miss Rita Hamilton Ryan, daughter of Mrs. Arthur B. Ryan, to Mr. Alan Ogilvie Clephane, son of Mrs. Lewis Clephane, took place today at noon in St. Thomas' Episcopal Church, Rev. C. Ernest Smith performing the ceremony. The ushers were Mr. Malcolm Wolcott Clephane, of New York; Mr. Wallace Donald McLean and Mr. Robert S. Hume, of this city; Mr. John H. Ballinger, of Seattle, Wash.; Lieut. William Kern Gise, United States Army, and Mr. Foster R. Greene, of Fall River, Mass. The bride was attended by Miss Beatrice Clephane, the little sister of the groom; Miss Martha Ryan, sister of the bride, was maid of honor; Miss Louise Ryan, Miss Carolyn Nash, Miss Elizabeth Middleton Bryam, of Charleston, S. C., and Miss Claudia Trenholm, of New York, were the bridesmaids. The bride's gown was of white messaline, trimmed with rich duchess lace, an heirloom in the family. Her veil of tulle was held in place with orange and myrtle blossoms, following an old custom of the South. Her only ornament was a brooch of diamonds, the gift of the bridegroom. She was escorted to the chancel by her cousin, Dr. Sterling Ruffin, in the place of her grandfather, ex-Gov. William R. Hamilton, of North Carolina, whose illness prevented his presence. The best man was the brother of the bridegroom, Mr. Lewis Painter Clephane. The bride and groom went for a short wedding tour and will be with the mother of the bride for the early summer.

Miss Anita Evans, daughter of the former consul general to London, will be married at noon on Wednesday to Lieut. David Foote Sellers, U. S. N. The ceremony will take place in St. Thomas' Episcopal Church and will be followed by breakfast for the bridal party only in the home of the bride's parents, on Massachusetts avenue. The family is in mourning for the bride's brother, Lieut. Evans, otherwise there would have been more festivity on this occasion. The bride's sister, Miss Evans, will be her only attendant. The best man will be Lieut. Powell Symington and the ushers will be Lieut. Commander Gibbons, of the Dolphin; Capt. Archibald Butt, Paymaster Izard, Lieut. Roscoe Spear, Capt. Harry Lay, and Lieut. William K. Gise. The wedding will be a brilliant one, as all navy weddings are sure to be The officers will wear full-dress uniform and the guests will be from among the most distinguished official and army and navy families in the city.

MISS ANITA EVANS.

THE WORLD OF SOCIETY

MISS ANITA EVANS AND LIEUT. SELLERS MARRIED.

Noon Ceremony at St. Thomas' Unites the Couple—A Morning Wedding —Other Events—Notes.

The marriage today at noon at St. Thomas' Church of Miss Anita Evans, daughter of the former consul general to London and Mrs. Henry Clay Evans, to Lieut. David Foote Sellers, United States navy, was witnessed by a large and fashionable assemblage, but is likewise today a topic of great interest to hundreds of their friends in Europe as well as in this country. The chancel of the church was abloom with chrysanthemums set amid palms and foliage plants, which decoration extended down the aisle to mark off the family pews. The ushers, all of whom were in the full dress uniform, as were the bridegroom and best man, were Lieutenant Commander Gibbons, Lieut. Roscoe Spear, Lieut. Wm. K. Gise, Lieut. Clarence England, Paymaster W. B. Izard, all of the navy; Capt. Harry R. Lay, United States Marine Corps, and Capt. Archibald Butt, United States army. A very beautiful musical program filled the interval of the assembling of the guests and the arrival of the bridal party. The bride's mother, handsomely gowned in white lace and wearing a stylish and becoming bonnet, in which white lace and jet were combined, was in the front pew on one side of the aisle, while the bridegroom's parents and his brothers sat opposite. The bride was escorted to the chancel by her father, and was preceded by her sister, Miss Nell Evans, as maid of honor. At the chancel railing the bridegroom and his best man, Lieut. Powers Symington, United States navy, awaited. Rev. C. Ernest Smith, D.D., performed the marriage ceremony.

The bride's dress was exceedingly elegant and becoming, its soft, fluffy folds being of white chiffon cloth, but half concealed by deep flounces of Burano lace. This lace formed a bertha on the bodice, edged the elbow sleeves and was festooned up the sides of the skirt. The guimpe was of Valenciennes lace and around the collar gleamed a string of exquisite pearls—a bridal gift. To this beautiful dress was added the train of the costume worn when the bride was presented at the first court held by Queen Alexandra. It is made of brocaded white satin, lined with white satin, fell from the shoulders and is the regulation length—four yards—required for the formal occasion of its first use. Her tulle veil was held by a wreath of orange blossoms and her bouquet, about which a bit of sentiment lingered also, in the choice of blossoms, was a shower bunch of white carnations and lilies of the valley. Altogether a beautiful toilet and worn by a bride whose personal popularity is a matter of general knowledge. Miss Nell Evans, as maid of honor, wore a very smart toilet of white chiffon cloth and lace and a tilted hat of Irish lace and tulle. Her bouquet was of pale pink carnations.

The drawing rooms and dining room at Mr. and Mrs. Evans' home on Massachusetts avenue were profusely adorned with American beauty roses, chrysanthemums, trailing vines and foliage plants, the effect culminating in the arrangement of the floral bower in the drawing room, where the couple stood to receive the congratulations of their relatives, and in the dining room where the party of forty sat at breakfast at eight round tables. Each table had a centerpiece of roses. Owing to the death last summer of Lieut. Evans, only son of the family, no reception was held and all the arrangements for the wedding were greatly simplified.

The bride's presents to be numbered by the hundreds were shown in an upper room. They comprise most valuable and artistic pieces of jewelry, silver, cut glass, pictures, furniture, linen and everything else enviable in the way of personal or household belongings, and were sent by friends in England and all parts of this country.

Lieut. and Mrs. Sellers left this afternoon for their honeymoon journey.

The bride's going-away gown was a Paris make of purple cloth, the bodice trimmed in Irish lace. Her wrap was a deep stole of Russian sable and a large muff of the same splendid fur was carried.

While awaiting Lieut. Sellers' orders, which are to carry him to sea for a couple of years, they will travel or be here with the bride's family or at the old home in Chattanooga, Tenn., where Mr. and Mrs. Evans and Miss Evans expect to spend the winter.

Among the guests from out of town for the wedding were the bridegroom's parents and his brothers, Walter Foote Sellers, Spaulding Foote Sellers and Ned Foote Sellers; Miss Foote of Chicago, Mr. and Mrs. H. H. Benedict of New York, Mr. and Mrs. Archibald Forrest of New York, Miss Margaret Cloud of Pittsburg, Miss Clubb of Baltimore, the Misses McNeely of Philadelphia and Mr. and Mrs. George W. Boyd of Philadelphia.

Among those at the church were Mrs. Fairbanks and Mrs. Timmons, wife and daughter of the Vice President, the former in white cloth, with ermine furs, and the latter in a light gray check; Mrs. Hitchcock, wife of the Secretary of the Interior; Miss Louise Kauffmann, Mrs. Rudolph Kauffmann, Miss Kennedy, Mrs. T. W. Noyes, Mrs. T. C. Noyes, Mrs. Victor Kauffmann, Dr. John C. Simpson, Miss Hagner, Mrs. Mearns, Mrs. George B. Williams and the Misses Colton.

Lieut. David Foote Sellers, U. S. N.

Lieut. Commander Thomas Washington assumes command of the dispatch boat Dolphin at the navy yard, Washington, to-morrow, relinquishing his duties in the Bureau of Navigation, Navy Department, for that purpose. Lieut. Commander Washington relieves Lieut. William K. Gise from command of the Dolphin, Lieut. Gise having been exercising temporary command since Lieut. Commander W. A. Edgar was relieved from command and ordered to the battle ship Ohio as executive officer. Another popular officer who leaves the Bureau of Navigation is Lieut. Rufus Z. Johnston. He is now availing himself of a short leave of absence, and about June 15 he will join the battle ship Minnesota.

Lieut. Commander W. K. Gise, Lieut. Commander Caldwell, Lieut. Arthur B. Keating, Lieut. L. C. Palmer, Lieut. R. K. Crank, Lieut. Ames Bronson, Lieut. Edward McCauley and Paymaster J. H. Merriam, all of the United States Navy, were ushers today in Baltimore at the marriage of Miss Corinne de Forest Montague and Lieut. Henry C. Muston, U. S. N. The bride was attended by her sister, Mrs. Basil Gordon, at whose home the wedding breakfast took place. The other attendants to the bride were Miss Harriet Shields of Philadelphia, Miss Clare Blakestone, Miss Anne Thom and Miss Kitty Robertson.

The two flower girls were the little daughters of Mrs. Gordon, Miss Leilla Sinclair Gordon and Miss Anne Hamilton Gordon. The bridegroom, ushers and best man, Lieut. Col. George Barnette, were entertained at dinner last night by Mr. William S. Lloyd of Philadelphia, stepfather of the bridegroom.

METCALF DISCUSSED PLAN OF VOYAGE

SAN FRANCISCO, June 28.—A conference between Secretary of the Navy Metcalf, Rear Admiral C. S. Sperry, commander in chief of the Atlantic fleet, and Admirals Emory and Wainwright of the third and fourth divisions, concerning matters pertaining to fleet administration and plans for the cruise around the world, was held yesterday on board the flagship Connecticut.

Full naval honors were accorded Secretary Metcalf, with the exception of the secretary's salute, which was omitted at his special request. All officers appeared in special full dress uniform, and Rear Admiral Sperry signaled for Rear Admirals Emory and Wainwright to board the flagship. They responded and joined the secretary and Sperry and his staff at luncheon.

The secretary left the flagship at ' o'clock, going in the admiral's barge to the Oakland mole. The secretary expressed his pleasure at the condition of the ships of the fleet and at the manner in which plans for the world trip are being carried out.

The repair ship Panther will not remain at Honolulu during the entire stay of the fleet, but will leave ahead of he other vessels and carry Lieutenant Commander William Gise to Tutuila, Samoa. Gise has just been detached from the Ohio and ordered to Samoa as commander of the station ship Annapolis. The Glacier will also leave Honolulu in advance of the fleet for Fiji, and through it the fleet will be able to communicate by wireless with the Fiji cable station.

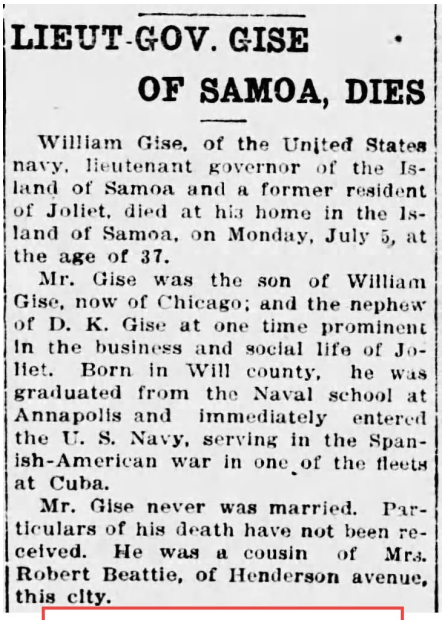
1909 (July) - death - Lieutenant Governor of Samoa

Full page : [HN00BZ][GDrive]



LIEUT-GOV. GISE OF SAMOA, DIES

William Gise, of the United States navy, lieutenant governor of the Island of Samoa and a former resident of Joliet, died at his home in the Island of Samoa, on Monday, July 5, at the age of 37.

Mr. Gise was the son of William Gise, now of Chicago; and the nephew of D. K. Gise at one time prominent in the business and social life of Joliet. Born in Will county, he was graduated from the Naval school at Annapolis and immediately entered the U. S. Navy, serving in the Spanish-American war in one of the fleets at Cuba.

Mr. Gise never was married. Particulars of his death have not been received. He was a cousin of Mrs. Robert Beattie, of Henderson avenue, this city.

ARMY AND NAVY JOURNAL.

Lieut. Comdr. William K. Gise, U.S.N., executive officer of the Annapolis, stationship at the naval station at Tutuila, Samoa, died at that place July 5, 1909. The body will be brought to the United States for interment as soon as suitable arrangements can be made. Lieutenant Commander Gise went out as ordnance officer on the Ohio when the Battleship Fleet began its world cruise in December, 1907. He was transferred to Samoa about the time the fleet left San Francisco. His position at the naval station at Tutuila was a most important one, he acting practically as captain of the yard and having much to do with naval affairs on the island. Commander Gise was born in Dwight, Ill., on June 22, 1871, and entered the naval Service as a naval cadet on June 14, 1889. He was promoted to ensign on July 1, 1895, and served during the Spanish-American War, 1898, on board the U.S.S. Texas. He was promoted to lieutenant (junior grade) on March 3, 1899, and to lieutenant on March 3, 1901, the most important part of his service in the latter grade being as follows: On U.S.S. Kentucky, May, 1903, to June 21, 1904; at Naval Gun Factory, navy yard, Washington, D.C., Aug. 18, 1904, to Jan. 3, 1906; as executive officer, of U.S.S. Dolphin from Jan. 4, 1906, to Oct. 21, 1907. He was promoted to lieutenant commander from Feb. 8, 1907. On Oct. 22, 1907, he reported for duty as ordnance officer of the U.S.S. Ohio, performing that duty until detached on June 27, 1908. From June 28, 1908, to July 26, 1908, he was attached to the U.S.S. Panther. On July 27, 1908, he reported for duty on board the U.S. S. Panther. On July 27, 1908, he reported for duty on board the U.S.S. Annapolis, stationship at the naval station, Tutuila, Samoa, and was engaged upon that duty at the time of his death.

Crew Remembered Naval Commander.

William K. Gise, a nephew of D K Gise, of Girard, died while serving in the United States navy, and his mother, who is a resident of Chicago, received the following letter from his subordinates, proving how highly he was esteemed:

U S. S. ANNAPOLIS,
U S. NAVAL STATION, TUTUILA,
December 9th, 1909.

DEAR MRS GISE:—To express in some degree our appreciation of the ability of the nature of your son, the late Lieutenant-Commander William K. Gise, U. S. Navy, the affectionate regard and admiration in which he was held by all, and the perfect justness and kindness that characterized all his actions toward us, we, the crew of the U. S. S. Annapolis, have subscribed the sum of $500.

We desire to place over his grave in the United States cemetery a monument inscribed with our sentiments According to your wishes, we wish to present you either with a stone that meets with your approval, or with the sum subscribed and have you select the stone.

We trust that you will accept this as indicative of the respect and esteem that we bore your son

Let it also bear to you our deepest sympathy in your great loss

For the crew of the U. S S Annapolis.

W. C. COLEMAN,
Chief Master at Arms.
L P. JONSSON,
Chief Quartermaster.
S F. P. MILLER,
Chief Machinist's Mate.
CHRISTIAN BANER,
C. B. M.

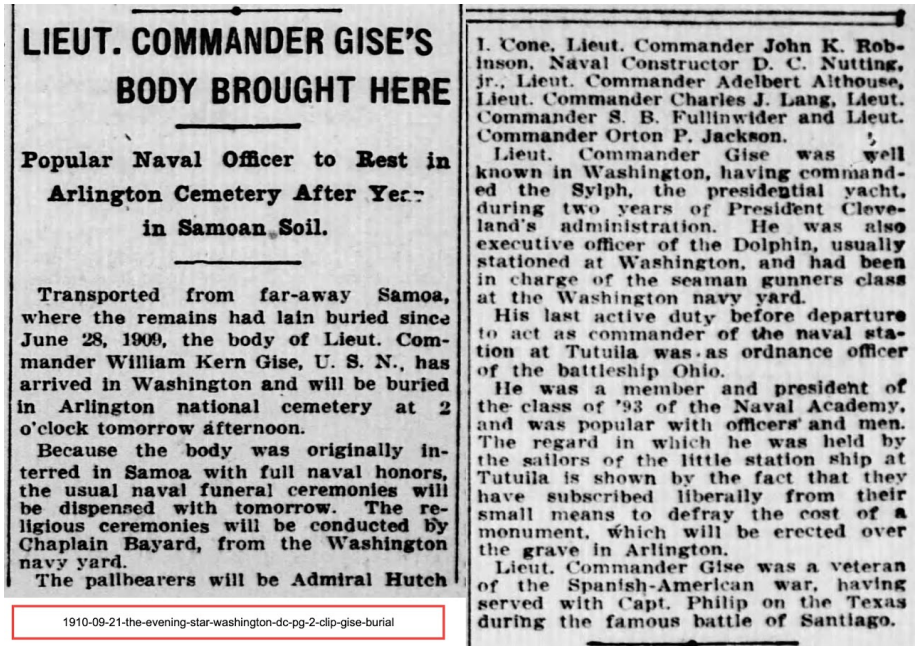
1910 (Sep 21) - Burial - pallbearers

Full newspaper page : [HN00C3][GDrive]



LIEUT. COMMANDER GISE'S BODY BROUGHT HERE

Popular Naval Officer to Rest in Arlington Cemetery After Year in Samoan Soil.

Transported from far-away Samoa, where the remains had lain buried since June 28, 1909, the body of Lieut. Commander William Kern Gise, U. S. N., has arrived in Washington and will be buried in Arlington national cemetery at 2 o'clock tomorrow afternoon.

Because the body was originally interred in Samoa with full naval honors, the usual naval funeral ceremonies will be dispensed with tomorrow. The religious ceremonies will be conducted by Chaplain Bayard, from the Washington navy yard.

The pallbearers will be Admiral Hutch I. Cone, Lieut. Commander John K. Robinson, Naval Constructor D. C. Nutting, jr., Lieut. Commander Adelbert Althouse, Lieut. Commander Charles J. Lang, Lieut. Commander S. B. Fullinwider and Lieut. Commander Orton P. Jackson.

Lieut. Commander Gise was well known in Washington, having commanded the Sylph, the presidential yacht, during two years of President Cleveland's administration. He was also executive officer of the Dolphin, usually stationed at Washington, and had been in charge of the seaman gunners class at the Washington navy yard.

His last active duty before departure to act as commander of the naval station at Tutuila was as ordnance officer of the battleship Ohio.

He was a member and president of the class of '93 of the Naval Academy, and was popular with officers and men. The regard in which he was held by the sailors of the little station ship at Tutuila is shown by the fact that they have subscribed liberally from their small means to defray the cost of a monument, which will be erected over the grave in Arlington.

Lieut. Commander Gise was a veteran of the Spanish-American war, having served with Capt. Philip on the Texas during the famous battle of Santiago.

BROUGHT FROM SAMOA.

Body of Lieut. Comdr. Gise, U. S. N., Buried in Arlington Cemetery.

After having lain buried in Samoa since June 28, 1909, the body of Lieut. Comdr. William Kern Gise, U. S. N., has arrived in Washington, and will be buried in Arlington National Cemetery at 2 o'clock this afternoon. Having received full naval ceremony when originally interred in Samoa, the body will be buried quietly, Chaplain Bayard, from the Washington navy yard, officiating.

The pallbearers will be Admiral Hutch I. Cone, Lieut. Comdr. John K. Robinson, Naval Constructor D. C. Nutting, jr., Lieut. Comdr. Adelbert Althouse, Lieut. Comdr. Charles J. Lang, Lieut. Comdr. S. B. Fullinwider, and Commander Orton P. Jackson.

Lieut. Comdr. Gise was a veteran of the Spanish-American war, having served with Capt. Philips on the Texas at the battle of Santiago, and at one time commanded the Sylph, the President's yacht, during Cleveland's administration. He was well known in this city.

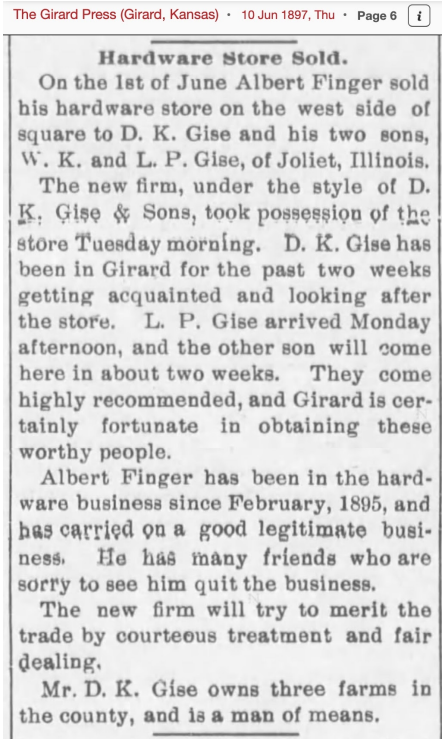
1897 (June 10) - hardware store - Loyd Gise and brothers take ownership

Full page : [HN00MZ][GDrive]



The Girard Press (Girard, Kansas) · 10 Jun 1897, Thu · Page 6

Hardware Store Sold.

On the 1st of June Albert Finger sold his hardware store on the west side of square to D. K. Gise and his two sons, W. K. and L. P. Gise, of Joliet, Illinois.

The new firm, under the style of D. K. Gise & Sons, took possession of the store Tuesday morning. D. K. Gise has been in Girard for the past two weeks getting acquainted and looking after the store. L. P. Gise arrived Monday afternoon, and the other son will come here in about two weeks. They come highly recommended, and Girard is certainly fortunate in obtaining these worthy people.

Albert Finger has been in the hardware business since February, 1895, and has carried on a good legitimate business. He has many friends who are sorry to see him quit the business.

The new firm will try to merit the trade by courteous treatment and fair dealing.

Mr. D. K. Gise owns three farms in the county, and is a man of means.

DEATH VISIT AT GROTH HOME.

Mrs. Lloyd P. Gise Succumbs After Long Sickness.

Death entered the home of Mr. and Mrs. Adam Groth, at 1007 Jackson street, yesterday, and claimed their daughter, Emma Ottilde, wife of Lloyd P. Gise.

The end was not wholly unexpected, as Mrs. Gise had been sick for some time, her condition being critical during the past few days.

The funeral will be Tuesday at 2 p. m., from the house, the Rev. D. C. Milner, of Chicago, officiating. Burial will be in Oakwood.

Mrs. Gise was aged 27 years and 10 months. She was born in Wausau, Wis., March 13, 1879, and came to Joliet with her parents when a child. Here she grew to womanhood, and here she fostered those warm friendships which now unite in mourning the loss of an estimable young woman.

Mrs. Gise was educated in the public schools of this city. June 17, 1903, she was married to Lloyd P. Gise, son of Mr. and Mrs. D. K. Gise, formerly of this city, now living in Girard, Kansas. She leaves besides her husband, a son, Raymond, aged 2½ years, to mourn the loss of a faithful and beloved wife and mother. There is also the parents, a brother, Carl A., and two sisters, Miss Alma and Mrs. Lucy M. Longley.

DIED.

GISE—In Girard, Kas., March 31st, 1912, Daniel Kerlin Gise, aged 69 years and 28 days.

He was born in Berks county, Penn., March 3d, 1843.

While he was yet an infant his father, who was a miller, moved with his family to Center county, Pa. Here he spent his childhood days and grew to manhood, part of the time living close by his father's mill, but later moving on a farm, as his father gave up the milling business and went to farming. His early education was obtained from the common country schools in his vicinity and was completed in an acadamy located in his county. He taught school a short time in his home county, and in the fall of 1865 he accepted a position as clerk in a store in Lewistown, Pa. He followed this business at Lewistown and Reedsville until 1868, when he went to Will county, Illinois, where his father had preceded him by about a year.

In 1870 he was married to Addie A. Kearns, of Lewistown, Pa., and settled on a farm in Will county, Ill., adjoining his father's pl ce. A year or so later he moved to Joliet, Ill., and went into the mercantile business with his brother, W. F. Gise. Here he reared and schooled his family, consisting of four children.

Sometime in the '80's he made a trip to Crawford county, Kansas, and purchased land. He liked the country so well that he talked of moving out, but did not do so until after his father's death. In the spring of 1903 he moved to Girard and purchased a home on North Osage Street, in Higgie's Park, where he resided until his death.

He is survived by his wife and four children, Ward K. and Edith S., of Girard; Lloyd P., of Big Wells, Texas, and Mrs. R. L. Beattie, of Joliet, Ill., and also two brothers and a sister, David K. Gise, of Center Hall, Pa.; Jacob K. Gise, of Beloit, Kas., and Mrs. Peter Klingler, of Manhattan, Ill.

In early life he joined the Lutheran Church, but in later years attended the church in which his wife held membership.

The funeral took place at his late home Wednesday, April 3d, at 2 o'clock, p. m., Rev. A. H. Morrison officiating.

Mr. Gise was a man of intelligence, force, and character, and a public spirited citizen, and will be missed in business as well as social circles. The first the writer knew of him was when he was a young man attending the Aaronsburg (Pa.) Academy as a student. He was a worker there, and continued so through life, accumulating considerable property and providing well for those dependent on him.

1977 (July)- Mabel Gise (Wife of Lloyd Preston Gise) dies in California

Full page : [HN00MN][GDrive]

Mrs R. T. Hall had as her guests for the week-end Mr. and Mr.s Larcy Hall of Eagle Pass and Mr. and Mr.s Lloyd Gise of Big Wells

Independent Press-Telegram (Long Beach, California) · 27 Feb 1977, Sun · Page 67

Graveside services Monday for Mabel Gise

Graveside services for Mabel Gise, member of a pioneer Texas family, will be held Monday, 11 a.m., at Westminster Memorial Park. Mrs. Gise died Thursday at the age of 89.

Her son, Ray Gise, retired I.P-T accountant, said Mrs. Gise and her family migrated to Texas from a French Huguenot colony in the Carolinas. Her father became a rancher.

She moved to Long Beach in 1936 and belonged to several state society groups, including the Emera Chapter 561, Order of Eastern Star.

She is survived by three sons, Ray, Seal Beach; Al, Corona; Reston, Cotulla, Tex.; a sister and brother in Texas, and grandchildren and great grandchildren.

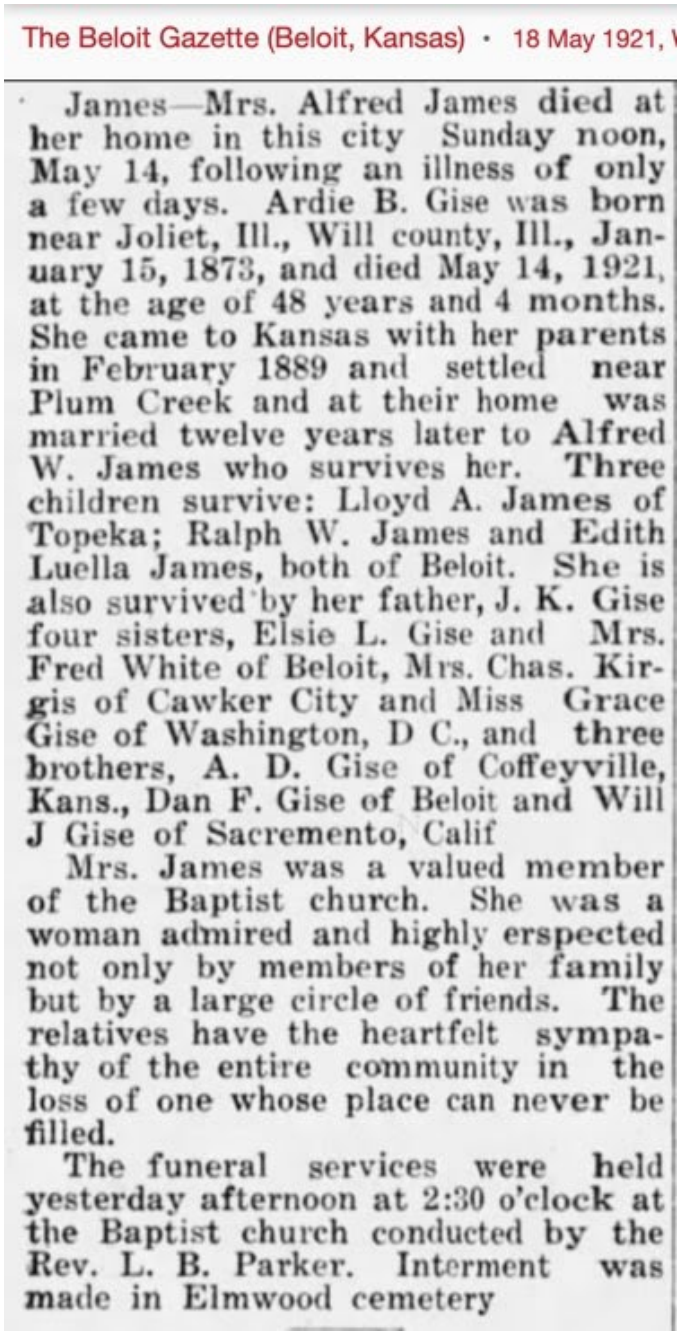
1921 - Travels from Washington DC to Beloit, KS for funeral of sister Ardie B (Gise) James

Full Page : [HN00CP][GDrive]



The Beloit Gazette (Beloit, Kansas) · 18 May 1921,

James—Mrs. Alfred James died at her home in this city Sunday noon, May 14, following an illness of only a few days. Ardie B. Gise was born near Joliet, Ill., Will county, Ill., January 15, 1873, and died May 14, 1921, at the age of 48 years and 4 months. She came to Kansas with her parents in February 1889 and settled near Plum Creek and at their home was married twelve years later to Alfred W. James who survives her. Three children survive: Lloyd A. James of Topeka; Ralph W. James and Edith Luella James, both of Beloit. She is also survived by her father, J. K. Gise four sisters, Elsie L. Gise and Mrs. Fred White of Beloit, Mrs. Chas. Kirgis of Cawker City and Miss Grace Gise of Washington, D C., and three brothers, A. D. Gise of Coffeyville, Kans., Dan F. Gise of Beloit and Will J Gise of Sacremento, Calif

Mrs. James was a valued member of the Baptist church. She was a woman admired and highly erspected not only by members of her family but by a large circle of friends. The relatives have the heartfelt sympathy of the entire community in the loss of one whose place can never be filled.

The funeral services were held yesterday afternoon at 2:30 o'clock at the Baptist church conducted by the Rev. L. B. Parker. Interment was made in Elmwood cemetery

Grover Gise Promoted

Grover Gise, who has been a Prudential Insurance Agent in this city for the past four years, has been promoted to assistant superintendent of the agency at Richmoad, having begun his duties there February 8. He and his family will move to that city in the near future. G. E. Shookman will succeed Mr. Gise as agent in this city.

Local Insurance Man Honored

Elmer M. Ryon, a representative of the Prudential Insurance company of this city, has been awarded an invitation to attend a meeting at West Baden on September 26 to 28, when the company will entertain the leaders of the western division, who lead in the production for the past 18 months. There will be about 2,000 leaders, including agents and executives from Indiana, Ohio and Kentucky. Grover Gise and C. L. Moore of Richmond and W. V. Brown of Connersville, former representatives in Rushville, have also been awarded invitations to attend the meeting. The conference is held every five years and is one of the largest insurance conferences held in this part of the country, it is stated.

The Indianapolis Star (Indianapolis, Indiana) • 23 Sep 1944,

Grover D. Gise Succumbs Here

GROVER D. GISE.

Grover D. Gise, 57 years old, former director of emergency housing in Center township and a bookkeeper at the Fidelity Trust Company until he became ill recently, died yesterday in his home, 116 South Bancroft avenue.

Born in Union county, near Connersville, Mr. Gise came to Indianapolis 14 years ago from Richmond. He was emergency housing director from 1938 to 1941. He was employed at the Fidelity Trust Company from 1942 until five months ago.

Active in Democratic politics, Mr. Gise was precinct committeeman of the Ninth precinct of the 14th ward. He was a member of the Downey Avenue Christian Church and the New Palestine Masonic Lodge.

Survivors include the widow, Mrs. Emma Ambrose Gise; four daughters, Miss Laura Bell Gise, Miss Louise Gise and Mrs. James Ricker, all of Indianapolis, and Ensign Ruth M. Gise of the Navy Nurses Corps; a son, Alan R. Gise of Indianapolis, and a brother L. R. Gise of Pampa, Tex.

Funeral services will be conducted at 1 o'clock Sunday afternoon in the Moore & Kirk Irvington mortuary and at 3:30 o'clock in the Lutheran Church in Lyonsville. Burial will be in Union cemetery in Lyonsville.

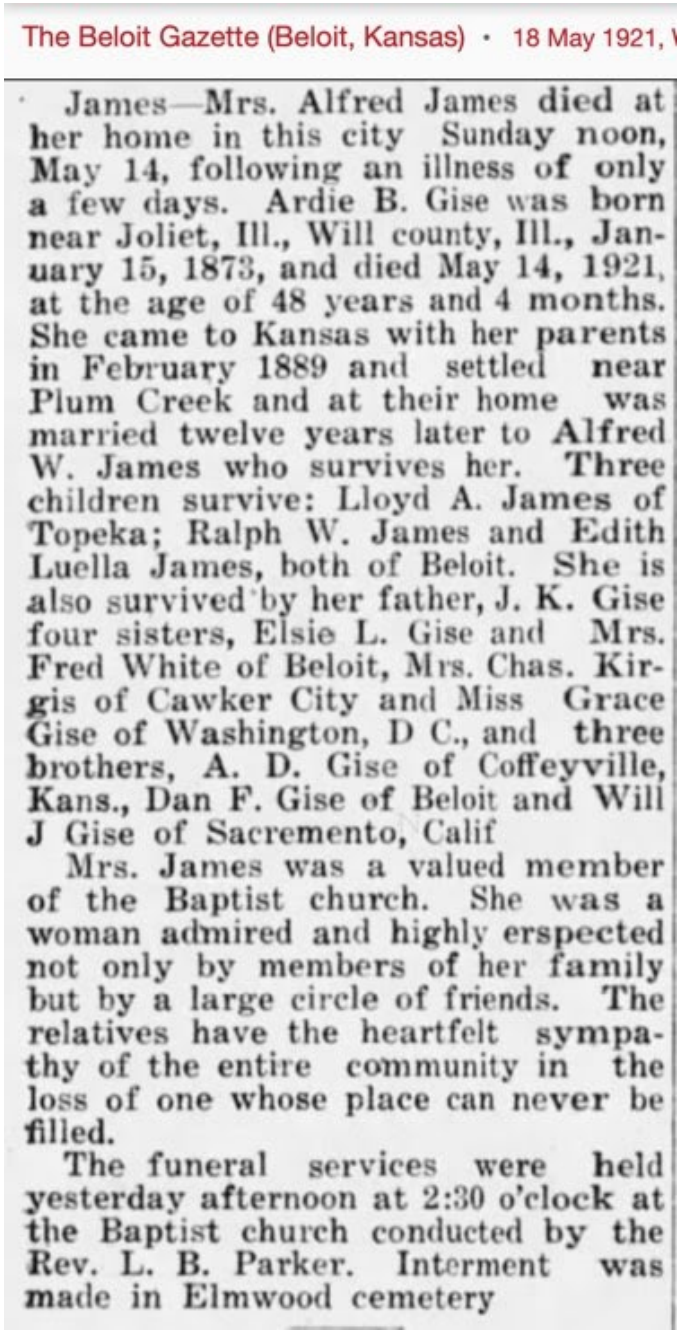
1921 - Sister Ardie B (Gise) James passes (William John Gise living in Sacramento at this time)

Full Page : [HN00CP][GDrive]



The Beloit Gazette (Beloit, Kansas) · 18 May 1921,

James—Mrs. Alfred James died at her home in this city Sunday noon, May 14, following an illness of only a few days. Ardie B. Gise was born near Joliet, Ill., Will county, Ill., January 15, 1873, and died May 14, 1921, at the age of 48 years and 4 months. She came to Kansas with her parents in February 1889 and settled near Plum Creek and at their home was married twelve years later to Alfred W. James who survives her. Three children survive: Lloyd A. James of Topeka; Ralph W. James and Edith Luella James, both of Beloit. She is also survived by her father, J. K. Gise four sisters, Elsie L. Gise and Mrs. Fred White of Beloit, Mrs. Chas. Kirgis of Cawker City and Miss Grace Gise of Washington, D C., and three brothers, A. D. Gise of Coffeyville, Kans., Dan F. Gise of Beloit and Will J Gise of Sacremento, Calif

Mrs. James was a valued member of the Baptist church. She was a woman admired and highly erspected not only by members of her family but by a large circle of friends. The relatives have the heartfelt sympathy of the entire community in the loss of one whose place can never be filled.

The funeral services were held yesterday afternoon at 2:30 o'clock at the Baptist church conducted by the Rev. L. B. Parker. Interment was made in Elmwood cemetery

Muncie Evening Press (Muncie, Indiana) · 30 Jul 1930,

MRS. CELIA GISE.

Mrs. Celia D. Gise, 65, widow of William C. Gise, died at the home of her sister, Mrs. Ralph Lyons, 218 East Adams St., Tuesday after an illness of several months. Funeral services will be conducted at 10:30 a. m. Friday from the Lyonsville Lutheran Church and burial will be in Union Cemetery.

Surviving are two sons, Grover D. Gise, of Indianapolis; Luther Gise, of Tulsa, Okla.; two brothers, Zed and Horace Layson of Connersville, and a sister, Mrs. Lyons. Friends may call at the Meeks Mortuary until Friday morning.

The Indianapolis Star (Indianapolis, Indiana) · 23 Sep 1944,

Grover D. Gise Succumbs Here

GROVER D. GISE.

Grover D. Gise, 57 years old, former director of emergency housing in Center township and a bookkeeper at the Fidelity Trust Company until he became ill recently, died yesterday in his home, 116 South Bancroft avenue.

Born in Union county, near Connersville, Mr. Gise came to Indianapolis 14 years ago from Richmond. He was emergency housing director from 1938 to 1941. He was employed at the Fidelity Trust Company from 1942 until five months ago.

Active in Democratic politics, Mr. Gise was precinct committeeman of the Ninth precinct of the 14th ward. He was a member of the Downey Avenue Christian Church and the New Palestine Masonic Lodge.

Survivors include the widow, Mrs. Emma Ambrose Gise; four daughters, Miss Laura Bell Gise, Miss Louise Gise and Mrs. James Ricker, all of Indianapolis, and Ensign Ruth M. Gise of the Navy Nurses Corps; a son, Alan R. Gise of Indianapolis, and a brother L. R. Gise of Pampa, Tex.

Funeral services will be conducted at 1 o'clock Sunday afternoon in the Moore & Kirk Irvington mortuary and at 3:30 o'clock in the Lutheran Church in Lyonsville. Burial will be in Union cemetery in Lyonsville.

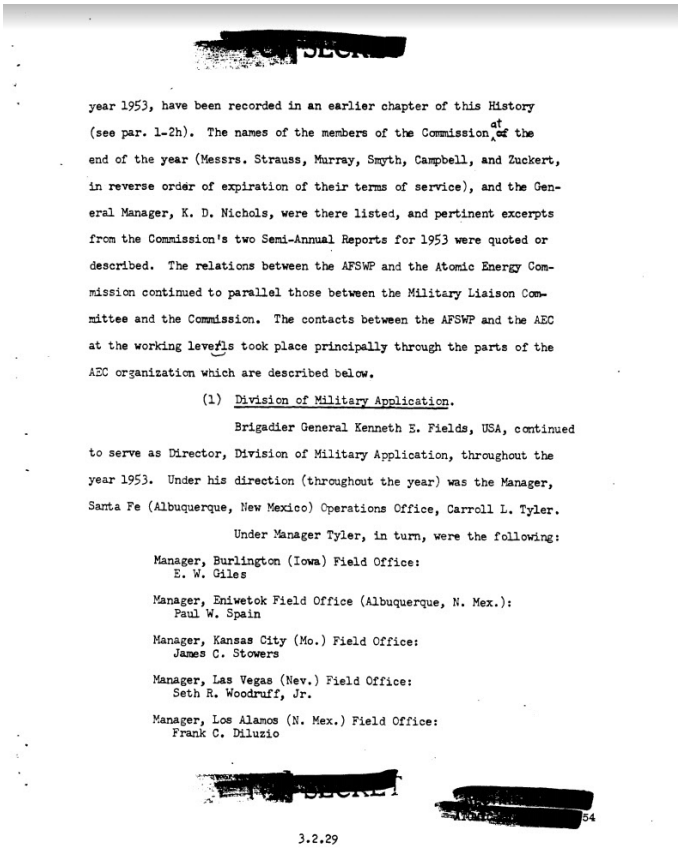
1953 - Deputy Chief, Plans and Programs Branch - Division of Military Application

PDF - "1994 Declassified First History of AFSWP 1947-1954 Vol 6 1953 Chapter 3" - [HG0030][GDrive]

His boss, "Captain F. L. Ashworth", is the guy who bombed Nagasaki - https://www.nytimes.com/2005/12/08/us/frederick-l-ashworth-93-atomic-bomb-handler-dies.html



year 1953, have been recorded in an earlier chapter of this History (see par. 1-2h). The names of the members of the Commission at the end of the year (Messrs. Strauss, Murray, Smyth, Campbell, and Zuckert, in reverse order of expiration of their terms of service), and the General Manager, K. D. Nichols, were there listed, and pertinent excerpts from the Commission's two Semi-Annual Reports for 1953 were quoted or described. The relations between the AFSWP and the Atomic Energy Commission continued to parallel those between the Military Liaison Committee and the Commission. The contacts between the AFSWP and the AEC at the working levels took place principally through the parts of the AEC organization which are described below.

(1) Division of Military Application.

Brigadier General Kenneth E. Fields, USA, continued to serve as Director, Division of Military Application, throughout the year 1953. Under his direction (throughout the year) was the Manager, Santa Fe (Albuquerque, New Mexico) Operations Office, Carroll L. Tyler.

Under Manager Tyler, in turn, were the following:

Manager, Burlington (Iowa) Field Office:
E. W. Giles

Manager, Eniwetok Field Office (Albuquerque, N. Mex.):
Paul W. Spain

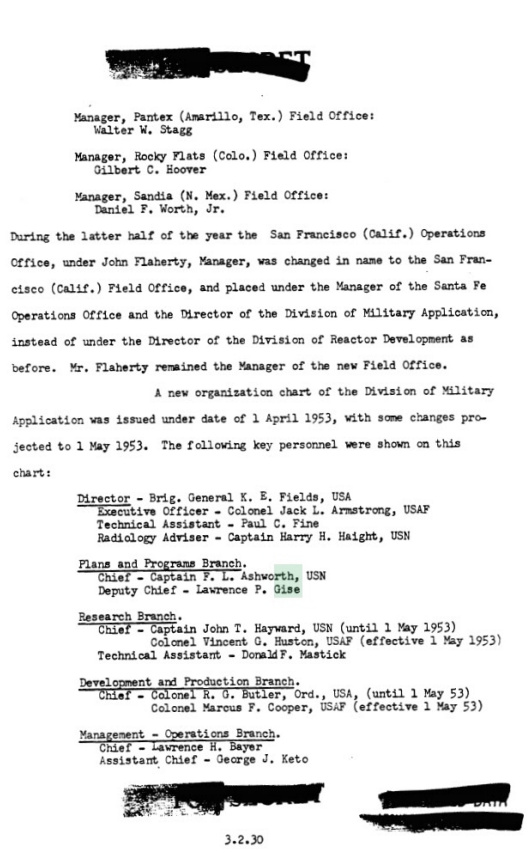
Manager, Kansas City (Mo.) Field Office:
James C. Stowers

Manager, Las Vegas (Nev.) Field Office:
Seth R. Woodruff, Jr.

Manager, Los Alamos (N. Mex.) Field Office:
Frank C. Diluzio

3.2.29

[HG0031][GDrive]



Manager, Pantex (Amarillo, Tex.) Field Office:
Walter W. Stagg

Manager, Rocky Flats (Colo.) Field Office:
Gilbert C. Hoover

Manager, Sandia (N. Mex.) Field Office:
Daniel F. Worth, Jr.

During the latter half of the year the San Francisco (Calif.) Operations Office, under John Flaherty, Manager, was changed in name to the San Francisco (Calif.) Field Office, and placed under the Manager of the Santa Fe Operations Office and the Director of the Division of Military Application, instead of under the Director of the Division of Reactor Development as before. Mr. Flaherty remained the Manager of the new Field Office.

A new organization chart of the Division of Military Application was issued under date of 1 April 1953, with some changes projected to 1 May 1953. The following key personnel were shown on this chart:

Director - Brig. General K. E. Fields, USA
Executive Officer - Colonel Jack L. Armstrong, USAF
Technical Assistant - Paul C. Fine
Radiology Adviser - Captain Harry H. Haight, USN

Plans and Programs Branch.
Chief - Captain F. L. Ashworth, USN
Deputy Chief - Lawrence P. Gise

Research Branch.
Chief - Captain John T. Hayward, USN (until 1 May 1953)
Colonel Vincent G. Huston, USAF (effective 1 May 1953)
Technical Assistant - Donald F. Mastick

Development and Production Branch.
Chief - Colonel R. G. Butler, Ord., USA, (until 1 May 53)
Colonel Marcus F. Cooper, USAF (effective 1 May 53)

Management - Operations Branch.
Chief - Lawrence H. Bayer
Assistant Chief - George J. Keto

3.2.30

Preston Gise Gets A. E. C. Award

Lawrence P. Gise, formerly of Big Wells, was presented an Outstanding Service Award by the U. S. Atomic Energy Commission at its annual Honor Awards Ceremony in Washington, D. C., Nov. 14.

Mr. Gise, known to his Dimmit County friends as Preston Gise, is a 1933 graduate of Big Wells High School. He is a nephew of the late Robert T. Hall and is a son-in-law of Mr. and Mrs. Yancy C. Strait of Big Wells. His wife is the former Miss Mattie Louise Strait.

The citation accompanying the award states: "Mr. Lawrence F. Gise has served in progressively more responsible positions in the Division of Military Application (of the A.E.C.) for the past six years. He led a successful effort to attain coordination and integration of Department of Defense Weapon requirements with the production, research, and development capabilities of the Atomic Energy Commission. He also carried ably the responsibility for budget and financial management during crucial years of operational growth in the weapons program characterized by frequent and radical changes in scope and direction.

In these tasks and as Assistant Director of the Division of Military tasks of complexity and difficulty. The results of the work he has guided have significantly contributed to the national defense and security."

Mr and Mrs. Gise left Big Wells in 1935 soon after they were married for Washington, D. C., where Mr. Gise entered government service. They have a son, Preston Jr., 20, and a daughter, Jacklyn Marie, 10.

Pentagon Picks Space Deputy

WASHINGTON, March 5 (AP)—The Pentagon's new space agency today got its deputy director, Rear Admiral John E. Clark, who has been serving as director of the Navy's guided missiles division.

The appointment was announced by Roy W. Johnson, who was named director at the Advanced Research Projects Agency on Feb. 7.

Johnson also named a director of program control and administration for the space agency. He is Lawrence P. Gise, former assistant director of the division of military applications of the Atomic Energy Commission.

Johnson chose as his special assistant Lambert L. Lind, an executive of Ebasco Services, New York, a large industrial construction firm. Lind will take over his duties at the Pentagon on March 21.

Johnson is still looking for a top level scientist to be his principal assistant in the unified effort to research, develop and perfect new military weapons and concepts relating to the newly explored field of outer space.

Augusta County's Deer, Turkey Kills Set Records

Deer Total, 1,515; Last Year, 1,188; Turkeys an Elusive 85

Final tabulations of the results of last week's open deer season in Augusta County discloses a record deer and turkey kill for 1958.

According to information furnished by State Game Wardens W. D. Wade and Houston I. (Jack) Todd, 1,489 deer and 85 turkeys fell before hunters' guns in Augusta last week—setting a new record for the week-long season. The 1,489 total during gun season coupled with the 26 total for the county during bow and arrow season brings the total deer kill for 1958 to 1,515 — quite an increase over the 1957 record kill, which totaled 1,188.

Both the eastern and western sectors of Augusta showed an increase. A total of 333 deer were killed in eastern Augusta during the week — 97 more than last year. Western Augusta recorded 1,182 kills.

Both sides of the county showed marked increase in the number of turkeys killed.

Bear Season Begins

Today, dozens of hunters were reported in the mountains of the county as bear became legal game.

Willard's Esso Service Station at West Augusta was again the leading game checking station for Augusta County with a total of 298 deer and nine turkeys checked in. The Community Center at Sherando was the leading checking station in eastern Augusta with a total of 145 deer and ten turkeys checked during the week-long season.

A rundown of the week's kill by checking stations:

Western Augusta

Willard's Esso Station, West Augusta, 298 deer, nine turkeys; Hoy's Store, Deerfield, 175 deer, seven turkeys; Snook's Store, Mt. Solon, 171 deer, eight turkeys; Somerville's Store (Hamilton's), C. I. Vaughn, Waynesboro, 7 points; Esther M. Coleman, Waynesboro, 3 points; C. G. Haney, Charlottesville; Chas. D. Pirkey, Rt. 1, Waynesboro, 5 points; A. C. Chalkley, Waynesboro, 5 points; Roger E. Helmuth, Fishersville, spike; Nelson Hanger, Waynesboro, spike; Alton N. Lewis, Stuarts Draft, 6 points; Elmer Lee Fix, Stuarts Draft, spike; Philip O. Brooks, Waynesboro, 3 points; Charles B. Johnson, Waynesboro, 4 points; Calvin Loving, Bybee, Va., 3 points; Tommy Vance, Waynesboro, spike; M. H. Baylor, Waynesboro, spike; Clyde H. Spears, Waynesboro, 3 points; Veldon J. Fleming, Lyndhurst, 10 points; William O. Warren, Alexandria, spike; Elwood Doffenbaugh, Fishersville, buck; Haywood Wheeler, Amherst, spike; A. O. Walker, Waynesboro, spike; Bobby Joe Level, Waynesboro, buck; J. H. Kirtley, Greenwood, 7 points; Ruth N. Bauserman, Arlington, spike; 7. R. Mays, Stuarts Draft, spike; Marshall W. Chittum, Fishersville, 8 points; James E. Brooks, Waynesboro, spike; B. G. Fitzgerald, Stuarts Draft, 5 points; Linwood A. Rhodes, Annandale, 7 points; Bobby Wayne Henderson, Lyndhurst, 8 points; Claude J. Keith, Danville, spike, 83 bucks.

Sixty-two doe by the following: William Templeton, Lyndhurst; Cleveland Thacker Jr., Roseland; Larry Wade, Waynesboro; P. J. McGuire, Phoebus; Berkley H. Shelton, Hurt; William J. Abbott Jr., Amherst; J. M. McGrath, Waynesboro; Samuel Mack Day, Waynesboro; Edgar E. Senter, Madison Heights; Mel Hudson, Waynesboro; J. L. Broughman, Waynesboro; Mary D. Workman, Waynesboro; Stuart Walker, Gordonsville; Henry Stahly Redard, Staunton; Nelson T. Offutt Jr., Charlottesville; Laurence P. Gise, Arlington; Ralph H. Groah, Lyndhurst; Wilson Clay Hewitt, Waynesboro; Edgar H. Johnson Jr., Silver Spring, Md.

O. M. Wheeler, Lyndhurst; Clarence W. Cary, Waynesboro; Daniel W. Kanagy, Stuarts Draft; John S. Beiler, Stuarts Draft; R. M. Hodge, Roanoke; Leo L. Moses, Waynesboro; Stephen N Gill, Hunt, Va.; Tommy Fix, Stuarts Draft; Roger Lee Fitzgerald, Stuarts Draft; Robert L. Taylor, Waynesboro.

Tony Raines, Waynesboro; Roy Allen Fox, Waynesboro; Gerald E. Wilson, Waynesboro; Ray A. Pangle, Waynesboro; F. C. Armentrout, Waynesboro; Lavelle A. Lunsford, Lyndhurst; Wayne Maddox, Madison Heights.

Melvin Carpenter, Waynesboro; Ballard F. Wade, Waynesboro; Glenn Hahn, Waynesboro; Carl L. Drumheller, Ft. Defiance; Carl G. Alexander, Waynesboro; Lewis D. Bowyer, Altavista; Donald Lawhorn, Waynesboro; James D. Drumheller, Staunton.

Ten turkeys by the following: Millard G. Lawhorn, Waynesboro; S. V. Yearwood, Newport News; Jack Baylor, Waynesboro; J. Douglas Fisher, Waynesboro; Chester R. Fitzgerald, Stuarts Draft; Clyde W. Dowdy, Waynesboro; Harry W. Brower, Waynesboro; David Bryant, Lynchburg; Harley Anderson Tomey, Waynesboro; Roy C. Campbell, Lyndhurst.

points; David E. Harshbarger, Stuarts Draft, 7 points; Ralph Dixon, Stuarts Draft, spike; Agnes R. Thacker, Stuarts Draft, spike; Theodore Davis, Rt. 2, Waynesboro, 5 points; Dr. Geo. L. Chamberlain, Richmond, spike.

James M. Fisher, Waynesboro, spike; Samuel Kanagy, spike; Curtis E. Via, Crozet, 8 points; W. M. Fitzgerald, Ivy, 8 points; Adger L. Cooley, Alexandria, 3 points; Lambert I. Irby, Alexandria, 5 points; Lawrence Nuckoles, Greenville, 6 points.

Russell W. Allen, Stuarts Draft, 8 points; John Kislek, Waynesboro, spike; C. C. Lawhorn, Waynesboro, 6 points; Glenn B. Griffin, Stuarts Draft, 6 points; William L. Willson, Staunton, 9 points; William W. Leavell, Waynesboro, Rt. 2, 4 points; Calvin Damerson, Stuarts Draft, 6 points; David L. Campbell, Stuarts Draft, 4 points, for a total of 34 bucks.

Twenty-one doe by the following:

Robert L. Harris, Stuarts Draft Ronald W. Coiner, Staunton; Tommy VanFossen, Stuarts Draft; Willie Allen, Stuarts Draft; G. Fred Kinzer, Culpeper; David Ingram, Rixeyville; Frances S. Trefts, Charlottesville; Richard Mason, Natural Bridge.

H. H. Brown, Waynesboro; Russell W. Flotz, Waynesboro; Calvin Beverley, Stuarts Draft; John Newman, Kenton, Ohio; Eugene Madison, Waynesboro; Wayne Schrock, Stuarts Draft; Wesley J. Mann, Arlington; Davis Gamvis, Crozet; George Mitan, Akron, Ohio; Willie E. Griffin, Stuarts Draft; Melton Bradley, Stuarts Draft; Alfred L. Chittum, Staunton; Jas. H. Batten Jr., Ivy.

Four turkeys by the following: Dorsey Almarode, Waynesboro; R. Lloyd Campbell, Roseland; Wayne Schrock, Stuarts Draft; Joseph E. Aronoff, Forbes.

West Augusta, 147 deer, no turkeys; Armstrong Hardware, Churchville, 146 deer, eight turkeys; Burns' Store, Buffalo Gap, 72 deer, twelve turkeys; Kincaid's Store, Goshen, 54 deer, three turkeys; Tommy Smith's Service Station, Craigsville, 50 deer, eight turkeys; Strange's Store, Augusta Springs, 25 deer, three turkeys; Rosen's Store, Middlebrook, 22 deer, eleven turkeys; Wade's Store, Fordwick, six deer, no turkeys. Total deer, 1166. Total turkeys, 69.

Eastern Augusta

The Community Center, Sherando, 145 deer, ten turkeys; Eavers Supply, Stuarts Draft, 55 deer, four turkeys; Estes Store, Crimora, 50 deer, no turkeys; Dooms Store, Dooms, seven deer, one turkey; Verona Hardware, Verona, nine deer, no turkeys; Harris Service Station, Steeles Tavern, twelve deer, no turkeys; The Country Store, Lyndhurst, 23 deer, no turkeys; Supple Hardware, Greenville, 22 deer, one turkey. Total 333 deer, 16 turkeys.

A complete listing of the lucky hunters who brought home game during the past week, furnished by Warden Wade in western Augusta and Warden Todd in eastern Augusta:

In eastern Augusta, the report by checking stations show:

Sherando

J. Edw. Wilson, Ridgeway, spike; Frank Barnett, Crozet, 8 points; Paul H. Johnstone, Fairfax, spike; G. N. Patterson, Madison Heights, 4 points; W. F. Thornton, Stuarts Draft, 3 points; Darrell Drumheller, Lovingston, spike; Donald B. Snyder, Waynesboro, spike; Boyd Batman, Lyndhurst, 4 points; Delmer D. Pugh, Waynesboro, spike; Arnold Norvell, North Garden, spike; Billy Balsley, Waynesboro, 5 points; Robert T. Evans, Waynesboro, spike; Freddie Zeh, Waynesboro, 8 points; Corbin Dixon, Waynesboro, spike; Major Lee Graybill, Troutville, 5 points; D. W. Smallwood, Roanoke, buck; Paul D. Painter, Waynesboro, 3 points.

Frank M. Graybill, North Garden, spike; James O. Smith, Roanoke, 4 points; E. L. Carwile, Norfolk, 5 points; Michael Lilley, Waynesboro, buck; James H. Patterson, Lyndhurst, buck; Ronald E. Hunt, Lyndhurst, 2 points;; James W. Butter, Faber, buck.

Crouch, Arlington, 4 points; Rudolph C. Omber, Arlington, 10 points; David C. Yoder, Staunton, Rt. 2, 7 points; W. R. Allen, Stuarts Draft, 8 points; Shirley Massie, Staunton, spike; Harold D. Allen, Stuarts Draft, 4 points; Harry Waybright, 12 N. Madison St., Staunton, spike.

William J. Forrer, Staunton, spike; Marvin G. Humphries, Stuarts Draft, 6 points; James DeMastus, Stuarts Draft, 9 points; W. B. Wonderley, Grottoes, 10 points; John Benny Cook, Rt. 1, Staunton, spike; Michael Howard Cook, Rt. 3, Staunton, spike; Floyd Carter, Rt. 1, Waynesboro, spike; Gary Hostetter, Crimora, 7 points; Gay Scrogham, Crimora, 4 points.

C. D. Andes, Grottoes, spike; Clinton D. Brown, Waynesboro, spike; Douglas R. Brown, Waynesboro, Rt. 1, spike; L. M. Boserman, Grottoes, 5 points; Gene W. Childress, Waynesboro, 8 points; Maxie Coffey, Waynesboro, 8 points; Harry J. Johnson

(See RECORD DEER, Page 6)

All That Remains

AFTERMATH of the deer hunting season is shown here at the Blue Ridge Storage Company where more than 160 deer carcasses are being kept for lucky hunters. The deer are being stored until they are butchered. (Staff Photo by Topping)

Youngsters Do The Honors

LOUISVILLE, Ky. (AP)—It was a different kind of ground breaking at the new $47,000 education building of Newburg Christian Church.

The rite was performed by children.

Instead of shovels, they used spoons.

Adults decided that since the children eventually will use the structure, they should be the ones dedicating it.

Missing Portraits Returned to Museum

AIX EN PROVENCE, France (AP)—Two missing portraits by Van Dyck showed up neatly wrapped at the Beaux Arts Museum today with a little note saying they had been taken to win a bet.

The two postcard-size old masters, worth $14,000, disappeared Saturday. They were of Dutch painters Van Diepnbeeck and Rickaert. The janitor of the museum found them on the outside ledge of one of the building's windows.

Forest Fire Fought At North River

U. S. Forest Service firefighting crews are still battling a 40-acre forest fire in the North River Dam area of the George Washington National Forest near what is known as Skidmore Branch.

The fire, of undetermined cause, was first detected by the Reddish Knob lookout tower about one p m. Saturday. Three warden crews and hunters whose help was enlisted, a total of 36 men, brought the fire under control at four p. m. Saturday, but it flared up again Sunday night and although it is now under control, 25 men under the leadership of Wilbur Eavers and A. W. Clinedinst, chief wardens, still were on the scene this morning.

According to Glenn Harmon, forestry aid, who mans the Reddish Knob lookout tower, the fire has burned over about 40 acres of woodland.

Other Blazes

Three other fires were reported in forested areas of Augusta and Highland Counties during hunting season.

Last Monday, quick action averted the spread of a small fire near Deerfield, R. L. Rowland, ranger, Deerfield District, reports. The fire was believed started by a careless hunter.

Two other similar fires were reported Friday in Highland. A stump fire Friday night was extinguished by one Forest Service man on Shaw's Ridge in the Headwaters section.

About five one-hundreds of an acre of woods was burned over Friday night in Salt House Hollow also near Headwaters, Mr. Rowland said. That fire was believed to have been started by a hunter who emptied his pipe on a dead log.

"We are thankful that none of the fires was more serious and also for the help of hunters who helped in putting out the fires," Mr Rowland said.

Five Day Weather

RICHMOND (AP)—Extended five-day forecast for Virginia, Tuesday through Saturday, Nov. 25-29: Temperatures will average two to five degrees below normal, colder Tuesday and Wednesday, somewhat warmer Thursday, then colder Friday and Saturday. Rain late Wednesday or Thursday and again about Saturday with snow flurries in mountains.

Board To Be Introduced in Moonlit Taj Mahal Setting

Club Debs Will 'Bow'

Mrs. George Dennis, new president of the Sanado Woman's Club, and her executive board will be introduced at a formal ball Saturday night in the Coronado Club, Sandia Base.

Lawrence P. Gise, deputy manager, Albuquerque Operations, Atomic Energy Commission, is to present Mrs. Dennis and Mrs. O. B. Tjeltweed, first vice president; Mrs. H. A. Romme, second vice president; Mrs. R. W. Mottern, third vice president; Mrs. D. H. Hosterman, fourth vice president; Mrs. F. C. Cheston, fifth vice president; Mrs. R. G. Luckey, secretary, and Mrs. H. C. Olson, treasurer.

Mrs. Dennis was formerly first vice president and program chairman. She also was the 1961-62 winner of the Matrix award for her work as publicity chairman.

Mrs. Tjeltweed is active in the Sanado art group and has charge of the Art Show being presented at Winrock during the Science Fair.

A native of New Mexico, Mrs. Romme was chosen Mrs. Sanado of 1962 at the club's spring fashion show. Mrs. Mottern has been active in the club since its beginning. Before moving to Albuquerque, she worked in the laboratory at Oak Ridge, Tenn.

Mrs. Hosterman, an accomplished horsewoman, has been chairman of the horseback riding interest group the past year. Since moving here last July, Mrs. Cheston has been an active Sanado Club member and has affiliated with several other local groups.

During 1959-60 Mrs. Luckey was treasurer of the investment interest group. This year she is a member of the bridge group. Mrs. Olson, a charter member, is active in the bowling and golf groups.

The decor for the ball will be keyed to the theme of the Taj Mahal by moonlight. Entering the lobby, guests will find themselves on a path leading to the Taj Mahal, painted on a large mirror at the end of the walk. A profusion of green shrubs with brightly colored birds perched on the branches will edge the walk and pool. Mrs. N. L. Vinson is painting the Taj Mahal.

A gold swag, large hanging brass fixtures and a scroll-trimmed candle will grace the stage in the ballroom. The walls will be draped in blue gauze, through which will be seen a golden skyline of mosques and minarets against twinkling blue lights. A mass of shiny stars will accent the deep blue ceiling.

As a dramatic touch, the large fireplace, featuring Persian drapes at the top, will have a jewel-studded gold mantel. In the opening of the fireplace, against a background of jungle greens, will be a jeweled elephant.

Mrs. E. R. Frye is chairman of decorations and is being assisted by club members.

In addition to introducing the new officers, this year's ball will inaugurate the presentation of 11 young women, daughters of Sanado Club members, who will make their formal bows to society.

S. P. Schwartz, president of Sandia Corp., will introduce the Sanado Debs, Misses Anne Elizabeth Viney, June Lois Smith, Mary Sue Herrity, Nancy Elizabeth Baker, Karen Louise Fesler, Margie Katherine Carroll, Susan Loueise Lannon, Sherry Lynn Young, Nancy Jane Carpenter, Barbara Alice Lamkin and Pamela Jane Hepplewhite.

Greeting guests at the door will be Mr. and Mrs. James E. Baylor and Mr. and Mrs. K. Dan Hardin. Receiving in the ballroom will be Mr. and Mrs. Charles O'Keefe, Mr. and Mrs. R. H. Schultz and Mr. and Mrs. James B. Ayers. Other retiring board members will be hosts and hostesses.

The cocktail hour is set for 6-7 p.m., with dinner and dancing following. The Lads of Note are to play. Reservations must be made at the Coronado Club by Wednesday.

FOLLOWING THE PATH to the Taj Mahal, the decorative theme for the Sanado Club ball, will be, Mrs. H. C. Olson, seated, treasurer; standing, left to right, Mrs. R. W. Mottern, third vice president, and Mrs. Howard A. Rommo, second vice president. Mrs. Olson is to wear a blue cocktail dress, an all-over eyelet embroidery bodice topping a full chiffon skirt. Her accents will be in pink. Mrs. Mottern's selection for the event is a gown with black lace top and white satin skirt. Mrs. Romme will be wearing a cocktail length frock of yellow with lace bodice and flowing chiffon skirt.

ABOVE: Top officials of Sanado Woman's Club, who will be introduced at the formal ball Saturday night, are Mrs. O. B. Tjeltweed, seated, vice president, and Mrs. George Dennis, standing, president. In the back, left and right, are their husbands, O. B. Tjeltweed and George Dennis. For the occasion, Mrs. Dennis will wear a regal floor-length dinner gown of white silk matte jersey, designed with a flowing panel on the Empire body. Crystal chandelier earrings and evening length kid gloves complete her costume. Mrs. Tjeltweed is wearing a floral gown in shades of pink, styled with a draped bodice and full skirt. For accent, she'll use rhinestone accessories. The annual club event, to be held at the Coronado Club, Sandia Base, will open with a cocktail hour from 6-7, dinner and dancing following.

BELOW: Honorees at the Sanado Club ball also will include, left to right, Mrs. D. J. Hosterman, fourth vice president; Mrs. F. C. Cheston, fifth vice president; Mrs. Terry M. Cowles, retiring president, and Mrs. R. G. Luckey, secretary. Mrs. Hosterman will be wearing a cocktail length dress of white nylon tulle over satin, fashioned with a scoop neckline and full skirt trimmed with appliqued lace. Mrs. Cheston has selected a gray ball gown with an all-over floral print in black for the dinner-dance. Mrs. Cowles' floor-length gown of red satin, trimmed with rhinestones, has a fitted bodice and bouffant skirt. With it she wears rhinestone jewelry and evening length gloves. Mrs. R. G. Luckey will be seen in a pink chiffon dress, complemented with pink jewels and short white gloves. Music for dancing is to be played by the Lads of Note.

(Journal photos by Del Sanchez)

People, Parties

Country Club Lists May Social Events

Mrs. J. L. Hendren and Mrs. Bernard Spivey will be hostesses for a Ladies Day luncheon May 15 at Albuquerque Country Club.

Luncheon will be served at 1230 p.m., and will be followed by a travelogue. Mrs. T. R. Sadock will speak and show slides of Iron Curtain countries she and her husband visited on an extended tour. Many of the slides were taken on the spot, while others are reproduced from her paintings of areas where photography was not permitted. Luncheon reservations for members and their guests are limited to 200.

Informal dinner dances are planned for three Saturday nights in May. The Tommy Morgan Trio will play for dancing Saturday night from 8:30-midnight; Bud Fisher's Orchestra will play May 11 for dinner dancing; and May 25 the Cosmo Combo Orchestra will play for the informal dinner-dance.

The pool will be opened for members May 30 at the Albuquerque Country Club. Hours are from 10:30 a.m.-6 p.m. Davey Barney is the new aquatic coach for the club, and the new summer teaching golf professional is Terry Langohr.

Mrs. Caroline O. Hawn is announced as a new junior member of the Country Club this month.

Mrs. Jethro S. Vaught is chairman of the Friday play of the Woman's Golf Assn. during May, and Mrs. W. E. Dennard is chairman of the President's Tournament.

Qualifying rounds of the tournament will be played May 10, handicap match play; followed by tournament play May 14, 15, 16. Trophies will be presented at a luncheon meeting of the Women's Golf Assn. at 1 p.m. May 24. There will be no play May 30, Memorial Day.

Mother's Day luncheon will be served from noon-2:30 p.m., dinner service from 5:30-8 p.m. Reservations are asked.

Mr., Mrs. Livingston On Vacation Cruise

Mr. and Mrs. Howard E. Livingston, 1518 Los Arboles NW, are leaving this week for a cruise of islands in the South Pacific, New Zealand and Australia.

The Livingstons will board the SS Monterey Thursday, leaving from San Francisco, by way of Los Angeles, and on to major ports of call in the South Pacific.

Dr. Kirtley Mather Visits Daughter Here

Dr. Kirtley Mather, geology professor emeritus of Harvard University, will arrive today for a weekend visit in the home of his daughter and son - in - law, Prof. and Mrs. Sherman Wengerd, 1044 Stanford NE.

Dr. Mather is in Albuquerque to speak on "The Earth Sciences in the 60's" at 8:30 Monday night in the anthropology building on the University of New Mexico campus. His talk is a John Wesley Powell Memorial lecture, given for the 39th annual meeting of the National Assn. for the Advancement of Science.

Prof. Wengerd will have his father-in-law as a special guest for a dinner meeting of the "21 Club" Monday night prior to the lecture. Dr. Mather's grandson, Tim Wengerd, choreographed two of the numbers for the performance of the University Dance Workshop concert tonight, when Dr. Mather will attend with Prof. and Mrs. Wengerd.

'Polaris' Officer and Family Visit His Mother Here

Lt. and Mrs. Herbert P. Woods and two children left Friday after a visit in Albuquerque with his mother, Mrs. Wanda M. Woods, 2712 San Pablo NE. They also visited with his brother and family, Mr. and Mrs. James Woods; a sister and brother-in-law, Mr. and Mrs. Richard Gosso; and a niece, Mrs. Karen Lewis.

Lt. Woods, formerly of the U. S submarine "Polaris," is en route to Glen Cove, N. Y., where he has a three year appointment for post graduate work in naval construction and engineering at Webb Institute of Naval Architecture.

Lt. Woods was raised in Albuquerque, was graduated from Albuquerque High School and attended the University of New Mexico. He was graduated with the class of 1956 from the United States Naval Academy at Annapolis.

Miss Anderson to Direct Chorus in 'Spring Sing

Miss Nancy Anderson, daughter of Mr. and Mrs. Theodore B. Anderson, 5926 Second NW, has been elected treasurer of Sigma Alpha Iota, national music honorary, at Oklahoma College for Women, Chickasha, Okla.

She will be director of the Nellie Sparks Hall Chorus, competing in the annual Oklahoma College for Women's "Spring Sing," today in the OCW auditorium. The sing is a feature of parents day, and will be followed by a punch party in the Student Union.

Among her other music activities, Miss Anderson will play a piano duet with Miss Patricia Gambel of Amarillo as a feature of the program for a recital to be presented Tuesday by the OCW fine arts department in recital hall of the fine arts building. She will also be piano accompanist for the junior voice recital of Miss Marilyn Lacy Douglas of Minco, Okla., Tuesday night at OCW.

Miss Anderson and her sister, Mary, have been elected song leader and vice president, respectively, of Be Si Ta social club at OCW. The club entertained at a tea Saturday in the reading room of Nash Library on the college campus, honoring returning members for alumnae and former students day.

Mr. and Mrs. Schaab Return from New York

Mr. and Mrs. William C. Schaab, 6436 Rio Grande NW,

Continued on B-8

Ralph Berkowitz Guest Pianist

From the Journal's Santa Fe Bureau

SANTA FE — Eighty performers will be on the stage of St. Francis Auditorium tonight to present Beethoven's "Fantasie for Orchestra, Chorus and Solo-Piano."

The work will be performed by the Santa Fe Symphony, Ralph Berkowitz of Albuquerque, pianist, and the Bel Canto Singers of Albuquerque, directed by Norman Russell Bell.

The symphony, conducted by Bernard Rubenstein, also will play Mozart's "Seraglio" overture and Beethoven's "Eighth Symphony in F Major." The concert will begin at 8:30.

A new translation of the old German version of Teethoven's "Fantasie" was commissioned especially for the concert. It was prepared by two Santa Feans, Winfield Scott, the poet, and Dr. Richard Landman.

Three Are Killed In Mine Explosion

WELCH, W.Va. (AP) — Three men were killed in a southern West Virginia coal mine Monday, apparently by a gas explosion.

They were working in the Island Creek Coal Co.'s No. 6 mine, about 25 miles southwest of Welch.

The three, Pete Hagerman, 38, Harry Hillyer, 48, and Nash Riffe, 53. They had been assigned on an overnight shift to recover some track in an idle section of the mine.

AWARD — Lawrence P. Gise (left), manager of AEC's Albuquerque Operations Office, presents a certificate of appreciation to the employes of the Los Alamos area office for their achievements in economy and efficiency of operations during the period of December 1963 through November 1964. Charles C. Campbell (right), manager of the Area Office, accepts the award on behalf of LAAO employes.

Agreement Reached

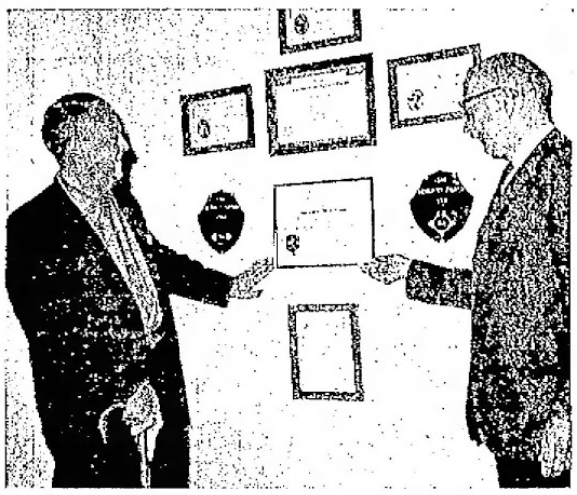
LOS ALAMOS — An employe-management agreement has been signed between representatives of the Atomic Energy Commission and the Inspectors Unit of the Protective Force, Charles C. Campbell, AEC area manager, announced Tuesday.

The agreement was negotiated by the Los Alamos area office and the Inspector's Unit and implements an executive order issued by President Kennedy January 17, 1962.

Members of the AEC negotiating team were Edwin A. Eisenhart, chairman, Leonard F. O'Connor, Eugene Pride and Thomas Roche. Representing the Inspector's Unit were Theodore A. Weisgerber, Jr., chairman, Bernard Belsheim, Jack Donahye, Allen Herring, Fred Selarge and Paul Robyn.

Signing the agreement for the AEC were Charles C. Campbell, area manager, and Edwin A. Eisenhart, chief of the Security Branch. Signing the agreement for the Inspector's Unit were Theodore A. Weisgerber, Jr., president, and Paul Robyn, vice president.

The Agreement was also signed by John F. Griner, national president, AFGE, and Lawrence P. Gise, AEC Manager of the Albuquerque Operations Office.



EMPLOYER OF YEAR — Zia Company Manager at Los Alamos, Wendell L. Miller, right, and personnel director H. Clifford Goodson add the Employer's Merit Award to the company's collection. Zia was named as the state's Employer of the Year.

Zia Company Employer Of The Year

LOS ALAMOS — Employer of the Year selected by the New Mexico Governor's Committee on Employment of the Handicapped is The Zia Company which has received the Employer's Merit Award from the President's Committee.

Presentation of the award was made by Committee Chairman Richard W. Helm of Albuquerque to H. Clifford Goodson, Zia personnel director, at the annual fall meeting of the committee at Clovis.

The Merit Award was presented to Zia for "exceptional accomplishments in extending more opportunities through selective placement in useful employment of handicapped employes, and assisting in every feasible way to acquaint the public and employes with these principles."

In other actions at the Clovis meeting, Goodson, a longtime member of the Governor's Committee, was elected vice-president. H. J. Hebbeln, supervisor of the State Department of Public Welfare Division of Services for the Blind, was elected chairman. Paul T. Davidson, Employment Security Commission, Albuquerque, was re-elected executive secretary.

AEC May Scrap Reactor

BY THE ASSOCIATED PRESS

WASHINGTON — The Atomic Energy Commission may scrap its plan to build a $348-million atom smasher.

A source outside the commission said Thursday that three alternative proposals are under consideration.

He said each would be cheaper, and each would be for a machine of lesser intensity than the proposed 200-billion electron volt (BEV) accelerator which would be used for basic research.

Some 85 communities in 43 states have been scrambling to win the project for their area.

Rep. Craig Hosmer, R-Calif., a member of the joint Senate House Atomic Committee, was told of the report.

"To me, it looks like possibly the beginning of the end for the 200-BEV, $348-million machine," he said. "When you start talking about alternatives it adds up to that."

"To me, it looks like possibly the beginning of the end for the 200-BEV, $348-million machine," he said. "When you start talking about alternatives it adds up to that."

The source said the AEC has scheduled a late January meeting to get the views of some of the nation's leading high-energy physicists.

He described the alternatives as:

— A suggestion by Prof. S. Devons, chairman of Columbia University's Department of Physics, that the AEC's existing 33-billion electron volt atom smashers at Brookhaven National Laboratory, Long Island, N.Y., be scaled up to the 120-150 BEV range. This could cost about $150 million.

—A suggestion from the Lawrence Radiation Laboratory of the University of California that the existing 200 BEV plan be scaled down to a lower intensity. This would cost about $260 million.

—A suggestion by Prof. R. R. Wilson of Cornell that a $150-million machine of lower intensity be built with provisions to increase its intensity over a period of years.

Selection of either of the latter two proposals still would require the AEC to choose a site.

Prospects Aired at Meeting

Optimism Keynotes ACF Plant Talks

By W. WILSON CLIFF

Optimism prevailed Thursday as high officials of two federal agencies met with Albuquerque's civic and governmental leaders to consider the future role of the Atomic Energy Commission's South Albuquerque Works, now being operated under AEC contract by ACF Industries, Inc.

Yet officials of the AEC and the General Services Administration (GSA) acknowledged a conscious effort to avoid generating an unfounded optimism which would lead present employes of ACF Industries to make disadvantageous economic decisions.

"The best we can do is give an honest appraisal of the situation," said Wilfred E. Johnson, member of the Atomic Energy Commission, who conducted the informal discussion with leaders of city, county and state governments and Albuquerque's

able us to meet our responsibilities."

These qustions also were asked:

—What if you don't get a bid in June?

— Suppose the high bidder should plan to dismantle the plant and move the equipment elsewhere? Would you sell it to him?

—What is your timetable for closing out the plant and moving the equipment if it is not sold?

In each instance, members of the AEC-GSA panel expressed their greatest optimism with the statement that any such possibility is extremely remote.

In his opening remarks, Johnson emphasized that it would be the community's responsibility to fill the voids if no satisfactory disposal were achieved.

On Declining Path

"The work of ACF Indus

commercial - industrial leaders.

Need Stressed

But the most optimistic note was sounded by City Commissioner Harry Kinney, who also is on the staff of Sandia Corp., one of the AECs prime contractors:

"There is a crying need for a going operation such as this all over the country," said Kinney. "Machine operations all over — in Ohio, Illinois, Indiana and other areas —are having difficulty meeting their production schedules. They are unable to fill their need for machine tools and qualified operators."

The AEC commissioner acknowledged the accuracy of Kinney's analysis.

Both Johnson and Walter C. Moreland, deputy commissioner of the GSA, said there is a "very good chance" that the South Albuquerque Works will be taken over at an early date by the Dept. of Defense or the National Aeronautics and Space Administration (NASA) for operation by one of their contractors—long before the scheduled phase-out of ACF Industries' prime contract.

Bid Call Possible

If the plant should not be transferred to another federal agency—a transfer that could be achieved with no exchange of funds—the GSA will be prepared to open bids from prospective non-governmental purchasers no later than June of this year, said Moreland. Bids would be sought for the purchase of the plant and equipment as a single unit.

Meanwhile, Moreland said, in answer to a question from City Commission Chairman Ralph Trigg, another governmental subdivision, such as the city, could negotiate for the purchase of the plant at full appraised value.

Any purchaser could buy the plant for 20 per cent of the purchase price down with 10 years to pay the deferred balance. Interest rates would be 6 per cent to a non-governmental buyer, 5¾ per cent to a governmental unit.

Both GSA and AEC officials emphasized that the compressed timetable for the possible sale of South Albuquerque Works "is the exception rather than the rule."

"We are especially concerned when the payroll of a plant is a substantial portion of the total manufacturing payroll of its community. In this case it is about 25 per cent," said Johnson.

As soon as the decision to phase out the work load at the South Albuquerque Works was announced, the AEC "flashed the signal around the country" through the Defense Dept. and NASA letting them and their contractors know the plant would be available, Johnson said. "We have high hope that some suitable applications can be found and that it can be done fast enough that the present work force will stay here."

Johnson said special inquiry is being made to determine the source of slow deliveries on Defense Dept. and NASA contracts. Then, in the search for a suitable operator, it will be determined if slow deliveries any place can be traced to inadequate plant facilities or equipment.

"The assets of the South Albuquerque Works are quite unique," said Johnson. "Not only do we have excellent precision machine tools, but we have automatic controls."

Being Advertised

Moreland reported the availability of the plant is being advertised to other federal agencies for a 30-day period ending Jan. 27.

"We won't take two years phasing out the ACF contract unless we have to," Johnson told the civic leaders.

L. P. Gise, manager of the AEC's Albuquerque operations, said a new buyer could take over the unfinished work in the ACF contract. However, he noted, there is one operation that would take longer to phase out, and this work would have to be performed in one of the AEC's "captive plants."

Gise also reaffirmed his office's intention to place a "base load" of AEC contracts with any new operator of the South Albuquerque Works. He declined to say what a base load would entail, explaining that such a load would be flexible and negotiable, and neither the amount nor the duration of such a load could be determined in advance.

Notes City Position

In presenting a series of questions, Commissioner Trigg said, "I don't want to hold out any hope the city could take over the plant, and it would be completely impossible unless there were a contractor available to take it over from us. But we don't want to overlook our responsibility to the community. If we know the possibilities, we can go to the legislature and seek legislation that might enable us to do something."

PANELISTS: Leaders of a high-level panel which met Thursday with a cross-section of Albuquerque's leadership to consider the future role of the ACF Industries plant here are, left to right, Atomic Energy Commissioner Wilfred E. Johnson; Hugh D. Leenhouts, chariman of a seven-member task force composed of AEC officials, and L. P. Gise, manager of the AEC's Albuquerque operations. (Journal photo)

tries has been on a declining path. Its work force was up to 2700 in 1963. It is slightly over 2100 now, and it will be down to 1500 by the middle of this year.

"ACF's work adds up to about $30 million, $10 million of which is spent outside the state. Its work can be split up into two types: production and support (of other AEC contractors), the latter type accounting for about one-third but on a diminishing pattern.

"We will try to keep as much of this work in Albuquerque as we possibly can . . .

"When you lose a manufacturing job in a community, you stand to lose about three other jobs in service-type occupations, but you don't lose them all at once. It usually takes about three years for this to happen.

Can Be Alleviated

"Keeping them (the three service employes) is the job of the community itself. The problem could be alleviated if the community will pitch in and try to bring in other work.

"You have about 8200 manufacturing jobs in this community. If you lose 1500 to 2000 manufacturing jobs, you stand to lose three times as many other jobs.

"But you do have time to act. Try to get other kinds of activity in the community if you possibly can."

Both AEC and GSA officials, following the conference, commended the community representatives attending for their "constructive, positive attitude."

AEC Will Retain About One-Fifth Of ACF Force

About 20 per cent of the 2100 employes at ACF Industries will be retained here by the Atomic Energy Commission for an indefinite time, it was announced in Washington Monday.

Of that number, about 200 will be offered employment soon with the Rocky Flats Division of Dow Chemical Co., another prime AEC contractor, it was announced by L. P. Gise, manager of AEC's Albuquerque operations.

Gise also said an additional 150 to 200 ACF employes will be retained for an undetermined period of time. They will be support workers in three categories — ACF employes working in support o

Continued on A-2

AEC Will Retain Portion of Force

Continued From A-1

Sandia Laboratory test activities, ACF employes working in support of Los Alamos Scientific Laboratory's Project Rover (nuclear rocket propulsion program), and ACF employes in common support areas for the plant, such as guard and custodial forces.

Informs GSA

Sen. Clinton P. Anderson (D-NM) said the AEC has informed the General Services Administration that about 12 per cent of the plant area here must be retained for a maximum of two years. AEC officials here said this area is a special purpose area and can be isolated from other plant operations. This area would be used by Dow Chemical Co., according to the AEC, in "operations which constitute a permanent program of extreme importance to the nation's atomic weapons program."

Last month the AEC announced that it would have to sell, lease or close the plant here in a phase-out of the operation.

GSA said the plant probably will be advertised for public sale in early February. Federal agencies which may be interested in it are being contacted.

Contacts Made

Meanwhile, James O. Roberson, executive director of Albuquerque Industrial Development Service, said Monday that preliminary contacts have been made with several large industrial concerns who could use the plant and its highly-specialized facilities.

"Our negotiations, of necessity, have to be preliminary," Roberson said. "The GSA appraisal isn't complete and until we get this we can only talk in generalities.

"It is an encouraging thing that Dow is interested. The job now is to find someone to take the other 90 per cent."

Michael J. Sunderland, assistant manager of the AEC office in Denver, said Dow will move into the ACF plant as soon as possible. Dow's Rocky Flats Division is located near Denver.

See No Detraction

GSA officials, who visited the plant here last week, said retention of the approximately 60,000 square feet for Dow Chemical's operations should not detract from the sale of the plant as a going operation.

Work phaseout of ACF operations at the AEC-owned plant is scheduled to begin this spring, it was announced last month.

Walter C. Moreland, GSA deputy commissioner, said the availability of the plant is being advertised to other federal agencies for a 30-day period ending Jan. 27. Public advertising will follow if no federal agency is interested. Bids from non-government sources would be opened no later than June, Moreland said.

Richardson III, right, newly appointed head of the campaign. General Richardson is deputy commander for weapons and training at headquarters Field Command, DASA.

Richardson Named Head of FCA Here

Brig. Gen. Robert C. Richardson III has been named chairman of the 1968 combined Federal Campaign in Albuquerque, by L. P. Gise, manager of the FCA here, and president of the Federal Executive Assn.

The FCA sponsors the CFC, conducted for the first time last year, which raised $221,640 for the United Community Fund, National Health Agencies and International Services Agencies.

Previously, campaigns were conducted separately.

Gen. Richardson is a 1939 graduate of the U.S.Military Academy, and has been stationed at Sandia since July 1966.

He is a command pilot and the author of several articles on atomic warfare, strategy and concepts.

Gen. Richardson, his wife, and three children, Anne N., Robert C. IV, and Lydia F., live on Sandia Base.

L. P. Gise Of AEC Retires

1968-04-30-los-alamos-monitor-pg-1-clip-lp-gise

Lawrence P. Gise, manager of the AEC Albuquerque Operations, retires today after almost 33 years of Federal government service. He has been manager of ALO since Aug. 1, 1964.

James L. McCraw, ALO deputy manager, has been designated by the Commission's general manager R. E. Hollingsworth to be acting manager of Albuquerque Operations effective May 1. McCraw will serve until the arrival here about Aug. 1 of Lt. Gen. Harold C. Donnelly, USAF, after General Donnelly's mandatory retirement from military service after 35 years.

General Donnelly is now Director of the Defense Atomic Support Agency, Washington, D.C.

Upon his retirement, Gise will be associated in the operation of ranching interests in Southwestern Tex., with his headquarters 12 miles from Cotulla. Mr. and Mrs. Gise live on Sandia Base. They have two married children.

A native of Laredo, Tex., Gise's Federal Goverment service dates from Aug. 1935 when he joined the Department of Agriculture, as a messenger. As Chief, Administrative Service Division, Bureau of Chemistry and Engineering, he left that agency in 1942, transferring to the Public Building Administration, Washington.

Lawrence Gise, AEC Manager Here, Retires

Lawrence P. Gise ended almost a third of a century's government service Tuesday by retiring as manager of the AEC's Albuquerque Operations (ALO).

Mr. and Mrs. Gise, who live at Sandia Base, plan to become ranchers in southwest Texas. A graduate of the U. S. Military Academy, Gise served as commander, Field Command, Defense Atomic Support Agency (DASA) at Sandia Base from 1960 to 1963.

He will be succeeded by Lt. Gen. Harold C. Donnelly, who will retire this year as director of DASA in Washington. In the interim, James L. McCraw, ALO deputy manager, has been named acting manager effective today.

L. P. Gise

The Santa Fe New Mexican (Santa Fe, New Mexico) · 11 Aug 1968, Sun

AEC Names Donnelly

H. C. Donnelly will become manager of the Albuquerque operations office of the Atomic Energy Commission, which includes Los Alamos Scientific Laboratory of the University of California.

Mr. and Mrs. Donnelly recently returned to Albuquerque from Washington, following his retirement from the U.S. Air Force as a lieutenant general.

He will succeed L. P. Gise, who retired April 30 after 33 years of government service.

The AEC organization he will manage directly employs 1,285, of whom 1,000 are in New Mexico. Its major, integrated contractors employ about 30,000 of whom almost 14,000 are in New Mexico. The Los Alamos support contractor is The Zia Co.

Albuquerque Operations Headquarters are at Sandia Base, Albuquerque. The office grew out of the Los Alamos project of World War II in which scientists on the Hill developed the first atomic bomb.

U.S. Atomic Agency Ex-Official, 80, Dies

Journal Staff Report

Lawrence Preston Gise, who headed the former Atomic Energy Commission's Albuquerque Operations Office in the 1960s, died Sunday at a San Antonio, Texas, hospital. He was 80.

Born April 23, 1915, in Laredo, Texas, Gise retired from the AEC post in Albuquerque in 1968 after 33 years of government service.

He was raised in Big Wells, Texas, and was the salutatorian of the local high school graduating class of 1932. Three years later, he married Mattie Louise Strait, who had been his class valedictorian.

In the midst of the Great Depression they moved to Washington, D.C., where he began his government service as a messenger with the Department of Agriculture.

While working his way up to management positions in several federal agencies, he attended night school in Washington, D.C., earning a bachelor's degree in commercial science from Columbus University in 1938 and a master's in the same field from Strayer College in 1940.

He served in the U.S. Navy from 1942 to 1946, and was a lieutenant commander aboard the destroyer USS Neunzer during World War II.

After the war, he worked briefly for the Veterans Administration, then worked as deputy chief of the estimates and analysis division of the U.S. Navy Department's budget office.

In 1949, he went to the AEC's finance division, then transferred to AEC's division of military applications, becoming assistant director in 1955.

From 1958 to 1961, he was with the Department of Defense's Advanced Research Projects Agency, working on space technology and ballistic missile defense.

He came to AEC's Albuquerque Operations Office as deputy manager in 1961, and in 1964 was appointed by Congress to head AEC's seven-state, 26,000-employee operations, including Sandia, Los Alamos and Lawrence Livermore national laboratories.

Among awards Gise received were the AEC's outstanding service award in 1956, a federal 30-year service award in 1965, and the U.S. Navy's distinguished service award in 1967 for the Albuquerque Operations Office's contributions to the Polaris missile program.

After retiring in 1968, the Gises moved to Mrs. Gise's family ranch in South Texas.

Mrs. Gise died in 1977. Last year, he married Nona Louise Martin Pickett of Cotulla, Texas, who survives.

He was recently preceded in death by his son, Lawrence P. Gise Jr., and is survived by his daughter, Jackie Bezos of New Jersey; stepchildren Maureen Bell and C.W. Pickett, and five grandchildren.

Unprocessed notes :

https://www.businessinsider.com/jeff-bezos-biological-father-2013-10

His biological father, whose name is Ted Jorgensen, was 18 when he impregnated Bezos' mother, Jacklyn Gise, who herself was 17. They were both still in high school at the time. They got married before their son was born.

The marriage lasted only 17 months, reports Brad Stone at Bloomberg Businessweek, who has unearthed astonishing new details about Bezos' family's early years.

Gise moved in with her parents because Jorgensen stayed out late, and drank too much, and was generally an inattentive father and husband says Stone. He agreed to a divorce, and paid a small amount of child support to Gise when he had money. Other times he missed the payments.

Jorgensen, Ted, J.

Born in Chicago October 10th, 1944. Age 70, Ted relocated from Albuquerque to Glendale, Arizona in 1974; Ted passed away on March 16th, 2015. Ted owned and operated Road Runner Bike Center, a bicycle shop in Glendale, Arizona for over 35 years. Ted is survived by his wife Linda who he was married to for 27 years, his son Jeff, four step children; Mike, Todd, Lee and Darin, 10 grandchildren also brother Gordon Jorgensen, brother-in-law Ron Fischer. Services will be held at 3:00 PM Saturday March 21st at Phoenix Memorial Park 200 W. Beardsley Rd. Phoenix, Arizona 85027.

--> Born 1944, that would make him nearly 20 in 1964 when Jeff was born.

Jeffrey Preston Jorgensen

January 12, 1964 (age 55)

Albuquerque, New Mexico, U.S.

Bezos was born Jeffrey Preston Jorgensen on January 12, 1964, in Albuquerque, New Mexico, the son of Jacklyn Gise Jorgensen and Chicago, Illinois native Ted Jorgensen.[4] At the time of his birth, his mother was a 17-year-old high school student, and his father was a bike shop owner.[5]

--> Jeff has4 children.. Children 4

https://bambooinnovator.com/2013/10/11/the-secrets-of-bezos-how-amazon-became-the-everything-store/

Jeff Bezos grew up in a tight-knit family, with two deeply involved and caring parents, Jackie and Mike, and two close younger siblings, Christina and Mark. Jackie, who gave birth to Bezos just two weeks after she turned 17, was a towering figure of authority to Bezos and his friends. Mike, also known as Miguel, was a Cuban immigrant who arrived in America at age 18, alone and penniless, knowing only one English word: hamburger. Through grit and determination, he got a college education and climbed through the ranks of Exxon (XOM) as a petroleum engineer and manager, in a career that took the Bezos family to Houston, Pensacola, Fla., Miami, and, after Bezos left for college, cities in Europe and South America.

Yet for a brief period early in his life, before this ordinary if peripatetic childhood, Bezos lived alone with his mother and grandparents. And before that, he lived with his mother and his biological father, a man named Ted Jorgensen. Bezos has said the only time he thinks about Jorgensen is when he's filling out a medical form that asks for his family history. He told Wired in 1999 that he'd never met the man. Strictly speaking, that's not true: Bezos last saw him when he was 3 years old. And while Bezos's professional life has been closely studied and celebrated over the last two decades, this story has never been told.

Jorgensen was a circus performer and one of Albuquerque's best unicyclists in the 1960s. A newspaper photograph taken in 1961, when he was 16, shows him standing on the pedals of his unicycle facing backward, one hand on the seat, the other splayed theatrically to the side, his expression tense with concentration. The caption says he was awarded "most versatile rider" in the local unicycle club.

That year, Jorgensen and a half-dozen other riders traveled the country playing unicycle polo in a team managed by Lloyd Smith, the owner of a local bike shop. Jorgensen's team was victorious in places such as Newport Beach, Calif., and Boulder, Colo. The Albuquerque Tribune has an account of the event: Four hundred people showed up at a shopping center parking lot in freezing weather to watch the teams swivel around in four inches of snow wielding three-foot-long plastic mallets in pursuit of a six-inch rubber ball. Jorgensen's team swept a doubleheader, 3 to 2 and 6 to 5.

In 1963, Jorgensen's troupe resurfaced as the Unicycle Wranglers, touring county fairs, sporting events, and circuses. They square-danced, did the jitterbug and the twist, skipped rope, and rode on a high wire. The group practiced constantly, rehearsing three times a week at Smith's shop and taking dance classes twice a week. "It's like balancing on greased lightning and dancing all at the same time," one member told the Tribune. When the Ringling Brothers and Barnum & Bailey Circus came to town, the Wranglers performed under the big top, and in the spring of 1965 they performed in eight local shows of the Rude Brothers Circus.

Jorgensen was born in 1944 in Chicago to a family of Baptists. His father moved the family to Albuquerque when Jorgensen and his younger brother, Gordon, were in elementary school. Ted's father took a job as a purchase agent at Sandia Base (today's Sandia National Laboratories), then the largest nuclear weapons installation in the country, handling the procurement of supplies at the base.

In high school, Jorgensen started dating Jacklyn Gise, a girl two years his junior whose father also worked at Sandia Base. Their dads knew each other. Her father, Lawrence Preston Gise, known to friends as Preston and to his family as Pop, ran the local office of the U.S. Atomic Energy Commission, the federal agency that managed the nuclear weapons program after Harry S Truman took it from the military following World War II.

Jorgensen was 18 and finishing his senior year in high school when Gise became pregnant. She was a sophomore. They were in love and decided to get married. Her parents gave them money to fly to Juárez, Mexico, for a ceremony. A few months later, on July 19, 1963, they repeated their vows at the Gises' house. Because she was underage, both of their mothers signed the application for a marriage license. The baby was born on Jan. 12, 1964. They named him Jeffrey Preston Jorgensen.

The new parents rented an apartment in Albuquerque's Southeast Heights neighborhood. Jackie finished high school, and during the day, her mother, Mattie,

took care of the baby. Life was difficult. Jorgensen was perpetually broke, and they had only one car, his cream-colored '55 Chevy. Belonging to a unicycle troupe didn't pay much. The Wranglers divided their fees among all members, with Smith taking a generous cut off the top. Eventually, Jorgensen got a $1.25-an-hour job at the Globe Department Store, part of Walgreen's (WAG) short-lived foray into the promising discount retail market being pioneered at the time by Kmart (SHLD) and Wal-Mart. Occasionally Jackie brought the baby to the store to visit.

Their marriage was probably doomed from the start. Jorgensen had a habit of drinking too much and staying out too late. He was an inattentive dad and husband. Jackie's father tried to help him; he paid his son-in-law's tuition at the University of New Mexico, but Jorgensen dropped out after a few semesters. Preston Gise then tried to get Jorgensen a job with the New Mexico State Police, but Jorgensen wasn't interested.

Eventually, Jackie took the child and moved back in with her parents at Sandia. In June 1965, when the baby was 17 months old, she filed for divorce. The court ordered Ted to pay $40 a month in child support. Court records indicate that his income at the time was $180 a month. Over the next few years, he visited his son occasionally but missed many support payments.

Then Jackie took a job working in the bookkeeping department of the Bank of New Mexico and met Miguel Bezos, who was working the overnight shift while he attended the University of Albuquerque. On several occasions when Ted was visiting his son, Bezos would be there, and they avoided each other. But Ted asked around and heard he was a good man.

In 1968, Jackie called Ted and told him she was marrying Miguel and moving to Houston. She told him he could stop paying child support and asked him not to interfere in their lives. Her father confronted him and made him promise to stay away. Jackie also wanted to give Jeffrey her new husband's surname and let Miguel adopt him. Ted's permission was needed for the adoption. After thinking it over and reasoning that the boy would probably have a better life as the son of Jackie and her new husband, Ted obliged. After a few years, he lost track of the family and then forgot their last name.

Star Tribune (Minneapolis, Minnesota) • 29 Dec 1963, Sun • Page 54

Stonhouse and Barnes Vows Read

Sandra Barnes was married to John F. Stonhouse at St. George's Episcopal Church, St. Louis Park, Saturday. Parents are Mr. and Mrs. W. E. Barnes, 5016 Skyline Dr., Edina, and Mr. and Mrs. O. K. Nora, of Anoka and of Pompano Beach, Fla.

A reception was held at Interlachen Country Club.

Attendants were Margaret Patten, Nancy Tanner, Mrs. Richard Fisher, Reuben Larson, Peter Pirsch, David Barnes, Preston Gise Jr., and Richard Fisher.

The bride graduated in education from University of Minnesota. She is a teacher and a member of Association for Childhood Education. The groom graduated from University of Virginia where he was a member of Sigma Chi. He is in personnel department of Control Corp.

The couple will live at 8209 W. 30½ St., St. Louis Park, after a skiing trip to northern Minnesota.

Control Data had purchased Control Corp. - (1960 news)

Full page : [HN00NN][GDrive]

Control Data Buys Control Corp.; Price Put at Two Millions

Control Data Corp., 2½-year-old electronic computer manufacturer, is buying a 24-year-old Minneapolis control systems firm for an estimated two million dollars.

Directors of CDC and Control Corp. have agreed to an exchange of common stock in which Control Corp. will become a subsidiary of the computer maker.

★ ★ ★ ★

Sandberg

Norris

William C. Norris, president of Control Data, and Mrs. Perry Peterson, widow of the founder of Control Corp., announced today that the proposal will be submitted to a vote of stockholders of both companies on March 18.

Mrs. Peterson

The exchange would be on a basis of all of the 113,581 outstanding common shares of Control Corp. for 68,149 common shares of Control Data, or at a rate of five shares of Control Corp. for three shares of Control Data.

This would indicate a price of slightly more than two million dollars for the acquisition, valuing Control Data stock at $30 per share, the approximate market value it claimed at the time the deal was negotiated.

Letters explaining the proposal were being mailed to stockholders today.

Mrs. Peterson, who is a director, assistant treasurer and a principal stockholder of Control Corp., will become chairman of the board when the company becomes a subsidiary corporation of Control Data.

Mahlon Sandberg, who has been Control Corp. president since 1958, will continue as president.

"This acquisition will combine Control Data's high performance digital computers with the electronic industrial and public utility control systems which are the specially of Control Corp.," Norris said.

"Thus the combined companies can offer much more comprehensive electronic systems for larger and more varied applications."

Norris said the two companies have been collaborating on proposals and engineering for more than a year.

Control corporation's sales for the year ended Dec. 31 were about two million dollars. It has 180 employes. Control Data's sales for the same period were about seven million dollars. It has 525 employes.

Norris also pointed out that while SDC's business has been primarily with the federal government, Control Corp. has been primarily in commercial business.

Control Corp. makes electronic supervisory control systems under the trade name Super-Trol, used chiefly by utilities to control the transmission and distribution of electric power, water, oil and natural gas. It also makes telephone type plug-in relays, automatic battery chargers, transformers, motor controls and generator synchronizers.

Two toy firms in city to hold vote on merger

Merger of two Minneapolis-based toy companies, Lakeside Industries, Inc., and privately held Leisure Dynamics, Inc., will be put before their stockholders at special meetings, it was announced by officials of the two companies.

The agreement calls for Lakeside to issue 1.5 million shares of common stock for all the stock of Leisure Dynamics. Lakeside shares have been trading over the counter for $7.25 bid, giving the merger value of at least $10.88 million.

L. Preston Gise Jr., president of Leisure Dynamics, and Zelman Levine, founder and president of Lakeside, said there will be 2,171,917 shares of the merged com- is approved. The combined company will have sales in excess of $20 million, they said.

Leisure Dynamics, a three-month-old firm, last month acquired a California manufacturer of gasoline-powered model airplanes and cars. It recently completed an equity financing of approximately $5.5 million.

Gise is a former executive of Parker Brothers, Inc., and of Rainbow Crafts, Inc., subsidiaries of General Mills. H. Allan Hatfield, executive vice - president of Leisure Dynamics, formerly was an officer of Craft Master Corp., another General Mills subsidiary.

Lakeside manufactures and distrubutes lines of toys and games and advertising signs.

Investment 'names' in merger

Some rather substantial names in the investment world were linked in a merger announced Monday between Lakeside Industries, Inc., and Leisure Dynamics, Inc.

Lakeside is a Minneapolis-based maufacturer of games, toys and indoor advertising displays. Leisure, a closely-held company formed in January to acquire businesses in the leisure, game and toy field, already operates a Califorina model-making firm.

Leisure shareholders include Sherman M. Fairchild, chairman of the board of Fairchild Hiller Corp.; Louis F. Polk Jr., president of Metro-Goldwyn-Mayer, Inc.; Samuel Bronfman, president of Distillers Corp. - Seagram, Ltd.; Arthur K. Watson, vice-chairman of the board of IBM; Investors Diversified Services, Inc., and Wheelock Whitney, chief executive officer of Dain, Kalman Quail & Co.

Lakeside to survive

Lakeside will be the surviving company, but its name will be changed to Leisure Dynamics. Combined sales for the two companies, based on the year ended March 31, 1969, will be $19.8 million annually.

L. Preston Gise Jr. will become president of the new company when the merger becomes effective Sept. 2. M. Allen Hatfield, executive vice - president of Leisure, will become executive vice-president and treasurer of the merged company.

Lakeside president Zelman Levine will continue to head Lakeside as a division of Leisure.

Directors of the merged company include Louis F. Polk Sr., member of the executive committee and director of the Bendix Corp.; Louis F. Polk Jr., the former General Mills vice - president who moved into the presidency of MGM recently, and Russell Bennett, Minneapolis attorney.

Other directors include Walter Burke, financial advisor to Sherman Fairchild; Warren S. Farrell, of Fairchild's investment staff; Richard N. Flint, partner in Cant, Haverstock, Gray,

Polk

Whitney

Bennett

Flint

Plant and Mooty (as is Bennett); Daniel R. Kaplan, New York; Donald R. Stroben, executive vice - president of Hayden, Stone, Inc., investment bankers, plus Gise, Hatfield and Levine.

Lakeside reported sales of $2.5 million for the three months ending March 31, down 19 percent from the comparable quarter in 1968. Its loss for the period was $830,182, or $1.24 a share. In 1968 the comparable loss was $118,219, or 18 cents a share.

An inventory writedown resulting from a change operating policy resulted a large part of the loss, vine said. Future perf mance should be streng ened by streamlined ope tions, he said.

Lakeside will issue 1.5 n lion shares of its comm stock in exchange for all o standing capital stock Leisure. Its shareholders a voted to approve an incre in its common stock fr 1,250 million shares to 4 n lion, and creation of 1 n lion new shares of prefer stock to be issued at discretion of the directors.

1971 L Preston Gise Jr - Leisure Dynamics

Full page : [HN00NC][GDrive]

Artex, Leisure Dynamics Merging

A preliminary agreement has been signed for acquisition of the Lima-based Artex Hobby Products Inc. by Leisure Dynamics Inc., a growing, three-year-old "leisure concept" craft, game and toy company with headquarters in Minneapolis.

Artex will become a wholly owned subsidiary of Leisure Dynamics, according to Saturday's announcement from Charles H. Crockett III, Artex president and board chairman, and from L. Preston Gise Jr., Leisure Dynamics president.

Current value of the transaction is estimated at $13 million.

Completion of the merger is subject to acceptance of a definitive agreement by the boards of both companies and the shareholders of Artex.

Preliminary terms are for Leisure Dynamics to exchange seven-tenths of a share of its common stock for each share of Artex stock. The actual exchange rate will be determined after Artex earnings are known for the period ending Dec. 31.

Artex currently has 1,416,199 shares of common stock outstanding. Both Artex and Leisure Dynamics stock is traded on the national over-the-counter market.

Although no definite closing date has been set, it is anticipated the merger will be completed during the first quarter of 1972.

Crockett will continue as Artex president and board chairman, but also will become a Leisure Dynamics vice president and board member. He also will become the largest single stockholder in Leisure Dynamics.

Artex Hobby Products will continue to maintain its headquarters and manufacturing facilities in Lima.

Leisure Dynamics was established by three former General Mills executives — Gise, Allen Hatfield and Louis F. Polk Jr., who for a time also was president of Metro-Goldwyn-Mayer. While at General Mills, the three spearheaded that Minneapolis giant's diversification into the toy and game business.

Leaving General Mills, they created Leisure Dynamics to build a new toy, game and hobby company through acquisitions. Major financing came from Polk; his father, Louis F. Polk Sr.; Sherman M. Fairchild of Fairchild Camera; Arthur K. Watson of IBM; and Samuel Bronfman of Distillers Corp.-Seagrams Ltd.

Leisure Dynamics acquired a Santa Ana, Calif., firm, L. M. Cox Manufacturing Co., the world's largest maker of gasoline engine-powered model planes, cars and racers, plus solid fuel rockets. A second acquisition was Lakeside Industries Inc. of Minneapolis, a toy and game manufacturer and the largest producer of point-of-purchase sales displays for the brewing industry. Another purchase was Merry Manufacturing Co., Cincinnati, which has been absorbed into Lakeside.

Among popularly known game and toy products marketed by Leisure Dynamics are Barrel of Monkeys, which has sold 12 million; Aggravation, with 1.3 million annual sales; Kismet; Pick Up Sticks; Score Four, with half-million annual sales; and the Miss Merry play makeup line for girls.

Leisure Dynamics sales for the fiscal year ending March 31, 1971, exceeded $30 million, with earnings of $1,380,797 or 63 cents per share. For its six-month period ending Oct. 31, the company's sales were $16 million, producing earnings of $863,000 or 38 cents per share.

Earlier this week, on Thursday, an agreement was signed for Leisure Dynamics to acquire Eldon Industries Inc. of Hawthorne, Calif. That company produces model road racing sets, woodburning and electrical craft sets, model boats and battery-operated children's riding vehicles.

With the acquisition of Artex and Eldon, Leisure Dynamics expects annual sales to top $43 million.

Artex sales showed an average annual growth rate of 23 per cent for the last five years. For the most recent fiscal year, ending June 30, 1971, Artex sales of $7.5 million produced earnings of $463,877 or 32 cents per share. For the quarter ending Sept. 30, sales were $1,767,503, with earnings at $131,161 or nine cents a share.

Using direct - selling, home party plan distribution, Artex designs, produces and markets a line of 60 indelible, free-flowing paints in ballpoint tubes, used as a home craft for creating colorful designs on fabrics, paper, wood, leather, metal, glass and plastic. The company also offers hundreds of fabric items for decorative use of its paints.

Some 9,000 Artex instructors conduct more than 200,000 home parties in the U.S. and Canada annually to demonstrate and sell the company's craft products.

Artex was founded here by Crockett and his wife, Shirley, and was incorporated in 1963.

Star Tribune (Minneapolis, Minnesota) · 09 Dec 1972, Sat · Page 12

Leisure Dynamics acquires game unit

Leisure Dynamics, Inc. Friday said it acquired the game division of Reed Toys, Inc., West Conshohoken, Pa., for an undisclosed amount of cash and notes.

L. Preston Gise Jr., president of Leisure Dynamics, said the company will integrate the operations of the Reed Toys game division into its Minneapolis production facility.

Gise also said Leisure Dynamics has stopped taking new orders for its point-of-sale advertising division and will be completely out of that business by March 31. The division manufactures advertising displays that are used to promote products in places where the products are sold.

He said the move will provide additional plant capacity at the Minneapolis facility to accommodate increasing sales of its hobby, game and toy product lines. Negotiations for sale of the point-of-sale division are continuing.

He said the division had a backlog of orders totaling $2.6 million and that all will be produced in the next several months.

In the six months ended Sept. 30, Leisure Dynamics said sales of its hobby, game and toy lines reached $17,585,664, up 30 percent over $13,555,748 in the comparable period a year ago.

The point-of-sales division, which accounts for approximately 5 percent of total company sales, lost money during the period.

THURSDAY, NOVEMBER 16, 1995 C15

U.S. Atomic Agency Ex-Official, 80, Dies

Journal Staff Report

Lawrence Preston Gise, who headed the former Atomic Energy Commission's Albuquerque Operations Office in the 1960s, died Sunday at a San Antonio, Texas, hospital. He was 80.

Born April 23, 1915, in Laredo, Texas, Gise retired from the AEC post in Albuquerque in 1968 after 33 years of government service.

He was raised in Big Wells, Texas, and was the salutatorian of the local high school graduating class of 1932. Three years later, he married Mattie Louise Strait, who had been his class valedictorian.

In the midst of the Great Depression they moved to Washington, D.C., where he began his government service as a messenger with the Department of Agriculture.

While working his way up to management positions in several federal agencies, he attended night school in Washington, D.C., earning a bachelor's degree in commercial science from Columbus University in 1938 and a master's in the same field from Strayer College in 1940.

He served in the U.S. Navy from 1942 to 1946, and was a lieutenant commander aboard the destroyer USS Neunzer during World War II.

After the war, he worked briefly for the Veterans Administration, then worked as deputy chief of the estimates and analysis division of the U.S. Navy Department's budget office.

In 1949, he went to the AEC's finance division, then transferred to AEC's division of military applications, becoming assistant director in 1955.

From 1958 to 1961, he was with the Department of Defense's Advanced Research Projects Agency, working on space technology and ballistic missile defense.

He came to AEC's Albuquerque Operations Office as deputy manager in 1961, and in 1964 was appointed by Congress to head AEC's seven-state, 26,000-employee operations, including Sandia, Los Alamos and Lawrence Livermore national laboratories.

Among awards Gise received were the AEC's outstanding service award in 1956, a federal 30-year service award in 1965, and the U.S. Navy's distinguished service award in 1967 for the Albuquerque Operations Office's contributions to the Polaris missile program.

After retiring in 1968, the Gises moved to Mrs. Gise's family ranch in South Texas.

Mrs. Gise died in 1977. Last year, he married Nona Louise Martin Pickett of Cotulla, Texas, who survives.

He was recently preceded in death by his son, Lawrence P. Gise Jr., and is survived by his daughter, Jackie Bezos of New Jersey; stepchildren Maureen Bell and C.W. Pickett, and five grandchildren.

Maybe Her Favorite Nephew

A trust benefiting an aunt of Amazon.com founder and Forbes 400 member Jeffrey P. Bezos reaped $45 million in gains largely from selling off Amazon shares in the two years after the Internet bookseller's 1997 initial public offering. U.S. Tax Court lawsuits say financial advisers to Priscilla C. Gise of Tonka Bay, Minn. pushed for the sales to diversify the portfolio. Whatever the reason, their timing was excellent; Amazon's stock price, which peaked at $107 in late 1999, fell 90% over the next two years and only recently has climbed above $50. The two lawsuits challenge the Internal Revenue Service's demand for $180,000 in additional 1998 and 1999 taxes. The fed had alleged that income was omitted and improper deductions were taken.

2019 **Tribute to CSE leader and professor Hellmut Golde (University of Washington)**

[HE0031][GDrive]

The Allen School family is mourning the loss of our friend and colleague Hellmut Golde, who passed away earlier this month after a brave battle against cancer. As one of the founding members of the Computer Science Group at the University of Washington and leader of the team that developed the wildly successful VAX Pascal compiler, Golde's legacy includes the emergence of the Paul G. Allen School of Computer Science & Engineering as an education and research powerhouse and the emergence of the Seattle region as a hub of computing innovation.

Golde, who grew up in Germany, joined the UW faculty in 1959 as a professor in the Department of Electrical Engineering after earning his Ph.D. from Stanford University. He was one of the founders of the Computer Science Group in 1967, the precursor to the Department of Computer Science, formed in 1974, which evolved into the Department of Computer Science & Engineering in 1989 and eventually into the Paul G. Allen School in 2017. In those early days, Golde played a crucial role in establishing the culture for which the Allen School is widely known — one of friendship, support, and community.

A few years after he helped lead the creation of the Computer Science Group, Golde became director of the Computer Science Laboratory, the research and educational facility that hosted a couple of aspiring computer scientists, Paul Allen and Bill Gates, in the days before they set out to put a computer on every desktop. Back then, the pair would sneak into the lab and "borrow" computer time, as Gates would later describe it. Golde would cement his place in campus lore by famously expelling Allen and Gates from the lab.

"Dear Mr. Allen…."

Delivering his rebuke via a polite yet sternly worded letter, Golde directed Allen to "turn in your keys and terminate your activities" owing to offenses such as "you removed the acoustic coupler from Dr. Hunt's office without authorization and without leaving at least a note." At the celebration of the naming of the Allen School more than 40 years later, Allen astonished Golde and the rest of the audience by pulling out the letter and reading it in its entirety as he reminisced about his long-standing affection for UW. Allen subsequently framed two copies of Golde's letter as mementos for the school and for Golde, while we attempted to make amends for the decades-old rebuke by gifting Allen an acoustic coupler purchased on eBay.

Professor emeritus Richard Ladner, who joined the department in 1971, fondly recounted the ease with which Golde bridged the divide in their academic interests and became not only a colleague but lifelong friend. "Hellmut was one of the first people I met when I interviewed for a faculty position at the University of Washington. We were miles apart in terms our academic interests, me a mathematician and he an electrical engineer," Ladner recalled. "Nonetheless, we hit it off because of his infectious sense of humor and overall kindness. Some of my fondest memories of days with Hellmut are skiing with him and his family at Alpental, Mount Baker, Stevens Pass, and Big Sky. It was always hard for me to keep up with him on the slopes."

Golde later stepped in to serve as acting chair of the department from 1976 to 1977. It was a period of transition for our program, and Golde wasn't given much of a choice in the matter — the first department chair, his dear friend Jerre Noe, had declared himself a sabbatical after coming to the realization that if he didn't leave town, he might wind up being chair for life. At the time, the department had a grand total of 11 faculty and had graduated 25 students.

Hellmut Golde served as acting chair of UW CSE from 1976 to 1977

As Golde was completing his time as chair, Ed Lazowska arrived to join the UW faculty one week after completing his Ph.D. — and just one week before the start of the school year. His new colleagues tried to reassure him that he didn't need to worry, because "the course you've been assigned has been taught for many years by Hellmut Golde. He's the best teacher in the department. Ask him for his notes." Unfortunately for Lazowska, "Hellmut was such a good teacher that those 'notes' consisted of a single page, with a single line for each day of the course specifying the topic to be covered that day," Lazowska laughed. "Let's just say that my course evaluations were not as good as Hellmut's had been."

Although Golde's time at the helm was short-lived, he had an outsize impact on the program beyond the recruitment of Lazowska and Ladner — each of whom went on to have an outsize impact of their own on the growth of our program and on our emergence as a leader in accessible computing, respectively. In October 1977, Digital Equipment Corporation (DEC) introduced the VAX-11/780 computer, which became the mainstay of many computer science departments and companies nationwide. UW managed to acquire an early VAX on the understanding that Golde and a group of graduate students would write a VAX compiler for the Pascal programming language, which was widely used for introductory programming.

"DEC was willing to give Hellmut a portion of sales for the VAX Pascal compiler because they greatly underestimated the demand for Pascal and the market for the VAX computer in education," explained Allen School Director Hank Levy, who was a member of DEC's VAX design and development team at the time. "Partly as a result of the compiler that Hellmut and his team built, the VAX become highly successful in educational institutions, resulting in more than $1 million in royalties flowing from DEC to the department — a not insignificant sum in those days. These funds were crucial in allowing the department to grow during difficult financial times on campus. It was Hellmut's foresight, technical acumen, and generosity which allowed the department to preserve its momentum — and later, to climb into the ranks of the top 10 computer-science programs in the nation."

It appears that Hellmut neglected to return a Selectric typewriter that he borrowed in 1976. We trust that UW's Equipment Inventory Office is on the case!

The VAX-11/780 computer on display in the Allen Center atrium stands as a monument to those days, when this single computer could support the entire department's computing needs.

As Ladner noted, Golde enjoyed a good joke — even if it came at his own expense. He was particularly amused at people's inability to reckon with the pronunciation of his German name. "Hellmut used to display on his office door a montage of address labels from letters people sent him on which his name had been butchered," recalled Lazowska. "He would say 'Hellmut Golde' on the phone, and often the person on the other end wouldn't get it *quite* right. My personal favorite was the time someone addressed a letter to 'Hal McGoldy.'"

Always a leader and forever a friend, Hellmut retired from UW as emeritus professor in 1992 but remained actively engaged with his Allen School family. We miss him greatly.

A celebration of Hellmut's life will be held on Sunday, June 2, 2019 at 2 pm at the Bill & Melinda Gates Center for Computer Science & Engineering at the University of Washington. Please contact Beth Golde (beth at golde.org) for details if needed. Remembrances, in lieu of flowers, may be made to the Hellmut Golde Endowed Scholarship in Computer Science & Engineering at the University of Washington, or the Golde Family Scholarship Fund at Heritage University.

An official obituary may be found here. Photographs of Hellmut through the years may be found here.

Hellmut Golde

Hellmut Paul Oscar Golde was born in Berlin, Germany on February 6, 1930. He passed away in his home surrounded by his family on April 17, 2019. He came to the United States in 1952 as one of the first German Fulbright Scholars at Stanford University. After receiving his PhD, he and his wife Marcy moved to Seattle, where he took a faculty position at the University of Washington. In the 1960s, Hellmut helped found the UW Department of Computer Science and Engineering. He also headed the Computer Laboratory, and famously revoked access privileges from then high-school students Bill Gates and Paul Allen. Teaching was his real love, and he is remembered with deep affection by many former students.

Source : Geekwire : [HM000Y][GDrive]

Paul Allen's historic gift to the University of Washington's computer science and engineering program came with another bit of history on Thursday.

The letter to Paul Allen. (LinkedIn Photo)

In a post on LinkedIn, the Microsoft co-founder shared a 1971 letter that he received as a high school senior, informing him that he would no longer have access to the UW's graduate computer lab.

Allen said that it is "truly an honor" that his name will be attached to a new computer science school thanks to his $40 million gift. But the letter, which Allen held onto for 46 years, shows a less-welcoming attitude toward the future billionaire philanthropist.

While his father was associate director of libraries, Allen and his friends from Seattle's Lakeside School spent a good amount of time in the Computer Science Laboratory. The letter from the lab director, Dr. Hellmut Golde, informed Allen that that privilege was being revoked and why.

We squinted and attempted to re-type it here for easier reading:

> March 17, 1971
>
> Dear Mr. Allen,
>
> I regret to have to write this letter to you and your friends from the Lakeside School, but the needs of the Computer Science Program leave me with no other alternative.
>
> During the past months, you and your friends have been using the facilities of the Computer Science Laboratory to develop a software product for a commercial timesharing system in Portland. While I am basically in sympathy with such activities, your use of the laboratory facilities has caused a number of complaints and tends to disrupt the intended use of the laboratory. To be more specific, let me cite a number of specifics:
>
> 1. You have used the teletypes (at times all of them simultaneously) for prolonged periods of time and occasionally unattended, to produce endless listings. This creates a noise level in the laboratory which is detrimental to the normal activities and also is not the intended mode of operation for a remote console.
>
> 2. You have used the EMIAC system to connect to the Portland system without prior checkout on that device. While you and some of your friends subsequently obtained a drivers license for the EMIAC, I have just discovered that your friends did not get a drivers license for the Sigma 5, which was clearly announced to be a prerequisite.
>
> 3. Earlier this week you removed the acoustic coupler from Dr. Hunt's office without authorization without leaving at least a note. Such behavior is intolerable in any environment.
>
> In view of these and other occurrences which caused a number of complaints from the regular users of the laboratory, I must ask you to turn in your keys and terminate your activities in the laboratory immediately. Please inform you friends of this letter.
>
> Sincerely,
>
> Hellmut Golde
>
> Director, Computer Science Laboratory

Allen goes on to explain in his LinkedIn post that the UW is a special place for him because it's where he and fellow Microsoft co-founder Bill Gates built their Traf-O-Data machine. That effort, to automate the traffic-measuring process, ultimately ended up being a failure, but Allen said "the understanding of microprocessors we absorbed was crucial to our *future* success."

"If it hadn't been for our Traf-O-Data venture, and if it hadn't been for all that time spent on UW computers, you could argue that Microsoft might not have happened," Allen said.

NYTimes - [HN01B8][GDrive]

Sharing the Supercomputers

By John Markoff

- Dec. 29, 1988

Computer scientists and Government officials are urging the creation of a nationwide "data superhighway" that they believe would have a dramatic economic impact, rivaling that of the nation's interstate highway system.

This highway would consist of a high-speed fiber-optic data network joining dozens of supercomputers at national laboratories and making them available to thousands of academic and industry researchers around the country. Vital Competitive Tool

A national research network is vital, backers of the concept say, because it will help protect an important area where the United States now has a clear technological advantage over Japan and Europe.

America's lead in computer networking is largely a result of Pentagon financing in the mid-1970's for Arpanet, a system that linked universities, corporate research centers and military laboratories.

The new network would cost about $400 million and could be in place by the mid-1990's, its proponents say. Many existing high-speed networks can send 1.5 million bits of data a second, equivalent to one good-sized novel every five seconds. Each second the new network could carry 3 billion bits of data, or 3 gigabits -about 500 copies of that hefty novel. New Kind of Research

Legislation introduced in October by Senator Albert Gore, Democrat of Tennessee, included initial financing for development and construction of a National Research Network. Backers of the measure say that Federal financing for the project is necessary to develop the technology and convince industry that vastly speedier computer networks are commercially viable.

The network would pave the way for a new kind of scientific research in which thousands of scientists around the country could use the most complex and expensive equipment as if they were seated right in front of it.

Officials at the National Science Foundation envision computerized "collabatories" in which scientists using computer work stations could directly view and control the output of complex machines, such as particle accelerators, wind tunnels, telescopes and nuclear reactors, even though they were thousands of miles from the actual apparatus.

"I believe we can make an electronic laboratory in which people can collaborate and access information, effectively independent of location," said William Wulf, an assistant director of the National Science Foundation. "You'll never replace eyeball-to-eyeball communication, but you can substitute a lot." Remote Control

For example, a fiber-optic computer network would permit astronomers using a radiotelescope array in California to process the images on a Cray supercomputer in Illinois and then view pictures instantly, while at the same time controlling the telescope remotely from locations in both California and Maryland.

However, proponents of the idea note that putting it in place requires development of new fiber-optic communication links that are thousands of times faster than today's commercially available networks. All this could take as long as five years.

Fiber-optic networks, based on glass strands roughly the size of a human hair, use pulses of laser light instead of electricity to send computer data. They permit hundreds or thousands of simultaneous computer conversations by packaging each message into small packets consisting of 1's and 0's.

Because messages are broken up into packets, many of them can be simultaneously interwoven onto a single fiber cable and then recombined as separate messages at the other end. High-speed fiber-optic cable is already used widely for voice and video applications, but data applications have lagged until now because further technological developments are still necessary. Electronic 'Handshakes'

Researchers say they still need to develop special computer switches capable of handling the high rates of data and perfect the necessary high-speed electronic "handshakes" that one computer must make with another when data are exchanged. But the experts believe these tasks will not be difficult to accomplish within five years.

When the Pentagon's Defense Advanced Research Projects Agency built the Arpanet network, it paved the way for the industry that links commercial computers.

However, many researchers point to big government-financed high-speed computer networking projects now under way in both Japan and Europe. They are concerned that without a coordinated response United States industry will be in danger of losing its lead in developing the next generation of technology.

"It's possible that if we simply let a completely self-motivated marketplace develop our data communications infrastructure for the future it will be either inferior to what is being developed in Japan or Europe or owned by companies in Japan and Europe," said Russell Neuman, a political scientist at the Massachusetts Institute of Technology Media Lab. Difficult to Put to Use

One continuing problem that worries researchers is that in the past it has proved difficult to put the technology to use.

"Many times the technology has been there but there doesn't seem to be a path for transferring it from the research laboratories to the commercial market," said David Farber, a computer scientist at the University of Pennsylvania. "We want to show the commercial side that there is a use for this technology."

The proposed network would serve as a demonstration project to encourage private industry to develop similar super-fast commercial data links.

"The infrastructure we will need in the 21st century goes beyond traditional public works projects," Senator Gore said. "I envision a national computer network linking academic researchers and industry, using the nation's vast data banks as the raw material for increasing industrial productivity and creating new products."

Until now, supercomputers -which are increasingly essential for scientific and technical progress -have largely functioned as computing oases, isolated from thousands of potential users. The idea underlying the construction of a high-speed network is based on what economists refer to as the "turnpike factor." Modern highway interchanges have been found to attract traffic simply by their existence. Distance Is No Object

"We want to eliminate distance as a factor," said Robert Haber, a mechanical engineer who directs a high-speed networking project at the National Center

for Supercomputer Applications at the University of Illinois at Urbana-Champaign. "You can compare this to the kind of things that happened in the 50's in the United States. We need a project of the scale of a National Highway Project for computer information."

Researchers also believe that an initiative to build a national system is essential because existing networks are badly overloaded, causing the equivalent of computer traffic jams.

"We have 2,000 users who need to transfer huge amounts of data, and the current networks aren't set up for that," said Steven Christensen, an astrophysicist at the National Center for Supercomputing Applications. "There is already a large bottleneck for many of those who want to use our machines from remote cities."

During the last two years the National Science Foundation has attempted to alleviate some of the worst overcrowding by establishing a new research network known as Nsfnet. In July, a 1.5-megabit-per-second expansion of that network, which links the five national supercomputing centers with about 200 universities, was installed. Stopgap Measures

However, such incremental increases in speed are viewed as only stopgap measures. Senator Gore's bill provided for a network that sat at the top of a hierarchy of existing networks now operated by different Government agencies, like the Energy Department, the Defense Department and the National Aeronautics and Space Administration. The smaller branches would feed into the faster N.S.F. network just as smaller streams feed into a large river.

Once the gigabit network is in place, researchers will be able to begin developing new applications.

For example, Hellmut Golde, a computer scientist at the University of Washington, is beginning to work out a way to control complex instruments over a high-speed network. He is working with a nuclear physicist at the University of Washington who is interested in permitting students at different campuses to share a training reactor. These training systems are scarce, and Mr. Golde's idea is to re-create the control room for such a system at several locations.

He acknowledged that advances in computer security would have to be made before a nuclear reactor would be accessible on a computer network.

Researchers at campuses around the country have already begun planning regional high-speed networks that will offer a preview of some of the services of the future gigabit network. Scientists at the University of Pennsylvania and Princeton and researchers at I.B.M.'s Watson Research Laboratories have proposed a fiber-optic network to link the three research centers. Named the Hourglass Project, the network would permit medical specialists at Princeton and Penn to share high-resolution X-rays or other radiological images. 'Video Wall'

The network would also make possible a "video wall," a video conference system with extraordinary resolution. Such a system would in many ways permit researchers to interact as if they were seated in the same room even though they were actually separated by hundreds of miles.

Another proposal by the Corporation for National Research Initiatives in Reston, Va., calls for the creation of a digital library, a computer data base that would permit vastly improved access to information for researchers and students. "From any work station you should be able to specify a document if it exists anywhere in the country and then view it directly," said Robert Kahn, president of the corporation. Mr. Kahn, a former director of the Defense Advanced Research Projects Agency, has been a key sponsor of the idea of creating a gigabit network to link research centers and universities.

Herman Khan ??

Technology for creating such a national library is one area where Japan may be ahead of the United States. Researchers at Japan's National Center for Science Information Systems are well on their way toward putting the entire scientific literature of the country on-line.

Gould Storage Battery Corporation

The History of Exide Technologies

[HC000D][GDrive]

The History of Exide Technologies

The rich corporate history of Exide Technologies demonstrates its position as a forerunner of industrial advancement around the world. With countless contributions to the growth of technology, the company's story reflects the spirit of innovation at its best.

The Electric Storage Battery Company

The evolution of what is now Exide Technologies began with creation of The Electric Storage Battery Company, founded in 1888 by W.W. Gibbs. As vice president of the United Gas Improvement Company, a Philadelphia gas lighting firm, Gibbs recognized that electricity had great potential as a source for lighting, and as such, posed a threat to gas. Gibbs formed the Electric Storage Battery Company to create a dependable mechanism for storing power so electric lighting companies could provide services to their customers if and when it was necessary.

Realizing that a better storage battery was a necessary first step, Gibbs purchased the ideas and patents of French inventor, Clement Payen, to transform good ideas about storage batteries (then widely referred to as "Pickled Amperes") into thoroughly reliable commercial products. With the development of the storage battery, or the "Chloride Accumulator," the Electric Storage Battery Company brought the electric lighting industry to a new level.

The "Chloride Accumulator"

In 1890, the Electric Storage Battery Company installed the first practical storage battery at the Germantown Electric Lighting Company in Philadelphia. The battery furnished the lighting current, while a dynamo charged the battery. Soon after, the battery company received a request for 13,000 cells to power six new electric streetcars for the Lehigh Avenue Railway Company in Philadelphia. These streetcars became the first self-propelled vehicles to challenge the supremacy of the horse. Throughout the 1890s, the demand for storage batteries increased, forcing the Electric Storage Battery Company to move to larger facilities.

The possibilities for storage batteries continued to grow. The Pullman Company used Chloride Accumulators to light a few of its luxury railroad cars, and small batteries were sold to operate electric fans, sewing machines and phonographs. In 1898, batteries powered the first submarine in the U.S. Just before the turn of the century, Electric Storage Battery

Company batteries were used as power sources in electric locomotives, streetcars, passenger cars, surface boats and telephone exchanges, and for the nation's first automatic switching and signaling systems for railroads.

As the new century dawned, electric taxicabs first appeared in many large cities. They became so popular that The Electric Storage Battery Company developed a product of greater capacity and less weight especially for the "Ply-for-hire" trade. This new battery, introduced in 1900, was the first to bear the trade name "Exide," short for "Excellent Oxide."

Exide in Peace and War

For more than 35 years, Chloride Accumulators enabled electric light and power companies to provide continuous service, while the alternating current systems that serve the public today were being developed and slowly extended. In 1901, the first successful transcontinental telephone service and the first transatlantic "wireless" telegraph transmission used Exide batteries. In the automotive industry, Exide pioneered two major developments concerning two entirely different uses of batteries.

The introduction of the electric carriage as a private passenger vehicle, primarily for town travel, heralded batteries as a means of replacing horsepower. The second development stemmed from a common health problem caused by cars at the time: motorists' broken arms. As a driver hand cranked his engine, the crank often swung back violently, injuring the driver's arm. Efforts to eliminate dangerous engine cranking led to the development of battery-started vehicles. The 1912, Cadillac became the first battery-started car with an internal combustion engine, produced under cooperative development between The Electric Storage Battery Company and Charles F. Kettering. The Exide battery also supplied power for lighting and ignition in this model. The functions of starting, lighting and ignition are the origin of today's battery industry term SLI, referring to automotive batteries.] In 1913, the U.S. Navy began experiments using Exide batteries to start the engines of hydroplanes and, in 1915, Exide batteries were used with the first starters installed on gasoline trucks. Use of the electric passenger car began to decline with invention of the electric starter. With the development of a radically different, heavy-duty battery, the Exide Ironclad, Exide opened up an entirely new field as a source of power. Exide batteries began to be used for the short- haul, frequent "stop and go" operations of electric handling trucks used throughout all of industry. These vehicles were the predecessors of today's delivery vans that might serve only a neighborhood or zip code. Exide Ironclad batteries also were used in electric fork trucks and for the underwater operations of submarines. Over the years, Exide was a part of many major developments in exploration, communications and warfare. In 1934, an Exide deep-cycle battery was the sole source of electrical power when Commander Byrd established a military base on Antarctica. Exide batteries also provided power for Piccard's balloon flight and diesel locomotives that same year.

When the United States entered World War I, Exide engineers developed a lightweight, non- spillable battery to operate thousands of airplane radio sets. The company's batteries also powered many radio stations. In 1938, Exide acquired Grant Storage Battery Company, a move that expanded its product line into battery chargers and testers. Exide also contributed to the war effort of World War II when engineers developed a battery-powered wakeless torpedo.

New Dimensions, New Products

In 1954, the company's lead-acid battery operations were split into two separate divisions - automotive and industrial, so the company could adequately service these different markets. Exide entered the dry-cell battery industry in 1957 when it acquired the Ray-O-Vac Company, then the country's second largest producer of dry-cell batteries.

The following year, Exide opened its Engineering and Development Center in Yardley, PA., as a corporate R&D facility. Exide went on to acquire the Wisconsin Battery Company of Racine, Wis. The renamed Wisco Company added motorcycle and specialty batteries to the growing Exide product line. In 1969, NASA's first lunar landing module used the stored energy of Exide's solar-recharged batteries. NASA took nickel-zinc Exide batteries to the moon on all of the Apollo space missions. During the gasoline crunch of the 1970s, Exide provided batteries for the small, fuel-efficient vehicles that were popular at the time. By 1987, with Exide's acquisition of General Battery Corporation, the company's product line became broad enough to fit nearly every vehicle on U.S. roads.

Modern Innovation and Expansion

The 1980s and 1990s led to increased growth and development for Exide. In 1991 during Operation Desert Storm, Exide supplied starter and tank batteries for the U.S. Army. Exide continues to provide ordnance batteries for the Army today. In 1992, Exide once again demonstrated its powers of innovation with introduction of free electrolyte and gel marine batteries, climate-tailored batteries and maintenance-free technology.

In 1993, Exide initiated European expansion with development of an overseas battery division. In the United Kingdom, Euro-Exide began by acquiring BIG batteries and Gemala Ltd. In Spain, Exide purchased Tudor, and in France CEAC. By 1995, Exide achieved global reach and became the first battery manufacturer to launch a site on the World Wide Web. Robert A. Lutz, former president and vice chairman at Chrysler Corporation, was appointed Exide's Chairman of the Board in 1998. Lutz reorganized the worldwide management structure into Global Business Units and sold off non-battery units to allow the company to concentrate on its primary business. In 1999, Lutz heralded Exide as a high tech, innovative battery company with the introduction of the cylindrically-wound Exide Orbital technology, the most significant technology advancement in lead-acid batteries in 30 years. Exide launched the Orbital into the automotive and specialty markets with the Select Orbital auto battery, and the Orbital marine-starting and deep-cycle batteries.

The Acquisition of GNB Technologies

In 2000, Exide acquired GNB Technologies, the global battery business of Australian-based Pacific Dunlop Limited. The acquisition allowed Exide to reenter the North American industrial battery business, broaden its geographic reach and attain significant efficiencies in its North American transportation business. GNB, a leader in the U.S. and Pacific Rim in manufacturing industrial and transportation batteries, supplied approximately 20 percent of the industrial batteries sold in North America for both motive and network power applications. GNB also was a leading North American supplier of automotive batteries for original equipment manufacturers and aftermarket retailers.

Like Exide, GNB had a rich and colorful history. Three partners – Bertram B. Down, Neil R. McLeod and Edgar A. Reed - founded a company April 9, 1906 in St. Paul, Minn. It was known as the Electric Manufacturing Company.

In that first year, twenty-three-year-old Lytton J. Shields joined the Electric Manufacturing Company and built an extensive regional network of dealers through which he sold Exide batteries, the leading name in batteries at the time. He was so successful that Exide decided to bypass him as distributor and open its own Twin Cities branch. Undaunted, Shields took on the Willard battery line and, through his network of dealers, firmly established the brand regionally. When Willard, too, decided to cut out the middleman, Shields once again was forced to change suppliers. This time, he took on the Philco product line; but again suffered from too much success. In 1916, when Philco notified him that it planned to begin selling direct, it became clear to Shields that if he was to have a future in the battery business, he would have to manufacture his own batteries. Shields initiated action to begin casting grids and making plates, a production process that manufacturers guarded jealously. Thanks to the imagination and ingenuity of Carl Albrecht (who later became chief engineer), the team mastered the art of casting battery grids from molten lead. This gave them a foundation for their own company, called National Battery Company. The company sold its first glass container farm light battery in 1916 and its first automotive starting battery in 1918, under the National Battery brand name. By 1921, Shields realized he needed a national account - a company that would put its own name on his battery and sell it through established, well- accepted outlets. With this business strategy, Shields pioneered the marketing concept of private branding. His first customer was Montgomery Ward. On July 8, 1930, Shields purchased Gould Storage Battery Corporation of Depew, N.Y. With this acquisition, National Battery Company expanded its product line from just smaller, low-capacity automobile, farm lighting and radio batteries to include larger, high-capacity industrial batteries.

Gould supplied standby batteries for electric trolley lines, ocean liner lighting, electric elevators and even the communications wonder known as the "wireless". With much in common, Gould and National came together, pooling technologies, resources -- and names, inspiring the name Gould National Battery. In 1931, National acquired the Champion trademark with the purchase of Englert Manufacturing of Pittsburgh, PA. (Exide Technologies no longer uses the Champion brand).

With battery sales and demands running high, Gould-National diversified by acquiring companies that produced related products to strengthen its position in the automotive industry. During the next 20 years, Gould acquired more than 10 companies. By 1976, when Gould merged with I-T-E Imperial Corporation, it had its first billion-dollar year. In 1989, Gould-National Battery began export of Absolyte II batteries to Nippon Telegraph and Telephone (NTT) of Japan, becoming the first and only U.S. or European company to do so. A year later, the company opened GNB Japan, and in 1994, established GNB China in Hong Kong. GNB scored an award-winning accomplishment in 1996 when the company installed a Battery Energy Storage System (BESS) in the island community of Metlakatla, Alaska, in a partnership with General Electric. The BESS is an installation of lead-acid batteries that smoothes out the uneven hydroelectric current, saves money in energy costs and keeps the community from having to haul fuel oil in a precarious journey from the mainland over rough seas. In its first three years of operation, the BESS saved the local power company more than $1 million. GNB Industrial Power received a prestigious national award for its work on the BESS project.

Exide Technologies Today

Today, Exide Technologies (NASDAQ: XIDE) serves the complex stored energy needs of customers around the globe, providing services and systems that enhance vehicle performance and fleet utilization as well as those that reduce risk of temporary interruptions of power supplies. Key strengths of the Company are that its products and services span global markets and geographic borders, melding two significant bases of experience and technology

Company are that its products and services span global markets and geographic borders, melding two significant bases of experience and technology expertise across its operations. This global footprint promotes better and faster means of introducing innovations in products and services, changing the way the world uses and stores electrical energy.

As a global leader, Exide has operations in more than 80 countries and has 33 manufacturing plants in 11 countries worldwide. Renowned brands including EXIDE®, GNB®, Sonnenschein®, and Absolyte® work to ensure the Company's leading position in global markets.

The Company's four global business groups – Transportation Americas, Transportation Europe and Rest of World, Industrial Energy Americas and Industrial Energy Europe and Rest of World – provide a comprehensive range of stored electrical energy products and services for motive power, network power and transportation applications. The Company's fiscal year 2010 net sales were approximately $2.7 billion.

In November of 2009, Exide introduced ReStore Energy Systems, a new Company division dedicated to the development and pursuit of new markets for renewable energy storage and lithium ion energy systems. ReStore Energy Systems is a global division that utilizes proven technologies in lead-acid energy storage, along with recently acquired lithium ion technology, to develop new application-specific solutions for high-growth, global markets such as renewable energy. Technology- and application-specific collaboration with customers will be a focus of the new division.

The Global Research, Development and Engineering organization at Exide Technologies also is making critical strides and exploring some exciting new dimensions — developing new materials, products and processes to build a solid technology foundation and infrastructure for the future. The team is working on the advancement of multiple technologies — those that may enable breakthrough products or significant new product platforms — for implementation during the next two to five years.

The Company is making a significant investment in upgrading its laboratory and R&D equipment capabilities and continues to build its professional core of qualified engineers and scientists to join its new Product Development centers in Milton, Georgia; Büdingen, Germany; and Aurora, Illinois.

Exide Global RD&E efforts are directed at the utilization of technologies (inclusive of lead- acid) across applications, thereby seeking to maximize efficiencies and accelerate the global growth of new products across multiple product lines and businesses. Overall, the global organization has a strong focus on engineering and product development including those in emerging renewable energy (solar and wind turbines) with large storage applications, coupled with a strategic business fit concerning hybrid electric vehicles (HEVs).

Updated June 2010

1988 (Aug 31) - LA Times article "Gould Was Too Star-Struck for Its Own Good"

See [HN00NM][GDrive]

Looks unsettling. A U.S. electronics and computer company is being purchased by a Japanese giant, Nippon Mining Co., which at $6.5 billion in sales ranks No. 162 on Fortune's list of the world's biggest firms outside the United States.

The last time something like this happened--when Fujitsu Ltd. tried to buy Fairchild Semiconductor in 1987--the U.S. government stepped in to block the deal and prevent the sale of U.S. technology.

But that's not likely to happen in the case of Gould and Nippon Mining. The story on the $1.1-billion deal announced Tuesday is that of a Japanese partner buying out a crippled company that was already liquidating itself piecemeal.

Gould's technology has long been shared with Nippon, an oil refining and minerals company that has been partner to the Chicago-based firm in several ventures. Also, there are signs that Gould's investment bankers have shopped the company around in recent months, with no U.S. takers.

So Nippon gets to pick up the remaining pieces of a company that in the last 20 years has demonstrated both the creativity of a strong and vaulting ego, and also its destructiveness; both a strength and a weakness of U.S. business.

The story of Gould, once Gould National Battery Co., is the story of William Ylvisaker, now retired at 64, a one-time securities analyst who rose through a series of jobs in manufacturing to become the chief executive of Gould in 1969.

Gould then made car batteries, other engine parts and ball bearings. It had less than $500 million in sales, but it made good products and a tidy profit that it rigorously reinvested in its business.

Profits Didn't Come

But Ylvisaker was impatient with mundane products like batteries and ball bearings. He was determined to put Gould into high tech, to make the old company future-oriented and to catch the eye of Wall Street and get the stock price flying. So in the 1970s, he sold many of the older industrial businesses and bought electronics companies. "You've either got to believe or not believe," he declared and drove older hands from the company.

By 1980 he had built Gould into a $2.2-billion sales company and to his credit had added several promising product lines to Gould's traditional electrical lines. But greater profitability failed to follow the buildup in sales. One reason was that Ylvisaker, for all his talk about building for the future, didn't reinvest in the business the way his predecessors had.

And he made mistakes. When Gould came up with an advanced car battery in 1983, Ylvisaker used the development as an opportunity to sell the battery business. Batteries may have been a decent business, but it didn't fit with the image Ylvisaker wished to impart to Wall Street and the public--of a high-tech, glamorous company. As part of the glamour he even made Florida's Palm Beach Polo Club a subsidiary of Gould.

The company became a case study in American industry's bad habits. "American companies look at their businesses as stars and dogs," says Kenichi Ohmae, the management consultant and author who heads the Tokyo office of McKinsey & Co. "And they always want to sell the dogs and keep only the stars. That may be logical, but it lacks a time horizon.

"It doesn't recognize that times and businesses change," says Ohmae. He might have been describing Gould, which failed to recognize new opportunities in batteries and which in the 1980s became a company furiously buying and selling one business after another and talking about restructuring. It declined in sales and suffered losses--$175.7 million in 1985, $95.6 million last year.

But, surprisingly, despite the chaos Gould came up with a few hotshot products. Its copper foil is one of the standard materials for electronic circuit boards, and it has good products in fiber optics and a powerful super-minicomputer.

Nippon Mining has been marketing those products in Japan. Now it will inherit the good businesses worldwide.

Nippon is no slouch technology-wise. Nippon President Yukio Kasahara, like Ylvisaker, saw that his company had to get into future-oriented business. So Nippon invested in advanced metals, and in optics, biotechnology and electronics. It already owns a titanium company in Michigan and a couple of small high-tech companies in California.

But Nippon didn't forsake its base in metals or petroleum refining. Kasahara hasn't sold old businesses to buy new ones. Rather, he has added businesses and invested in them. Thus, Nippon has grown as Gould has withered. Kasahara hasn't let ego stand in the way of common sense.

[HW001T][GDrive]

Gould Inc.

The **National Battery Company** (NBC), incorporated in 1928, acquires control of the **Gould Storage Battery Company** in 1930. After that, the latter operates as a subsidiary under the name **Gould Storage Battery Corporation**. NBC purchases **the storage battery division of the Philco Corporation** in 1947. Three jaars later, NBC changes its name into **Gould-National Batteries, Inc**. (GNB).

In 1969, GNB merges with the **Clevite Corporation**, a manufacturer of precision automotive parts, marine electronics and batteries. The new entity results in **Gould, Inc.,** and engages more in digital electronics and computer peripherals. After the acquisition of **Systems Engineering Laboratories**, a manufacturer of minicomputers, Gould becomes a supplier of mini- and superminicomputers including CAD/CAM turnkey computer systems.

1970s

- 1971 Gould wins a $1.5 billion U.S. Navy procurement contract for the computerized Mark 48 torpedo.
- 1973 Introduces the **Gould 700 line of computer-output microfilm (COM) recorders**. In 1975 compatible **Gould Beta COM** systems include a disk file, a stroke character generator, modular software, and an operator console.
- 1974 The Gould Plotmaster System, an off- and online electrostatic printer/plotter system, is introduced.
- 1975 3M Company acquires Gould's Graphic Systems Division which produced the computer-output microfilm (COM) recorders.
- 1975 The company announces the Gould 6000 analog to digital data logger-reader and one year later the Gould 6100 data logger-reader. These systems collects, digitizes and stores low-frequency data on magnetic tape for subsequent processing e.g. by one of Gould's printer/plotter systems.
- 1977 Gould introduces a **remote graphics processor (RGP)** that gives remote terminals the capability of generating hard copy when coupled with a Gould 5000 Series electrostatic printer/plotter.
- 1977 Gould acquires **Modicon Corporation**, a pioneer in PLC's (programmable logic controllers)
- 1979 Gould does not succeed in acquiring the Fairchild Camera and Instrument Corporation and the Mostek Corporation. As a result Fairchild was acquired by Schlumberger Ltd and Mostek by the United Technologies Corporation.

1980s

- 1981 Gould acquires Systems Engineering Laboratories which continues to operate as the Gould Computer Systems Division.
- 1981 Gould acquires American Microsystems, Inc., a maker of custom semiconductors.
- 1983 A pair of **Gould SEL 32/8780** digital minicomputers are used in **SAIL (Shuttle Avionics Integration Laboratory** simulator environment). Other SEL computers are used for digital autopilot simulation, solving equations of motion, radar altimeter, and other nonavionics functions.
- 1984 Gould's Computer Systems Division launches the **PN9000 series of super-minicomputers** running on UNIX
- 1984 Gould introduces the **CONCEPT/32 family of real-time 32-bit minicomputers**. The systems run on Gould's Process Automation and Control Executive, PACE/32, a menu-driven software system which allows engineers to implement process automation strategies without programming.
- 1984 The 32-bit **PowerNode 6000 runs on Gould's UTX/32** (Universal Time-sharing Executive) operating system, a compatible multiprocessor extension of the Unix operating system consisting of AT&T System V and Berkeley BSD environments. The system comes with the Gould Selbus, which offers a data transfer rate of 26.7 Mb/sec.
- 1984 Gould enters the **CAD/CAM** marketplace as a turnkey supplier with the introduction of the **PowerStation 3100 and 5100**. These two standalone workstations for mechanical CAD/CAM applications are UNIX-based and use a software package from Vulcan Software under a software license agreement.
- 1985 One of Gould's primary contributions to the real-time computing world was its "**Reflective Memory**" technology which allowed up to eight computers to share distributed memory at a high speed.
- 1986 Introduces the **PowerNode 9000 32-bit computer systems**. An optional 32-bit Internal Processing Unit, a duplicate of the CPU, can be added to the system to improve computational throughput. Up to 16MB of main memory can be optimized with up to 64KB of cache memory per processor.
- 1987 Introduces the **NPL family of mini-supercomputers** for computationally intensive engineering applications. The NP1, the first series of the new family, has an open systems architecture, including parallel and high-speed vector processing, and massive memory. The NP1 models range in price from $395,000 to $2.9 million. The largest system, the Model 480, has up to four billion bytes of physical memory.
- 1987 Acquired by **Nippon Mining and Metals**
- 1989 Sells its computer division to **Encore Computer Corporation** and its **Modicon** division to AEG.

2003 book - "Stuart Symington : A Life " by James Olson - Pages 17 and 18

See [HB000H][GDrive]

NOTE - "Uncle Charlie" is Charles Julian Symington (born 1883) .

As might be expected, his family came to the rescue. Uncle Tom, who had given Stuart his first job in Rochester, was at work in Baltimore developing new products for the railroad industry and thought Stuart might be of some help in the business. So Stuart and Eve sold their house in Rochester, packed up Baby Ttm, and moved into "a weird little apartment in Baltimore," part of the Garden Apartments on University Avenue, bordering on the exclusive Roland Park neighborhood where Stuart lived for a time while growing up. 3 "Eve was completely understanding and loyal, which bolstered me plenty," Symington later wrote.

The young couple did not remain long in Baltimore. Through the works manager at the Rochester plant, who was more of a friend than the vice president had been, Stuart got word of a company in Rochester that made sewer pipe and clay conduit for telephone lines which was about to go into receivership.

The company owned a bed of clay in Pennsylvania that the works manager said would be excellent for producing the molding sand used in the manufacture of iron and steel castings. Stuart, who apparently had ready access through his uncles to large sums of money, persuaded Uncle Tom that the clay bed would be a good investment, and early in 1926 he went to Rochester with a certified check for three hundred thousand dollars to bid on the property. While in Rochester he met an oil man from Pennsylvania, Vernon Taylor, who also was interested in the property. Taylor suggested that they form a partnership and buy the land together.

This was satisfactory with Tom, who joined in the establishment of the Eastern Clay Products Company, with Stuart as president. The company sold clay products to large foundries all over the country, and during the first year made a profit of 40 percent. Clearly, young Stuart knew how to run a company.

Uncle Charlie asked him to return to Rochester as his executive assistant (His uncles for some years had assumed a familial responsibility for his well-being, and with the rather sudden death of his father on February 19 1926, that sense of responsibility increased. They were learmng, however, that in young Stuart they had a man who could run a _busmes~ and make money on his own. He would come to them for help from time to time, but he surely did not need to be taken care of.) Charlie's company had expanded rapidly, purchasing the ***Gould Coupler Company*** *in Buffalo and its subsidiaries, the* ***Gould Storage Battery Company*** *and the* ***Gould Car Lighting Corporation****. The entire operation they renamed* ***Symington-Gould****.*

So it was back to Rochester. Stuart kept his interests in the Eastern Clay Products Company, arranging with Taylor for someone else to serve as president. The young family moved into a house on fashionable East Avenue in the Brighton section of Rochester, "one of Rochester's proudest addresses. "5 While living there, a second son, James Wadsworth Symington, was born.

The family didn't stay long in Rochester. Stuart's uncles offered him the presidency of the battery company in Buffalo. After thinking about it for a while, he turned them down, saying that he knew nothing about selling batteries, but was confident he could manufacture them. He suggested that they make him operating vice president. They agreed, and the family moved to Buffalo, taking up residency in a new high-rise apartment on Park Circle.6

In a short time, however, Stuart found himself at odds with the newly appointed president of the company, a likable person who apparently found it difficult to make tough decisions. Stuart's efforts to clean up the operation ran afoul of some of the senior executives, who understandably took umbrage at having a twenty-six-year-old boy tell them how to run their business. Two of them threatened to quit unless Stuart resigned, and the president told Stuart that he had no choice but to support chem. ***Stuart went down to Baltimore to talk to his Uncle Donald, president of the Baltimore Trust Company and a major investor in Symington-Gould. He suggested chat the brothers get rid of the battery company's management and make him president, assuring his uncle that he had become convinced he could handle selling as well as manufacturing.***

Uncle Donald replied that they couldn't do chat, but told Stuart he could have a position in a company in Baltimore in which the uncle had an interest. Stuart countered by suggesting that the uncles let him use a building in Rochester, which was being vacated because they were selling the car lighting business, to manufacture radio parts. They agreed, and set up a new company called Valley Appliances, Inc., with Stuart as president.?

Joseph Peter Grace (born 1913)

Wikipedia J. Peter Grace

[HK0019][GDrive]

Joseph Peter Grace (**May 25, 1913** – April 19, 1995) was an American industrialist. He was president of the diversified chemical company **W. R. Grace and Company** for 48 years.

1913 (May) - Born Manhasset, New York

Joseph Peter Grace was born in Manhasset on May 25, 1913. When he was born, his family was already very wealthy.

His father was **Joseph Peter Grace, Sr. (1872–1950)** (see wikipedia - https://en.wikipedia.org/wiki/Joseph_Peter_Grace,_Sr.).

*"[Even though Peter was born into a wealthy family], after being educated at St. Paul's School in Concord, N.H., and at **Yale**, where he lettered in three sports, in 1936 the 23-year-old took a job in the W. R. Grace mailroom.*

During his early years with the company, Mr. Grace had the chance to indulge his passion for athletics.

A world-class polo player, in the winters he played goalie at night for the St. Nick's semiprofessional hockey team in New York." [aa2]

1941 - Married Margaret Fennelly

He married Margaret Fennelly in 1941, and the couple remained together until his death.

1945 - President and CEO of W. R. Grace and Company

[He] succeeded his father, **Joseph Peter Grace, Sr. (1872–1950)** (see wikipedia - https://en.wikipedia.org/wiki/Joseph_Peter_Grace,_Sr.) as President and CEO of **W. R. Grace and Company** in 1945 when his father suffered a stroke. **W. R. Grace and Company** in was founded by his grandfather William R. Grace, the first Roman Catholic to be elected Mayor of New York City. "His maternal grandfather was Charles B. Macdonald, a major figure in early American golf who built the first 18-hole course in the United States."

Personal life

Grace was the kind of man who, at age seventy, Indian-wrestled fellow chairmen of the board at his desk, showered in the evening to save time getting to work in the morning, wore a Beretta pistol (for terrorists), and, as a conservative Democrat, took out a full-page ad in *The New York Times* to support President Ronald Reagan's tax cuts.

[...]

Politics

In the Oval Office in 1984

In the Kennedy administration, J. Peter Grace was head of the Commerce Department Committee on the Alliance for Progress. President Reagan, in announcing the selection of J. Peter Grace to lead The Grace Commission on waste and inefficiency in the Federal government, said:

> We have a problem that's been 40 years in the making, and we have to find ways to solve it. And I didn't want to ruin your appetites, so I waited till now to tell you this, but during the hour we're together here eating and talking, the Government has spent $83 million. And by the way, that includes the price of your lunch. [Laughter] Milton Friedman is right. There really is no such thing as a free lunch. The interest on our debt for the last hour was about $10 million of that.
>
> In selecting your Committee, we didn't care whether you were Democrats or Republicans. Starting with Peter Grace, we just wanted to get the very best people we could find, and I think we were successful.
>
> I'll repeat to you today what I said a week ago when I announced Peter's appointment: Be bold. We want your team to work like tireless bloodhounds. Don't leave any stone unturned in your search to root out inefficiency.

Mr. Grace, a Democrat, was asked what he would say to the campaign theme of Walter Mondale, the 1984 Democratic Presidential candidate, that higher taxes would be required to ease the deficit regardless of who wins the November election.

"I'd tell him he's nuts," Grace said. "He's wrong. He's wrong."

Awards and memberships

In 1967, he was awarded the Laetare Medal by the University of Notre Dame. In 1984, Mr. Grace received The Hundred Year Association of New York's Gold Medal Award "in recognition of outstanding contributions to the City of New York." That year he also received the S. Roger Horchow Award for Greatest Public Service by a Private Citizen, an award given out annually by Jefferson Awards. Grace was a leader in the American Association of the Sovereign Military Order of Malta. Grace was a member of the conservative American organization the Council for National Policy. He was responsible for the, and co-founded "Citizens Against Government Waste" with Jack Anderson in 1984.

1995 (April 21) - Passing

OBITUARIES

J. Peter Grace

William Scott, 46; Led AIDS Groups

William Arnold Scott, who founded organizations aimed at increasing awareness of gay and lesbian concerns in Houston and became a nationalfigure on AIDS issues, died on April 4 at Park Plaza Hospital in Houston. He was 46 and lived in Houstn.

The cause was complications from AIDS, said a spokesman for the Texas Board of Health, which oversees programs and policies of the Texas Department of Health. Mr. Scott had been a member of the board since 1988.

Mr. Scott was a past president of the National Lesbian and Gay Health Foundation. In Houston, he founded counseling services and support groups that aided men with the AIDS virus and was a co-founder of the AIDS Foundation of Houston.

Mr. Scott was born in Bay Shore, L.I., and received an undergraduate degree from Mercy College and a master's degree in social work from the State University of New York at Albany. He had a private practice as a social worker and psychotherapist in Houston.

He is survived by his companion, Jose Rodriguez of Houston; his mother, Stella Martha Scott of Haverstraw, N.Y., and three brothers, Almos, of Wilmington, N.Y., Joseph, of Stny Point, N.Y., and Lawrence, of Charlotte, N.C.

Books of The Times

J. Peter Grace, Ex-Company Chief, Dies at 81

By KENNETH N. GILPIN

J. Peter Grace, the outspoken and at times controversial industrialist who headed a major American company longer than any other chief executive, died of cancer on Wednesday at St. Vincent's Hospital in Manhattan after a long illness. He was 81 and lived in Manhasset, L.I.

Although his company, W. R. Grace, always came first, Mr. Grace was extraordinarily active in public and religious circles, and in his younger days was a star athlete.

A leading layman of the Roman Catholic Church, Mr. Grace became widely known to the public from 1982 to 1984 for his service as head of President Ronald Reagan's Private Sector Study on Cost Control in the Federal Government, which came to be known as the Grace Commission.

In that role, Mr. Grace, a longtime critic of what he regarded as profligate Government spending, directed a group of about 2,000 business executives to come up with ways to root out waste and inefficiency in the Federal Government.

"I have 9 children, 12 grandchildren, and I'm concerned about their freedom," Mr. Grace said in a 1983 interview. "We've got to get this growth rate and the outlays down. It can't go on this way. If this deficit goes to $1 trillion a year, our freedoms are gone."

While his views on the evils of the Federal deficit have gained currency over time, from time to time Mr. Grace's actions and opinions on other matters generated a furor.

There was a severe public reaction, for instance, when W. R. Grace admitted that in the early 1950's that it employed as a consultant a German chemist who was convicted in the Nuremburg war-crimes tribunal. And Mr. Grace unleashed a firestorm of protest after a 1982 speech in Dallas when he commented that the Federal food stamp program was basically a subsidy for Puerto Ricans. He subsequently apologized.

Despite his widespread interests, the company that bore his family name was Mr. Grace's enduring passion. For 47 years, Mr. Grace ran W. R. Grace & Company, a $5 billion specialty chemicals and specialized health-care company that his grandfather, William R. Grace, founded in Peru in 1854 as a shipping and trading company. And even when he agreed, reluctantly, to step aside in 1992, he remained an active force as chairman of the company's board.

"I have none," he said.

Even as his health deteriorated this spring, Mr. Grace fought tenaciously but unsuccessfully to retain control of the company that for more than 140 years always had a member of his family at the top.

Following the sudden resignation on March 2 of J. P. Bolduc, the man who succeeded him, Mr. Grace and his company were confronted by a group of disgruntled shareholders demanding sweeping changes in the structure and composition of W. R. Grace's board of directors.

Included in those demands was a requirement that Mr. Grace and a group of longstanding friends and business associates not stand for reelection to the board at the company's annual meeting on May 11.

In late March, the company said it would comply with the shareholder

The man who ran W. R. Grace for 47 years stepped aside reluctantly in 1992.

demands, but the board did not formally meet to consider the changes until April 6.

At that meeting, in the W. R. Grace Building in midtown Manhattan, a gravely ill Mr. Grace spoke against the changes, which he called "offensive," and urged the board to resist their being put into effect.

His stand was completely in character. A short man who spoke with a slight lisp, Mr. Grace once told a reporter: "I am never discouraged. When you get discouraged you ought to pack it in."

The board did not agree, and the measures were approved. Although he would have stayed on as honorary chairman, Peter Grace's 59-year career at W. R. Grace was over.

It was a career circumstances did not require he pursue.

When Joseph Peter Grace was born in Manhasset on May 25, 1913, the family was already wealthy. Young Peter grew up with all the creature comforts and the virtual certainty they would be his for life.

Yet, after being educated at St. Paul's School in Concord, N.H., and at Yale, where he lettered in three sports, in 1936 the 23-year-old took a

to indulge his passion for athletics.

A world-class polo player, in the winters he played goalie at night for the St. Nick's semiprofessional hockey team in New York.

When his father, Joseph P. Grace, suffered a stroke in 1945, Mr. Grace took over as president and chief executive. During his tenure, Peter Grace engineered and oversaw two separate transformations of the company he inherited.

From what was originally a Latin American trading, shipping and banking company, he remade the company in the 1950's and 60's into a conglomerate with interests from chemicals to consumer goods.

But by the mid-1980's, it was clear that W. R. Grace was in too many businesses. And Mr. Grace recruited Mr. Bolduc, his top aide on the Grace Commission, to revamp the company again. Today, W. R. Grace is the world's largest specialty chemical company and a leader in specialized health care.

Deeply religious throughout his life, Mr. Grace was a founding member of Legatus, an international organization of Catholic chief executives whose mission is to study, live and spread the faith in their professional and personal lives.

He was also president of the Catholic Youth Organization of the Archdiocese of New York. In 1967, the University of Notre Dame awarded him the Laetare Medal, the highest Catholic honor in the United States.

Over his life, he served on eight different corporate boards, including Citicorp and Citibank, N.A.

He was also active in a number of charitable interests, especially those whose activities focused on New York City's disadvantaged youths, a group that includes the Grace Institute, Covenant House and the Inner City Scholarship Fund.

Mr. Grace is survived by his wife, the former Margaret Fennelly, whom he married in 1941; nine children, J. Peter Grace 3d of Locust Valley, L.I., Dr. William R. Grace of Plandome, N.Y., Michael S. Grace of Far Hills, N.J., Margaret Mary Grace-Shethar of Colorado Springs, Colo., Mary J. Grace of Manhattan, Nora M. O'Donnell of Delray Beach, Fla., Patrick P. Grace of Greenville, S.C., Theresa M. Sears of Manhasset, and Christopher G. Grace of Boca Raton, Fla.; one brother, Charles M. Grace of Santa Monica, Calif.; a sister, Janet M. Grace of Old Westbury, L.I., and 20 grandchildren.

W. R. Grace and Company

Wikipedia W. R. Grace and Company

"W. R. Grace and Company is an American chemical conglomerate based in Columbia, Maryland. Grace is divided into two business segments: Grace Catalysts Technologies and Grace Materials Technologies. [For most of its history, Grace's main business was cargo shipping.] Grace is a specialty chemicals and specialty materials company. As of December 31, 2017, it has approximately 3,700 employees, with about 1,900 in the United States and 1,000 in Germany. In 2017, the annual sales is US $ 1.72 billion." [HK0007][GDrive]

"The company has its headquarters in Columbia, an unincorporated census-designated place in Howard County, Maryland." [HK0007][GDrive]

History [1854-1900]

William Russell Grace

"W. R. Grace and Company was founded in 1854, in Peru, by William Russell Grace [HK0008], who left Ireland due to the potato famine, and traveled to South America with his father and family. He went first to Peru to work as a ship's chandler for the firm of Bryce and Company to the merchantmen harvesting guano (bird droppings), used as a fertilizer and gunpowder ingredient due to its high levels of phosphorus and nitrogen" [HK0007][GDrive]

"His brother Michael Paul Grace [HK0009] joined the business and in 1865 the company name was changed to Grace Brothers & Co. The company set up head office operations in New York in 1865. Working in fertilizer and machinery, the company was formally chartered in 1872, and incorporated in 1895." [HK0007][GDrive]

Early shipping business / "Grace Line" / "New York & Pacific Steamship Co." [Pre-1900]

"For most of its history, Grace's main business was cargo shipping. To get cargo from Peru to North America and Europe, including guano and sugar, and noticing the need for other goods to be traded, William Grace founded a shipping division. Grace Line began service in 1882, with ports of call between Peru and New York. Regular steamship service was established in 1893, with a subsidiary called the New York & Pacific Steamship Co., that operated under the British flag." [HK0007][GDrive]

Incorporation

"There are two accounts of the incorporation date of W. R. Grace & Co. According to a New York Times account the company was incorporated, as part of estate and successor planning, in 1895. The three brothers consolidated most of their holdings into a new private company, incorporated in West Virginia, called W. R. Grace & Company. The consolidation involved W. R. Grace & Co. of New York, Grace Brothers & Co. of Lima, Peru, Grace & Co. of Valparaiso Chile, William R. Grace & Co. of London, and J. W. Grace & Co of San Francisco." [HK0007][GDrive]

"According to its website, W. R. Grace & Co. was incorporated in Connecticut in 1899. The listed capital of $6 million did not include Grace Brothers & Co. Limited in London or its branches in San Francisco, Lima and Callao, Peru, nor in Valparaiso, Santiago, and Concepción, Chile." [HK0007][GDrive]

"J. Louis Schaefer, who joined the company as a boy, would play a key role in not only W. R. Grace & Company, in which he became a vice president, but also as president of Grace National Bank [HK000A]. Schaefer would be a co-executor of the estate of Michael Grace with William's son and corporate successor, Joseph Peter Grace, Sr. [HK000B]. J. Louis Schaefer died in 1927." [HK0007][GDrive]

History [1900 - 1949]

1945 - J. Peter Grace Jr. assumes management

2019-04-28-wikipedia-j-peter-grace-img1.jpg /
https://drive.google.com/open?
id=12BV4uYF8xcQMv2NtbvOl8s3pWKdYzmvx

Joseph Peter Grace, Jr. (born 1913), took over management of the company after his father *Joseph Peter Grace, Sr. [HK000B]* suffered a stroke in 1945.

Shipping

"US-flag service began in 1912 with the Atlantic and Pacific Steamship Company. The activities of both companies and the parent firm were consolidated into the Grace Steamship Company beginning in 1916. The firm originally specialized in traffic to the west coast of South America; then later expanded into the Caribbean" [HK0007][GDrive]

"In 1916, Grace acquired a controlling interest in the Pacific Mail Steamship Company. In 1921, Pacific received five 535 ft. President class ships from the United States Shipping Board [United States Shipping Board] for transpacific operation. In 1923, the US Shipping board decided to place the five ships up for bid and Dollar Shipping Company [American President Lines#Dollar Shipping Company] won the bid. With no large ships for the transpacific operations Grace sold the Pacific Mail, its registered name, and goodwill to Dollar. Now without a transpacific service, Grace did not need the six intercoastal freighters and sold them off to the American-Hawaiian Steamship Company [HK000D]. At this time Grace formed a new entity, the Panama Mail Steamship Company, to operate the smaller ships that were formerly owned and used by the Pacific Mail in the Central American trade. These ships were not involved in the sale to Dollar." [HK0007][GDrive]

"On the death of William R. Grace in 1904, he was succeeded by William L. Sauders as company President followed by Joseph Peter Grace, Sr. [HK000B] who became president in 1907. In 1938 the Colombian Line merged with Grace Line bringing an end to the Colombian Line. During World War II, Grace Lines operated numerous transports for the U.S. War Shipping Administration." [HK0007][GDrive]

"J. Peter Grace, Jr. took over management of the company after his father suffered a stroke in 1945. After [World War 2] war the Grace line operated 23 ships totaling 188,000 gross tons, and an additional 14 more on bareboat charters." [HK0007][GDrive]

Grace Line WWII poster

Airline - Panagra

*"In 1928, Grace and Pan American Airways jointly formed Pan American-Grace Airways [HK000C] known as **Panagra**, establishing the first air link between the North and South America, that began operation in 1929."* [HK0007][GDrive]

History [1950-1999]

1953- Going public on NY Stock Exchange

"Grace listed on New York Stock Exchange with ticker GRA in 1953." [HK0007][GDrive]

1950s (early) - W. R. Grace Company employs Otto Ambros (German chemist convicted in Nuremburg Trials) as a Consultant

"W. R. Grace admitted that in the early 1950's that it employed as a consultant a German chemist who was convicted in the Nuremburg war-crimes tribunal". [nytimes article]

The scientist was **Otto Ambros** (born 1901) .

See **Joseph Peter Grace, Jr.** (born 1913) .

1954- Acquisition of Davision and Dewey & Almy

"In 1954, Grace acquired **Davison Chemical Company** and Dewey & Almy Chemical Company, establishing the basis for a few key product lines." [HK0007][GDrive]

1966-1969 - Purchase/Sale of stake in Miller Brewing Company

"The company bought a 53% stake in Miller Brewing in 1966, for $36 million; Lorraine Mulberger sold the stake for religious reasons. It sold the Miller stake in 1969 to Philip Morris for $130 million, topping a deal with PepsiCo for $120 million." [HK0007][GDrive]

1965 - Hired Dora K Crawford - Who deciphered messages in WW2 that had been encoded by Germany's Enigma machine

See [HN017X][GDrive]

The daughter of Matthew Pyne, a former Baltimore Sun Linotype operator, and Frances Corderoy Pyne, a homemaker, the former Dora Kathleen Pyne was born and raised in Ilford, Essex, a municipal borough of London.

She attended Mulley's Commercial College and with the outbreak of World War II, volunteered with the Women's Royal Naval Service.

"Then only in her teens, she was based at one of the Bletchley Park outstations, where she joined the band of women who, sworn to secrecy, used Colossus, also known as Eniac, the world's first electronic computer, to decipher messages encoded by the Enigma encryption technology used by the Nazi military," said a son, Brian D. Crawford of Arlington, Va

Mrs. Crawford, who was one of a handful of surviving code breakers, received a commendation in 2009 from Queen Elizabeth II on the 70th anniversary of when Alan Turing and his colleagues first arrived at Bletchley Park in 1939. Mr. Turing was the subject of the Hollywood movie "The Imitation Game" last year.

While Mrs. Crawford knew of Mr. Turning, she was much closer to Thomas Harold "Tommy" Flowers, an electrical engineer who designed the computer, which he named Colossus, that was used to break the German code.

In 1965, after her children reached school age, Mrs. Crawford took a job with W.R. Grace Inc. at its chemical research facility in Clarksville, and subsequently became an executive administrative assistant in the office of the president of the company's Davison Chemical Co. in downtown Baltimore.

1971 - Commissions W R Grace Building in Manhattan (NYC)

"Although W. R. Grace commissioned the Grace Building in New York City, built in 1971, the company no longer has any offices at that location."

See WIKIPEDIA - https://en.wikipedia.org/wiki/W._R._Grace_Building

1980s - Operations in China

"In 1987, by buying a can sealing plant in Shanghai, Grace became the first wholly foreign-owned company to do business in The People's Republic of China." [HK0007][GDrive]

1999 - Headquarters moved from Florida to Columbia, Maryland

"Previously the company had its headquarters in Boca Raton, Florida. Prior to its closing, the Boca Raton headquarters had about 130 employees. On January 27, 1999 it announced it was moving its administrative staff to the Columbia office and closing the Boca Raton headquarters. About 40 of the employees went to Columbia, and some employees went to Cambridge, Massachusetts.] In 2014, the company emerged from a 13-year bankruptcy case stemming from asbestos claims, and immediately built a new 90,000 sq ft headquarters building on its 160-acre Columbia campus." [HK0007][GDrive]

1958-1980s Curtis Bay and Thorium extraction / Curtis Bay, Maryland

"The W.R. Grace and Company is located on an industrialized peninsula in south Baltimore, Maryland. In the 1950's the W.R. Grace and Company milled thorium for the Atomic Energy Commission (AEC), a predecessor agency for the US Department of Energy. W.R. Grace began processing radioactive materials at the site in the 1950s, when Rare Earths, Inc. (W.R. Grace's predecessor) entered into a contract with AEC to extract thorium and rare earths from naturally-occurring monazite sands. Rare Earths' contract with AEC and its license to possess, transfer and use radioactive thorium were transferred to W.R. Grace and Company. Building 23, where the thorium processing took place, was open until the late 1950s when the contract was terminated. The wastes were buried in a landfill area. Thorium processing resulted in low-level waste that was buried on the property. Radiation surveys have shown that radioactive contamination still persists in the waste burial area, the waste management area which surrounds the waste burial plot, surfaces surrounding vats and hoppers in Building 23 and alpha-radiation surface contamination in the whole of Building 23. The site was designated by DOE for remedial action under the Formerly Utilized Sites Remedial Action Program (FUSRAP) in 1984. This site was one of the 21 FUSRAP sites where cleanup responsibility was transferred to the US Army Corps of Engineers in 1997 in accordance with the Energy and Water Development Appropriations Act for FY 1998. Cleanup responsibilities transferred at that time from DOE-EM to the USACE." [HW000C][GDrive]

Source for below : *2015-01-maryland-dept-env-wr-grace-davison-chem.pdf / https://drive.google.com/open?id=10E_igra6YUbkBYI4rUPekHT7DWkFj13k*

This site is located at 5500 Chemical Road in Baltimore City, on a peninsula between Curtis Creek and Curtis Bay. The site has been involved in the production of agricultural and industrial chemicals since 1910. During WWII, the site was involved in the Manhattan Project.

The W.R. Grace / Grace Davison Chemical Division, Curtis Bay Facility is located on an industrialized peninsula in South Baltimore, and consists of 260 acres owned by W.R. Grace. The property is bordered on the north by Curtis Bay, on the west by Curtis Creek, on the east by the Patapsco River, and on the south by the Baltimore City Municipal Landfill.

Site History

There were both active and inactive waste disposal areas on-site. There is an inactive waste disposal area that was used to dispose of industrial, process and construction waste. There is also an inactive radiation disposal area. This area was used to dispose of waste from a pilot plant process in the 1960s. Currently in use is the wastewater plant sludge cell. Wastewater from the Waste Water Treatment Plant is directed to Herring Pond and the sludge is sent to a wastewater plant sludge cell. There is an NPDES outfall which extends from Herring Pond to Curtis Bay.

At one point, there was approximately 704,000 cubic feet of radioactive waste that had been disposed of in the radioactive waste disposal area. In 1992, an official from MDE's Division of Radiological Health stated the site had been remediated to an acceptable point for any type of use.

Chemical processing has been performed at the Grace site since 1909. In the early 1940's, Grace produced agricultural fertilizers and industrial chemicals. During World War II, the facility manufactured explosives and participated in Manhattan Engineer District activities. In 1955, Rare Earths, Inc., the predecessor of Grace, entered into a contract with the Atomic Energy Commission to extract radioactive thorium and other rare earth elements from monazite sand that was shipped to the Curtis Bay plant; the thorium processing was terminated at the Grace site in 1956. From 1912 until 1979, all waste material generated at the plant was disposed of in areas to the east of the plant proper.

1957 - New company called Nuclear Fuel Services Inc. (NFS) is created and Baltimore with financial backing from W. R. Grace / Davison Chemical

Nuclear Fuel Services Inc. was born in 1957 in Baltimore when **T.C. Runion**, **Charlie Taylor**, **Stan Reese** and **Ed Johnson**. "[The] the four men were working for National Lead Co. in Fernald, Ohio, when their lives intersected." [HN002C][GDrive]

In the 1950s, there was a "desire by Congress to have commercial nuclear power plants". [HN002C][GDrive]

""We knew that W.R. Grace [and Company] was wanting to grow into the nuclear business and that Davison Chemical Company made a lot of specialty chemicals, so we went to them for financial backing," [NFS Inc. founder Ed Johnson] said." [HN002C][GDrive]

"The Davison Chemical Company, a division of W.R. Grace, began processing radioactive materials in the late 1950s at the site of the current Nuclear Fuel Services (NFS) facility near Erwin, Tennessee (NFS 2005)." [HX0001][GDrive]

"The Report to Joint Committee on Atomic Energy Congress of the United States by the United States General Accounting Office (GAO 1967, p.5-6) from September 14, 1967, states: "AEC authorized the Davison Chemical Division of W.R. Grace & Company (Grace) to receive and process special nuclear material under license number SNM-124. Grace received its first material as an AEC licensee by lease agreement in March 1958 and its first nuclear material as an AEC contractor in May 1959." " [HX0001][GDrive]

"The Davison Chemical Co. was sufficiently encouraged by the developments in the late 1950's to consider the feasibility of constructing a reprocessing facility. In 1961, Davison expressed interest in operating the WNYNSC. January 1962, Davison outlined its plans to the AEC for constructing a In private reprocessing plant. To pursue the reprocessing venture, Davison set up Nuclear Fuel Services, Inc. (NFS), whose stock was owned by the W. R. Grace Co. (78%) and American Machine and Foundry (22%)." [HG0003][GDrive] This merger was formed in 1964. [HX0001][GDrive]

" In 1965, the UO 2 /PuO 2 MOX facility was completed, and in 1968, the light-water breeder reactor thorium, thoria, and 233 U oxide program was initiated (NFS 2005). Ownership of NFS transitioned from Getty Oil to Texaco as part of a stock buyout of Getty Oil in 1969. In 1987, NFS Services, a private Atlanta-based limited partnership, purchased NFS from Texaco. Figure 2-1 shows the location of Erwin, Tennessee. Figure 2-2 shows the principal site infrastructure for the NFS facility in 1986 (Congress 1986, p.108)." [HX0002][GDrive]

"Regulatory authority over operations was originally under the AEC (1954 to 1974) and changed to the U.S. Nuclear Regulatory Commission (NRC) (1975 to present) under Special Nuclear Material License SNM-124, as amended." [HX0002][GDrive]

See [HN002C][GDrive]

*The choice of building NFS in Erwin was a matter of logic and personal feelings. [**T.C. Runion**] said the town was close to Oak Ridge and Savannah River, a Department of Energy site close to Aiken, S.C., and a railroad siding could be obtained for the Erwin property. Plus, Erwin was his hometown.*

Taylor said the early years consisted of processing highly enriched uranium, low-enriched uranium and thorium metal. During down times, NFS made specialty chemicals. Later, NFS manufactured material for Consolidated Edison's first commercial nuclear reactor.

The company's most well-known role with the military evolved from the Navy's wishes to have a fleet of nuclear powered ships. NFS has been the sole provider of Navy fuel since 1966, and the first batch arrived at an aircraft carrier in 1969.

*"We wanted to penetrate the Navy business, so NFS and **W.R. Grace** went to work on a better type of fuel completely on our own and without government support," Johnson said. "It was a really gutsy thing to do." [...]*

He said NFS was one of the first plants to produce uranium oxide as part of the fuel that nuclear power electric generating plants needed. The material used in Erwin was manufactured at a government plant in Oak Ridge, Runion said.

Shipping

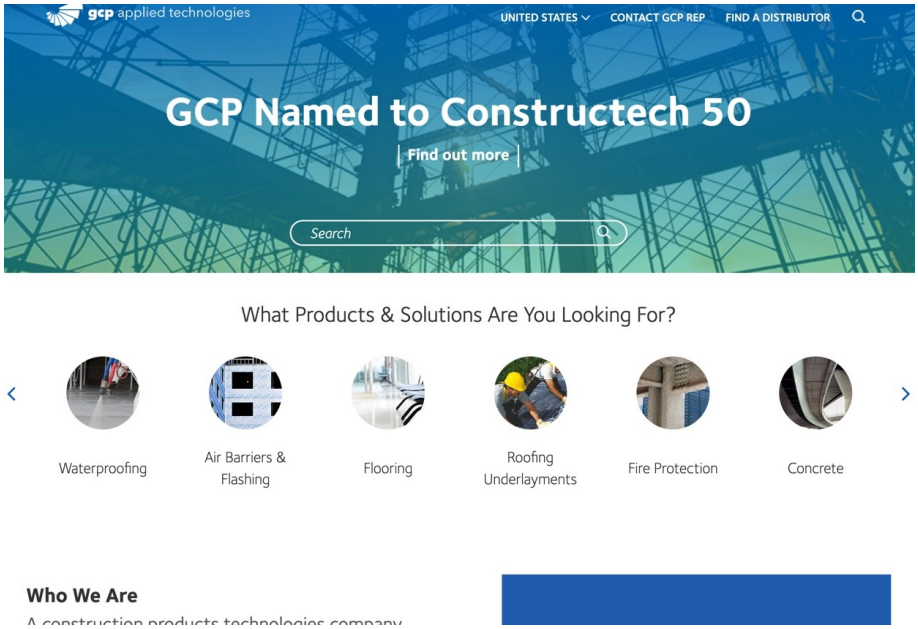
"In 1960 Grace Line, inspired by the pioneering efforts of Sea-Land Service, Matson Navigation, and Seatrain Lines, sought to begin containerizing its South American cargo operations by converting the conventional freighters Santa Eliana and Santa Leonor into fully cellular container ships. However, the effort was stymied by the opposition of longshoremen in New York and Venezuela and the ships were repeatedly laid up idle and were ultimately sold to the domestic container line Sea-Land Service in 1964. In 1963 Grace made a second attempt to containerize its South American trade when it ordered the four M-class combination passenger-cargo ships Santa Magdalaena, Santa Maria, Santa Mariana and Santa Mercedes with partial cellular holds, but they were no more successful as mixing conventional break-bulk cargo and containers in the same ship negated the operating economies that full containerization promised." [HK0007][GDrive]

"In 1969 Grace decided to exit the shipping business to concentrate on its chemical and diversification ventures. Grace Line was sold and merged into Prudential Line in 1970, which was renamed Prudential Grace Line, and was itself in turn taken over by Delta Steamship Lines in 1978, thereby extinguishing the name Grace in ocean shipping. Subsequently, Delta Steamship Lines was itself acquired and consolidated by Crowley Maritime in 1982." [HK0007][GDrive]

History [2000s]

2016 - GCP Applied Technologies created

"On February 3, 2016, Grace spin off its Grace Construction Products operating segment and the packaging technologies business into an independent company GCP Applied Technologies Inc." [HK0007][GDrive]



WIKIPEDIA

Wikipedia capture : [HK0007][GDrive]

Leadership

On the death of William R. Grace in 1904, he was succeeded by William L. Sauders as company President followed by Joseph Peter Grace, Sr. (1872–1950) who became president in 1907.

In 1974 The Peruvian Government announced that it assumed ownership of the properties of W. R. Grace & Co., Harold Logan, Grace executive vice president, stated the company would join the in governmental level talks over compensation of expropriated American concerns. The loss of Grace's properties in Peru began in 1969, when 25,000 acres of sugarcane plantations were taken over in an agrarian reform. The sugar lands were at Paramonga, 110 miles north of Lima, and at Cartavio, near Trujillo, 200 miles farther up coast. Grace still retained small mining properties producing copper, tin and silver, in southern Peru, about 100 miles north of Juliaca. Jose E. Flores, Head of W. R. Grace S.A. Peru, closed the mining operations for Grace in Latin America when the government of Peru nationalized the remaining interests.

Subsidiaries and products

Subsidiaries and some of their products include:

- Grace Catalysts Technologies
  - industrial catalysts, such as Raney nickel.
- Grace Materials Technologies
  - silica products
- Grace Construction Products
  - concrete admixtures, fibers, and grinding aids
  - concrete pigments
  - air and vapor barriers
  - fireproofing materials
  - bituminous, structural, waterproofing membranes (such as Roofing Underlayments and waterproofing materials)
- Darex
  - coatings, closures and sealants for soft drink cans and canned foods
- Residential Building Materials
  - roofing membranes and flashings for windows, doors, decks and roof detail areas

Contamination incidents

W. R. Grace and Company has been involved in a number of controversial incidents of proven and alleged corporate crimes, including exposing workers and residents of an entire town to asbestos contamination in Libby and Troy, Montana, water contamination in Woburn, Massachusetts, and an Acton, Massachusetts, Superfund site.

Asbestos

While Grace no longer makes asbestos-related products, W. R. Grace and Company has faced more than 270,000 asbestos-related lawsuits, of which 150,000 have been settled or dismissed and 120,000 remain.

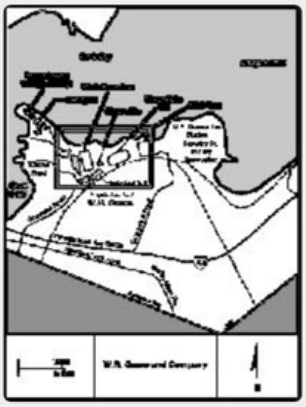
On April 2, 2001, Grace and its subsidiaries in United States filed voluntary petitions for Chapter 11 Bankruptcy reorganization in Bankruptcy Court for the District of Delaware. The company was trying to find the resolution through federal court-supervised reorganization in response to the quickly growing number of asbestos-related bodily injury claims.

On September 19, 2008, Grace filed a revised plan of reorganization to the same Court, jointly by the asbestos injury claimants. In January 2011, the Court issued an order in favor of the new plan and in January 2012, the Court denied all appeals and affirmed the plan. After a motion for reconsideration, the plan was reaffirmed on June 11, 2012.

On February 3, 2014, Grace emerged from this asbestos-related Chapter 11 bankruptcy which took more than 12 years. Under the plan of reorganization approved by the Court, all parties filings the asbestos-related claims should direct their inquiry to either an asbestos personal injury trust or a separate asbestos property damage trust.

W. R. Grace and Company (FUSRAP Site) in Curtis Bay, Maryland

W. R. Grace & Co.



W. R. Grace and Company (FUSRAP Site) in Curtis Bay, Maryland

The W.R. Grace and Company is located on an industrialized peninsula in south Baltimore, Maryland. In the 1950s the W.R. Grace and Company milled thorium for the Atomic Energy Commission (AEC), a predecessor agency for the US Department of Energy. W.R. Grace began processing radioactive materials at the site in the 1950s, when Rare Earths, Inc. (W.R. Grace's predecessor) entered into a contract with AEC to extract thorium and rare earths from naturally-occurring monazite sands. Rare Earths' contract with AEC and its license to possess, transfer and use radioactive thorium were transferred to W.R. Grace and Company. Building 23, where the thorium processing took place, was open until the late 1950s when the contract was terminated. The wastes were buried in a landfill area. Thorium processing resulted in low-level waste that was buried on the property. Radiation surveys have shown that radioactive contamination still persists in the waste burial area, the waste management area which surrounds the waste burial plot, surfaces surrounding vats and hoppers in Building 23 and alpha-radiation surface contamination in the whole of Building 23. The site was designated by DOE for remedial action under the Formerly Utilized Sites Remedial Action Program (FUSRAP) in 1984. This site was one of the 21 Formerly Utilized Sites Remedial Action Program (FUSRAP) sites where cleanup responsibility was transferred to the US Army Corps of Engineers in 1997 in accordance with the Energy and Water Development Appropriations Act for FY 1998. Cleanup responsibilities transferred at that time from DOE-EM to the USACE.

[HW000D][GDrive]

West Valley

1961 While industrial interests explore the viability of commercial reprocessing, the state of New York moves to acquire land in the town of Ashford, near West Valley, for an atomic industrial area. The state Office of Atomic Development establishes the Western New York Nuclear Service Center (WNYNSC) on the 3,345 acres of land it has taken title to.

1962 Davison Chemical Company establishes Nuclear Fuels Services, Inc. (NFS) as a reprocessing company. It reaches an agreement with the state to lease the WNYNSC.

1966 Nuclear Fuels Services develops and operates 200 acres of the WNYNSC. It operates the site as a nuclear fuel reprocessing center from 1966 to 1972, and accepts radioactive waste for disposal until 1975. During the operation of the plant, 640 metric tons of spent reactor fuel are processed, resulting in 660,000 gallons of highly radioactive liquid waste. The liquid waste is stored in an underground waste tank. NFS also utilizes a 15-acre area for the disposal of radioactive waste from commercial waste generators, and another seven-acre landfill is used to dispose of radioactive waste generated from reprocessing.

1976 Following four years of pursuing modifications to the plant, NFS decides the costs and regulatory requirements of reprocessing make the venture impractical. The company decides to exercise its right to leave the site after its lease expires on December 31, 1980, transferring ownership and responsibility for the waste and facility to the state of New York. The state initiates talks with the Federal Energy Research and Development Administration to sort out ownership of the waste and environmental remediation responsibility.

1980 Congress passes the West Valley Demonstration Project Act, Public Law 96-368, directing the U.S. Department of Energy (DOE) to take the lead role in solidifying the liquid high-level waste and decontaminating and decommissioning the facilities at West Valley.

1961 While industrial interests explore the viability of commercial reprocessing, the state of New York moves to acquire land in the town of Ashford, near West Valley, for an atomic industrial area. The state Office of Atomic Development establishes the Western New York Nuclear Service Center (WNYNSC) on the 3,345 acres of land it has taken title to.

1962 Davison Chemical Company establishes Nuclear Fuels Services, Inc. (NFS) as a reprocessing company. It reaches an agreement with the state to lease the WNYNSC.

1966 Nuclear Fuels Services develops and operates 200 acres of the WNYNSC. It operates the site as a nuclear fuel reprocessing center from 1966 to 1972, and accepts radioactive waste for disposal until 1975. During the operation of the plant, 640 metric tons of spent reactor fuel are processed, resulting in 660,000 gallons of highly radioactive liquid waste. The liquid waste is stored in an underground waste tank. NFS also utilizes a 15-acre area for the disposal of radioactive waste from commercial waste generators, and another seven-acre landfill is used to dispose of radioactive waste generated from reprocessing.

1976 Following four years of pursuing modifications to the plant, NFS decides the costs and regulatory requirements of reprocessing make the venture impractical. The company decides to exercise its right to leave the site after its lease expires on December 31, 1980, transferring ownership and responsibility for the waste and facility to the state of New York. The state initiates talks with the Federal Energy Research and Development Administration to sort out ownership of the waste and environmental remediation responsibility.

1980 Congress passes the West Valley Demonstration Project Act, Public Law 96-368, directing the U.S. Department of Energy (DOE) to take the lead role in solidifying the liquid high-level waste and decontaminating and decommissioning the facilities at West Valley.

Source : [HG0003][GDrive]

In 1959, New York State's interest in attracting atomic development culminated in the formation of the Office of Atomic Development (OAD) as an independent agency responsible for coordination of atomic regulatory and development functions within the State. To encourage nuclear development, the OAD acquired the West Valley site in 1961, which became designated the Western New York Nuclear Service Center (WNYNSC). The purpose of the Center was to store nuclear fuels and radioactive wastes and to be available for related industrial development.

The **Davison Chemical Co.** was sufficiently encouraged by the developments in the late 1950's to consider the feasibility of constructing a reprocessing facility. In 1961, Davison expressed interest in operating the WNYNSC. January 1962, Davison outlined its plans to the AEC for constructing a In private reprocessing plant. To pursue the reprocessing venture, Davison set up Nuclear Fuel Services, Inc. (NFS), whose stock was owned by the W. R. Grace Co. (78%) and American Machine and Foundry (22%). NFS, in its proposal, indicated its willingness to provide and maintain storage for a limited period of time for the high-level liquid wastes (HLLW) resulting from the reprocessing operations. Subsequently, the wastes would become the responsibility of the AEC. NFS also said it was willing to collect and return to the AEC an amount calculated to provide the estimated full costs for perpetual storage at the point of turnover. NFS was simultaneously negotiating to make New York State responsible for perpetual care of the wastes. The proposed, and eventually approved, method of waste disposition was to store them in liquid form in underground storage tanks, similar to the method being used at AEC production facilities.

Source : [HG0004][GDrive]

A stated purpose of the **Atomic Energy Act of 1954** was to promote "wide-spread participation in the development and utilization of atomic energy for peaceful purposes." The Atomic Energy Commission (AEC) actively encouraged private industry to enter the field of nuclear power. By the end of 1955, the AEC concluded agreements for the first few demonstration nuclear power reactors.

In 1954, the AEC began a program to encourage private reprocessing of irradiated nuclear fuel as part of its program to commercialize the entire nuclear fuel cycle. By January 1956 this program resulted in an announcement by the AEC that:

• The AEC would make available to industry AEC technology on reprocessing and the description of fuels available for reprocessing

• The AEC invited proposals by industry to design, reprocessing plants construct, and operate

• The AEC would provide assistance in the form of a baseload and allow the use of AEC facilities for development work and training.

During discussions of this program with industry, three predominant issues were raised. The first was the lack of adequate demand to make a commercial reprocessing plant economically viable. The AEC offered to provide a baseload of fuel from its production reactors to support the plant until adequate demand developed.

The second predominant issue was the lack of a basis for establishing reasonable charges for services. In 1957, the AEC announced a policy to assure that reprocessing services would be available for the first commercial irradiated fuel in 1961. Under this policy, the AEC would provide fuel reprocessing services in AEC facilities until services were available commercially at reasonable prices or until June 30, 1976. To establish charges for those services, the AEC designed a hypothetical reprocessing plant. The reasonableness of commercial charges was to be based on comparison with these hypothetical plant charges.

The third predominant issue was responsibility for the high-level radioactive wastes resulting from commercial reprocessing. The AEC policy was to encourage the maximum participation of industry in the management of these wastes. It was recognized that industrial longevity was insufficient to assume ultimate responsibility for these wastes. For West Valley, this factor was overcome by having ownership of the land reside with the State.

Perceiving an opportunity to promote industrial development within the State, New York, in 1956, had created a State Council on the Development of Atomic Energy, followed by the formation of the Office of Atomic Development (OAD) in 1959. In 1961, OAD acquired a 1350-hectare (ha) (3345-acre) site near the hamlet of West Valley in the Town of Ashford, Cattaraugus County, about 48 km (30 miles) south of Buffalo. The site was judged to be favorable for a nuclear fuel reprocessing plant and attendant waste facilities. It was favorably located with respect to projected nuclear reactor development in the north eastern and mid-Atlantic United States. In addition, the silty till in the West Valley area was relatively impermeable to water and would, therefore, provide protection against migration of waterborne radioactivity through the ground. Further advantages of the site were a low population density in the area and meteorological conditions favorable for atmospheric dilution of any radioactivity released. The site was named the Western New York Nuclear Service Center (WNYNSC); it is also referred to as West Valley or the Center.

The developments of the late 1950s were sufficiently encouraging for utility and industrial concerns to form the Industrial Reprocessing Group (IRG). The IRG, composed of Davison Chemical, Consolidated Edison, Commonwealth Electric, and Northern States Power, in 1ate 1959 initiated a technical and economic feasibility study of reprocessing. As a result of IRG's interest, the AEC delayed indefinitely the modification of facilities planned for processing commercial fuel, but would continue to receive fuels for which reprocessing capability did not exist or charges were not reasonable.

In 1961, the Davison Chemical Company expressed interest in the West Valley site. In January 1962, Davison outlined its plans to the AEC for constructing a private reprocessing plant. To pursue the reprocessing venture, Davison (which was acquired by W. R. Grace and Company) set up Nuclear Fuel Services, Inc. (NFS). W. R. Grace owned 78% of the NFS stock and American Machine and Foundry owned the rest.

NFS indicated its willingness to provide and maintain storage for a limited period of time for the high-level liquid wastes resulting from the reprocessing operations. Subsequently, the wastes would become the responsibility of the AEC. NFS also said it was willing to collect and return to the AEC an amount of money calculated to provide the estimated full costs for perpetual storage at the point of turnover. NFS was simultaneously negotiating to make New York State responsible for perpetual care of the wastes. The proposed, and eventu ally approved, method of waste disposition was to store the wastes in liquid form in underground storage tanks, similar to the method being used at AEC production facilities

W. R. Grace and Co. - Hiring of Otto Ambros

"PRINCIPAL CHARACTERS" ....

Otto Ambros: IG Farben chemist, codiscover of sarin gas and Buna synthetic rubber, he was awarded one million reichsmarks by Hitler as a scientific achievement award. Served the Reich as chief of the Committee-C for chemical warfare, manager of IG Farben's slave labor factory at Auschwitz and manager of the Dyhernfurth poison gas facility. He was tried and convicted at Nuremberg, and after an early release he worked for the U.S. chemical corporation W. R. Grace, the U.S. Department of Energy, and other European government and private sector business concerns.

Chapter 22 - 2014-operation-paperclip-annie-jacobsen-full-pdf.pdf / https://drive.google.com/open?id=11H814WZdxYyOKpQLM57z6wffU6EKsrvH

More important to the Operation Paperclip legacy is that when Rögner filed his civil suit, he named another name: Dr. Otto Ambros. Ambros was listed as a criminal in Rögner's complaint because he had been general manager of IG Farben's Buna factory at Auschwitz. German prosecutors looked into the Ambros case and saw that Ambros had already been tried and convicted of war crimes at Nuremberg and that he had served two years and five and a half months in Landsberg Prison. They decided not to press charges against him a second time. In December 1963, however, Ambros was called to testify at the trial, which was held in the Römer, Frankfurt's town hall. This brought Ambros into the limelight once again.

By 1964, Ambros had been a free man for thirteen years. He was an extremely wealthy, successful businessman. He socialized in Berlin among captains of industry and the professional elite. When the Frankfurt Auschwitz trial started, he was a board member of numerous major corporations in Germany, including AEG (Allgemeine Elekrizitats Gesellschaft), Germany's General Electric; Hibernia Mining Company; and SKW (Süddeutsche Kalkstickstoff-Werke AG), a chemical company. On the witness stand at the Frankfurt Auschwitz trial, Ambros gave testimony that contradicted statements he had made during his own trial at Nuremberg in 1947. He also said that the conditions at the Auschwitz Buna factory had been "cozy," and that the workers had enjoyed "good hospitality," which many Auschwitz survivors found appalling in its offensiveness. While contradictory statements might have gone unnoticed by Frankfurt's judges and jurors, there were a number of high-profile Israeli journalists in the courtroom who had become experts on the subject and caught Ambros's lies. These journalists began at once to investigate Otto Ambros's post-Nuremberg life. Here was a man who had been convicted of slavery and mass murder and had served very little time, considering the crimes. The Farben slaves at Auschwitz numbered sixty thousand, approximately thirty thousand of whom had been worked to death.

The journalists covering the trial were outraged by what they discovered. Otto Ambros now sat on the board of directors of numerous private corporations, but he was also on the board of directors of five companies that were owned by the Federal Republic of Germany. The exorbitant fees Ambros commanded in these positions were being paid by the German taxpayer. An Israeli female journalist, identified in Bundesarchiv documents only as "Frau Deutschkren," became so incensed by the arrogance and hubris she saw in Otto Ambros's postwar life that she wrote a letter to the state minister of finance, Ludger Westrick. That the Federal Republic of Germany was paying a "consulting fee" of 12,000 deutschmarks—about $120,000 in today's dollars—to a convicted war criminal was shameful, Frau Deutschkren said. She demanded that Finance Minister Ludger Westrick meet with her. He agreed.

Frau Deutschkren could not have known that Otto Ambros and Finance Minister Ludger Westrick were business colleagues and apparently on very friendly terms, as state archive correspondence reveals. After the meeting, Westrick promised to look into the matter. Instead, he told Ambros what was going on. In an effort to hold on to his lucrative and prestigious positions on company boards, Ambros produced a summary of the allegations against himself and his Nuremberg codefendants, written by his attorney, a Mr. Duvall. Ambros asked Finance Minister Westrick to circulate this apologia around the various boards on his behalf. "As a short summary of our case [shows] you will clearly find out we are innocent," Ambros explained, referring to charges of slavery and genocide that he and his Farben colleagues were convicted of at Nuremberg. "I and my colleagues are the victims of the Third Reich," Ambros insisted. "The former government utilized the success of synthetic rubber which they used to make a profit. If there had been anything against me, then I would have never been released by the American military." U.S. High Commissioner John J. McCloy had granted Ambros clemency under intense political pressure, a fact now being used by Ambros to suggest that he had been wrongly convicted at Nuremberg.

In a letter dated April 25, 1964, Ambros reminded Finance Minister Westrick that after he had been released from Landsberg Prison in 1951, "You helped me get back on the boards." For this, Ambros said he was grateful. "I see it as an honor and a duty to [remain] there. I do this for pure altruistic reasons. I appreciate anything you can do." In turn, Finance Minister Westrick wrote letters to the various boards on Ambros's behalf. "Ambros was chosen for the board because of exceptional talent," Westrick said. "In his field he is as wanted as Wernher von Braun. Everyone wants him. He can get a job anywhere he wants, anywhere in the world."

The Israeli journalists refused to let up on Otto Ambros. They continued to write news stories about him, making it increasingly difficult for both the Federal Republic of Germany and the publicly traded companies on whose boards Ambros sat to maintain business associations with him. "Former War Criminal Found Refuge in Switzerland," read a headline on June 6, 1964. The story detailed time that Ambros spent in the Swiss village of Pura. Ambros, furious, submitted a "statement of facts" to Labor Ministry state secretary, Ludwig Kattenstroth, in response. "I did not hide myself in Pura," Ambros wrote. "It is my holiday home. And I have to say that when I bought the parcel there [in 1956] I informed the Swiss government by handing over the judgment at Nuremberg. I am only there for holidays… my children go there, and my friends. After consulting with my lawyer, I will never go back." Then came the blaming. "The whole affair," wrote Ambros, "has to be seen in the shadow of the Frankfurt trial. A certain faction of the press is trying to blame me." The subtext was that "the Jews" were trying to blame him.

In late summer of 1964, AEG's board members met and decided that they could no longer retain convicted war criminal Otto Ambros. Ambros then also quietly left at least two of the five taxpayerfunded consulting positions he held on Federal Republic of Germany boards.

In separate letters to Finance Minister Ludger Westrick and Deputy Finance Minister Dr. Dollinger, a new secret was revealed, though Ambros promised not to make public a piece of the information they shared. "Concerning the firms abroad where I am a permanent co-worker advisor," Ambros wrote, "I won't name them [publicly] because I don't want to tip off any journalists who might cause trouble with my friends. You know about W. R. Grace in New York… and I hope I can stay with Hibernia Company. Concerning the firms in Israel," Ambros wrote, "stating their names publicly would be very embarrassing because they are [run by] very public, well-respected persons in public positions that have actually been at my home and are aware of my position, how I behaved during the Reich, and they accept this."

The "well-respected" public figures in Israel to whom Ambros referred have never been revealed. That Ambros also had worked for the American company W. R. Grace would take decades to come to light. When it did, in the early 1980s, the public would also learn that Otto Ambros worked as a consultant for the U.S. Department of

Energy, formerly the Atomic Energy Commission, "to develop and operate a plant for the hydrogenation of coal in a scale of 4 million tons/year at the former IG Farben industrie." That a convicted war criminal had been hired by the Department of Energy sparked indignation, and congressmen and journalists sought further details about Ambros's U.S. government contract. In a statement to the press, the Department of Energy insisted that the paperwork had been lost.

The scandal was brought to the attention of President Ronald Reagan. Letters on White House stationery reveal that Deputy National Security Adviser James W. Nance briefed Reagan about how it was that the U.S. government could have hired Otto Ambros. Nance's argument to the president was that many others hired him. "Dr. Ambros had contacts with numerous officials from Allied countries," wrote Nance. "Dr. Ambros was a consultant to companies such as Distillers Limited of England; Pechiney, the French chemical giant; and Dow Europe of Switzerland. He was also the chairman of Knoll, a pharmaceutical subsidiary of the well known chemical corporation BASF." President Reagan requested further information from the Department of Energy on its Ambros contract. Nance told the president, "The DOE and/or ERDA [The Energy Research and Development Administration] do not have records that would answer the questions you asked in the detail you requested. However, with Dr. Ambros' involvement in the company shown and his special knowledge in hydrogenation of coal, we know there were productive contacts between Dr. Ambros and U.S. energy officials." Even the president of the United States could not get complete information about an Operation Paperclip legacy.

In the midst of the scandal, a reporter for the San Francisco Chronicle telephoned Ambros at his home in Mannheim, Germany, and asked Ambros about his 1948 conviction at Nuremberg for mass murder and slavery.

"This happened a very long time ago," Ambros told the reporter. "It involved Jews. We do not think about it anymore.

1999-critical-mass-how-nazi-germany-surrendered-enriched-uranium-hydrick-prologue.pdf / https://drive.google.com/open?id=10bfHX6XHZ0I-cL7T9pdZ3hbY4yW2Iy4z

Prologue

[...]On 19 May 1945, eleven days after the surrender of Nazi Germany to Allied forces in Europe, a German U-boat was escorted into Portsmouth Naval Yard, New Hampshire. Underseacraft U-234 (as the Germans designated their submarines) was not the first U-boat to surrender at Portsmouth Naval Yard,2 but it was by far the most enigmatic.

The massive size of the U-boat alone - the submarine was three times larger than the standard German submersible - was quite enough to draw attention to the vessel. But there were other hints that spoke of the craft's singular status: News reporters covering the surrender of U-234 had been ordered, contrary to all U-boat surrender procedures before and after its capture, to keep their distance from crew members or passengers of U234 on threat of being shot by the attending Marine guards.3 Strict orders had been given that the press and all other observers must stay at least eight feet away from the disembarking POWs, and ropes were used to cordon off a corridor so the prisoners coming off the boat could march unhindered through the crowd.

The first group of sequestered POWs that marched down the gangway revealed another clue to the mysterious vessel's mission. ***At the lead was Luftwaffe Lieutenant General Ulrich Kessler, former commander-inchief of the German Air Force in Norway and the North Atlantic and newly-assigned air attaché to Japan****. The stem and monocled Prussian general was followed by an entourage; including Dr. Heinz Schlicke, a high-frequency electronics expert; seven other military officers, all scientists, engineers or military staff members; and two mysterious civilians. Neither the reporters nor indeed any members of the United States armed services at Portsmouth would ever see or know about the passenger who it now appears had been on board but who was not among the prisoners taken off the boat. Nor would the reporters soon find out about the cargo still deep inside U-234's hull.*

Reports did circulate of two Japanese officers on board who took their own lives in hara kari rather than submit to capture and the failure of their top-secret mission, which was to guarantee the safe arrival of cargo and passengers to Japan. According to rumors later proved to be true, they were buried at sea. But it seems another, more foreboding guest also had been on board. He probably now was somewhere in Spain.

As the most important prisoners were whisked away by airplane to Washington D.C., and the reporters were complaining among themselves of their lack of opportunity to interview the cabalistic captives, the ultimate secret of U-234 still lay quietly in its sleeping hull. For jam-packed throughout the monstrous boat was the elite of Nazi Germany's newest weapons development; including a completely disassembled Messerschmidt 262 jet fighter8 - the first jet aircraft to be used in combat -- and the plans and material to build Germany's ultrasecret V-4 rocket, the long-distance version of the feared V-2; as well as a mysterious "stratosphere plane," apparently an aircraft that could reach and cruise in the rarefied atmosphere of near space- ***But most important, buried in the nose of the mammoth boat, sealed in cylinders "lined with gold," was 560 kilograms, 1,120 pounds, of uranium oxide labeled "U235" - the fissile material from which atom bombs are made.***

Despite the cutting-edge technology, all of the other goods were dwarfed in significance by the uranium portion of U-234's cargo. The United States, dangerously short of its nuclear objectives, would spirit away the uranium, and other captured materials, for use in its own atomic bombs. Orders from the Commander Naval Operations in Washington DC. to the Naval Yard at Portsmouth commanded:

- *Desire following accomplished cargo U-234.... All material after rendering safe by mine disposal personnel placed safe stowage and inventory list sent CNO who will give shipping instructions and will control access to and disposition of all cargo due to vital importance to Pacific War.*

History seems to suggest U-234's killer cargo would soon be dropped on the U-boat's original destination - Japan.

How the uranium came to be in the U-boat, and the impact it would have on the outcome of the war against Japan and the future of the world, is a story of international intrigue to rival the most thrilling of espionage accounts. It is a story of unequaled scientific endeavor that toyed with the elementary building blocks of nature and of the universe and the staggering power with which it is held together; all being performed by the most brilliant minds of the age, under super-secret conditions, their projects swallowing staggering sums of money. It is the story of the struggle to control that power. It is a story of subterranean machinations unequaled in man's history, driven by selfish and evil men who were opposed by both honorable and suspect adversaries. And this chess-like struggle is counterpointed by raw power grabbing, achieved through such voluminous death and destruction as had never before been seen. To this day, it is the culminating story of power politics on earth.

The traditional history of the race for the atomic bomb - written by the victorious Allies - has taught us to believe the United States' atomic bomb program, the Manhattan Project, with help from Britain and mistakenly believing that Germany's nuclear program was striving to attain a bomb, had forged ahead and beaten the

Germans to the development of a nuclear weapon. The authors of that history would have us believe that only later was it discovered the Germans never were successful in progressing beyond a very elementary level of the bomb's development.

Nothing could be further from the truth.

The arrival in the United States of U-234 and its stockpile of nuclear materials saved the United States' atomic bomb program. Because of shortages of time and materials within the American bomb project, unreported until now, the United States needed the German goods and technology not only to gain victory over Japan, the only surviving member of the German-Italian-Japanese triumvirate, and win the war, but to establish its objective, as well, of making its place once and for all among the top world powers.

Prior to World War Two, America, while considered an ambitious contender for a place in the upper echelon of Earth's geopolitical elite, was still relegated to the status of "also ran" among the countries of the world. The British Empire, though slowly being dismantled, could still brag the sun never set upon its holdings and still acted as the reigning world power. Germany, in the few short years before and during the early part of the war, was making an aggressive effort to unseat Britain's shaky imperialism. Japan hoped to do the same in the East. The Soviet Union, like the United States, saw the war asan opportunity to make up distance in the international arena and fought for its place on the geopolitical globe. The potential introduction of an atomic weapon added a singular and determining dynamic to the equation. The bomb was the international equivalent of a sandlot free-for-all where one of the youngsters shows up with a machine gun: whoever had the weapon had control of the playground - if he could prove it was real and that he would use it.

Up to the time of the U-boat's surrender, America still had not been successful producing the weapon. True, the arrival of U-234's uranium on America's shore did not exactly replace the United States' atomic bomb program. ***To be sure, the Manhattan Project was enjoying levels of success on all fronts of the newly developing technology. Bomb-grade uranium was being enriched in Oak Ridge, Tennessee. Plutonium for nuclear weapons was being bred in huge reactors in central Washington State.*** *Advances in the understanding of nuclear technology and how to utilize it were being achieved at the national laboratory in Los Alamos, New Mexico and elsewhere.* ***The major problem was that the desired result - a usable bomb - was not going to be completed in time. While development of the bomb components were moving forward, a date had been set after which use of the bomb would be difficult to impossible; and even if it was used after that date, significant political potential would be lost.***

To optimize atomic bomb technology politically required it be used to foreshorten the war in the Pacific by the time Russia declared war on Japan, which the Soviets planned to do in mid-August 1945*. Any action significantly later would result in the parceling out of the Asia/Pacific region in the same way Europe was to bepartitioned, leaving Russia with more than its fair share of the globe. Worse, once the Soviet Union was in the war in the Pacific, in order for the United States to use the bomb details of its existence and development would have to be shared with the Soviet Bear - an intimidating proposition indeed, giving nuclear war capabilities to Joseph Stalin. Russia's helping to foreshorten the fall of Japan through conventional warfare before the bomb could be used would also eliminate America's powerful (and arguably justifiable) rationalizations for use of the bomb against the Island Nation. The United States would not only lose the opportunity to save countless Allied and Japanese lives, but it would also lose powerful political advantage it hoped to gain psychologically and in real terms if it could demonstrate it had an atomic weapon and the resolve to use it.*

Lacking enough enriched uranium to produce a uranium bomb (the type dropped on Hiroshima) at the time U-234 landed, and unable to complete the development of a reliable triggering device for a plutonium bomb (the type dropped on Nagasaki), the Manhattan Project greedily gobbled up the enriched uranium and detonation components available from the surrendered submarine. Three months later, the bomb materials finally reached Japan.

Why did Hitler fail to use the atomic bomb components before they fell into American hands? And how did Germany come to have the makings of an atomic bomb in the first place?

Substantial evidence exists that Germany led the race for an atomic bomb throughout the war. The Germans were unable, however, to use the weapon against their enemies in Europe because the weapon components were not completed until after the Luftwaffe (the German Air Force) had lost air supremacy in Europe. Germany then had no means to deliver the weapon on an enemy target. Following D-day, in June 1944, the Allies' close proximity to German troops on the European continent and in the Fatherland itself eliminated any potential attempt to use the weapon by Germany because of the improbability of successfully surreptitiously spiriting a nuclear weapon weighing several tons many miles behind enemy lines for detonation. ***There was no guarantee the weapon might not be captured and turned against them in one treacherous moment. As a result, arrangements were made at the highest level to export the technology and bomb components to Germany's ally, Japan.*** *Germany presumably hoped a Japanese victory in the Pacific would mean a victory for the Triumvirate, which would still ultimately result in Aryan domination of Europe.*

The masterminds behind development of the German nuclear weapon were not those men so often cited as the reigning scientific minds of the Third Reich - Heisenberg, Hahn, Weizsacker, Bothe and others. *Heisenberg and his cronies are correctly characterized in the traditional history as having been so full of petty professional jealousies and pompous pride they could not productively work together to reach a common goal. The true masterminds of the German atomic bomb did not struggle under these conditions and the paltry budgets the traditional history suggests were provided the German scientists. The real masterminds of the German atomic bomb were not restricted by a lack of highly technical production capacity either, as the traditional history suggests was the German program. Nor was that production program under constant scrutiny by Allied nuclear reconnaissance efforts, as the traditional history asserts would have been the case had the Germans actually been more successful with their bomb project.*

The true masterminds of the German atomic bomb program were ***experimental physicist Baron Manfred von Ardenne****, his* ***theoretical/experimental physicist colleague Fritz Houtermans****, and an army of scientists and technicians. This intellectual armada was provided, as was the extravagant funding for the program, by one of the Third Reich's richest and most successful sources of research and development sustenance - the German postal service. As bizarre as this may seem, it is a documented fact the postal ministry supported with hundreds of millions of reichsmarks, possibly billions, an excellent technical branch that, among other remarkable achievements, successfully tapped and decrypted the complex technology of a dedicated transatlantic hot-line established early in the war between Franklin Roosevelt and Winston Churchill. All students of the race for the atomic bomb know Adolf Hitler himself once joked (as they, probably wrongly, characterized the comment) following a report by his Minister of Posts on the progress of the ministry's nuclear research and development program, that it would be his postal service, not his military, that would win the war for him with the secret weapon it was developing.*

Significant and substantial documentation exists that proves Ardenne and Houtennans worked on far-reaching nuclear weapons programs well advanced over Heisenberg's work, and funded and supported by the Ministry of Posts; and that Hitler on multiple occasions personally visited Ardenne's laboratories in Berlin Lichterfelde. No record could be found by this author of Hitler ever having shown such support for Heisenberg's supposed atomic technology-leading nuclear reactor site, or that of any other nuclear scientist. Hitler insisted, nonetheless, that Germany would win the worldwide struggle using a secret weapon with destructive powers far superior to any previously known instrument of war.

Once Ardenne and Houtennans developed the technology, the massive and sophisticated mechanisms required for producing the fissile material had to be built and

Once Ardenne and Houtermans developed the technology, the massive and sophisticated mechanisms required for producing the fissile material had to be built and operated in a safe location, free from Allied detection and bombing. ***With United States aircraft screening German skies daily for emissions laced in xenon-13315 and monitoring the Fatherland's electrical power usage for indications of inordinately high consumption of electricity and other characteristics that would signify existence of uranium enriching facilities, the Germans needed to find a location that would allow the work to go forward undisturbed. And big business needed to be brought in and tasked with building the secret, gargantuan industrial complex to enrich uranium. This business would be the German counterpart to DuPont, General Electric, Westinghouse, and Tennessee Eastman working on the Manhattan Project in the United States.***

The safe location required for building this complex and the company retained to do the work were both found in I.G. Farben. During the war, this German conglomerate constituted the largest single chemical concern in the world, outsizing the top four United States chemical companies combined (all of which were working on the Manhattan Project). Farben had pioneered and owned the worldwide rights to the development and production of synthetic gasolines and rubbers including those in the United States- Synthetic product technology required high-pressure, very demanding capabilities that were a good jumping-off point for the science needed to n n or build and operate a nuclear plutonium-breeding reactor.

In the early 1940s, the company had in fact started constructing a buna plant, a synthetic rubber product, at a location outside of Germany *- perfect for the requirements of freedom from scrutiny by Allied reconnaissance.* ***The buna plant construction would allegedly last twice as long as planned, eventually cost LG. Farben 900 million reichsmarksl 6 (approximately $2 billion), utilize over 25,000 laborers,l 7 and devour more electricity than the entire city of Berlin, but it would never produce a pound of buna.*** *All of these characteristics run counter to those one would expect to observe from an actual buna manufacturing plant.* ***But they would have been perfectly expected of an electromagnetic isotope separation facility - the technology Ardenne and Houtermans had successfully pioneered - required to enrich uranium for nuclear bombs.***

---> The location was picked by Otto Ambros. Otto Ambros was the factory manager. This location is the Mn

Monowitz concentration camp - Wikipedia

(**see** https://en.wikipedia.org/wiki/Monowitz_concentration_camp)

Saileaie. Ambros was IG Farben's expert on buna AND on poison gas.

By 1942 he conceived the technology used by modern magnetic tapes.

Are he chose - 3 rivers (vital source of water) and a coal plant.

And access to SLAVE LABORE (not abailable at other sites.)

See - https://en.wikipedia.org/wiki/Monowitz_concentration_camp

"The creation of the camp was a result of an initiative by the German chemical company IG Farben to build the third largest plant to produce synthetic rubber and liquid fuels. The camp was supposed to be located in **Silesia**, out of range of Allied bombers. Among the sites proposed between December 1940 and January 1942 the chosen location was the flat land between the eastern part of Oświęcim and the villages of Dwory and Monowice, justified by good geological conditions, access to transport routes, water supply, and the availability of raw materials such as: coal from mines in Libiąż, Jawiszowice, and Jaworzno, limestone from Krzeszowice, and salt from Wieliczka. However, the primary reason for building the industrial complex in that location was the immediate access to the slave work-force from the nearby Auschwitz camps. "

While the deadly purpose of the work done at the alleged buna facility has been virtually unknown to the world until now, the name of the place it was located carries an aura of condemnation nonetheless, earned for its other malignant purpose. The place is Auschwitz.

Located on the banks of the Vistula River in Poland, the concentration camp was the perfect site for Farben's facility. Vast coal reserves to provide the fuel necessary for allegedly heating buna and for use as buna feed stocks, but, in fact, for generating electricity, were mined nearby. The river provided additional energy and cooling for the plant's high-temperature processes. The major railroad spur located there provided easy transportation of equipment to, and product from, the plant. The vast pool of cheap labor available from the camp, which Farben infamously exploited throughout the war and for which the company paid the price dearly afterward when the Nuremberg Trials found it guilty of crimes against humanity and other human rights violations and ordered the dismantling of the conglomerate, were all components in selecting the location. But the best reason of all for selecting the site was the fact the proposed buna plant would provide the needed technological base and an excellent cover for what would actually be produced - enriched uranium.

Synthetic rubber technology was still so new few people would know what to look for in a buna plant - or a uranium enrichment plant. And even better, much of the high-end technologies, materials, skills and services required to deal with the high pressures, high temperatures and demanding performance of reactor vessels in a buna plant were also needed to construct and operate an electromagnetic separation facility.

Qualified Farben personnel performed the demanding aspects of construction, while almost all of the non-technical facilities at the "buna" plant at Auschwitz, requiring a veritable army to erect and maintain the buildings and simple structures that supported the sophisticated technology, were built and manned largely by the ill-fated inmates. The last of their physical energy - their very beings - was drained from them by the work and they were driven to the gas chambers while enriched uranium was being collected and stockpiled for its future, sinister purpose.

Standing silently at the center of this immense German atomic bomb program was one man. He had deep and powerful personal connections to each key player in the project. One of these relationships was old and sealed with blood - that he had with Rudolf Hoess, the Commandant of Auschwitz, with whom he helped murder a man, an enemy to the cause, when they were both young and unknown.

Another of these relationships was bound together by tremendous wealth. Billions, probably tens of billions of reichsmarks, were amassed when he colluded with Hermann Schmitz, the chairman of 1.0. Farben. He and Schmitz camouflaged a huge fortune in securities and other portable properties and, with the war winding to a close, they removed the funds from Nazi Germany and carefully disseminated them into the markets of the free-world economy for their later use.

Still another of these relationships was bound together by power derived from the position he held as the most highly regarded lieutenant of arguably the most powerful man on Earth. His advocacy with the Fuehrer on behalf of Minister of Posts Wilhelm Ohnesorge fed the enormous research and development program Ohnesorge - formerly a mathematician and physicist - operated within the postal ministry.

The final, fateful, least secure but most important relationship was forged in the final days of his, and - Germany's, power - with Grand Admiral Karl Doenitz. Doenitz was commander of the German U-boat navy, and was the man with whom he would trade the supreme leadership of all Gennany for a place on one of the Adm iral's fleeing Uboats, apparently having previously secretly agreed to pay to the United States the price of his own ransom - in the currency of atomic weaponry.

This man was Martin Bormann.

In the dismal days at war's end, buried in the bunker in Berlin that constituted the final seat of Hitler's government; with the world crashing in around them; with Hitler high on drugs and low on mental and emotional reserves; with the - leadership panicked and breaking for cover; the mysterious Martin Bormann, true to his Machiavellian nature, weaved one of his most deadly, intricate and yet enduring webs. These machinations succeeded in deft strokes to dismember from the Party leadership both Hermann Goering, political heir apparent to Hitler's throne, and Heinrich Himmler, purportedly next in line of ascension. In their stead a seeming anomaly, and long misunderstood historical event, occurred, in which Admiral Doenitz, with no apparent political leanings and no political following, mysteriously took over the reins of German government from Adolf Hitler. Bormann had shrewdly negotiated with Doenitz the now hollow leadership of all Germany in exchange for a place on the U-boat he knew was leaving for Japan with its belly full of the power of the future, which to a large extent Bormann had made possible. From the bunker Bormann made his final arrangements to reach Doenitz at his U-boat headquarters. The web was being woven.

The fortune from LG. Farben and additional funds that Bormann had camouflaged through a variety of financial instruments and then had surreptitiously exported into banks and businesses around the world silently awaited him once he was free of Germany. Agreement by the United States to allow his escape and to protect him from the justice sure to be demanded by - victims following the war appears to have already been achieved. The arrangement would ensure his life-long freedom in the post-war world, paid for with the atomic bomb.

History Article from "ReferenceForBusiness.com" : "W.R. Grace & Company - Company Profile, Information, Business Description, History, Background Information on W.R. Grace & Company"

See [HW000B][GDrive]

7500 Grace Drive , Columbia, Maryland 21044 U.S.A.

Company Perspectives:

Grace is a leader in catalysts and silica products, construction products and container products. Our products enhance the performance of your petroleum products, ensure the integrity of some of the world's major buildings and bridges, increase the quality of images on ink jet paper, improve the appearance of your fine wood furniture and preserve the safety of your foods.

History of W.R. Grace & Company

W.R. Grace & Compamy is one of the oldest and most adaptable U.S. corporations. Over the course of its 150-year existence, it has been involved in areas of business ranging from fertilizer to shipping to consumer goods to specialty chemicals. At one time or another, the company, in addition to its current role as one of the most comprehensive, specialty chemical and packing companies in the world, has been the world's largest distributor of spaghetti, a cowboy apparel retailer, and owner of an airline. Despite a tumultuous history--most recently involving extensive asbestos litigation and a resulting Chapter 11 filing--W.R. Grace has survived, with an adaptability and flexibility unusual in large companies. It may be hard to believe that W.R. Grace & Company started out shipping guano, or bird droppings, from South America.

In the Beginning

In 1854, William Russell Grace and his father, James Grace, traveled to Callao, Peru. James, a prosperous Irish landowner, wanted to establish an Irish agricultural community. He hoped to rebuild the family fortune which had been depleted during the Irish famine of 1847-48 when he provided employment to a large number of people from the countryside around his estate. Not finding the prospects he had hoped for in Peru, James soon returned to Ireland.

William, however, remained in Peru and became a clerk in the trading firm of Bryce & Company. His value to the company was recognized after a few years when he was made a partner in the firm, which was then renamed Bryce, Grace & Company. Under William's direction, the commercial house soon became the largest in the country.

Poor health forced William to retire from the Peruvian business in 1865. He returned to New York City where he had spent a year during his youth. His brother, Michael P. Grace, who had joined him earlier in South America, remained behind to manage the growing family business in Peru which was soon named Grace Brothers & Company.

With his health fully recovered, William established W.R. Grace & Company in New York. William had long been a confidant of the Peruvian president, and through this connection the company became the Peruvian government's agent for the sale of nitrate of soda.

The Chile-Peruvian war of 1887-81 severely weakened Peru's economy, and the government had difficulty repaying its foreign debt. In 1887, a group of foreign bondholders in the Peruvian government, mostly British, called on Grace Brothers & Co. to attempt a settlement of the debt. Michael accepted the offer and in the settlement he negotiated, known as the Grace-Donoughmore Contract, two Peruvian bond issues amounting to $250 million were cancelled in exchange for equally valuable concessions to the bondholders. Bondholders received shares in a newly-established company, The Peruvian Corporation, which received the rights to two state-owned railroads for 66 years, all Peruvian guano output up to 3 million tons (except for that on Chincha Island), a government promise to pay shareholders 80,000 pounds sterling annually for 30 years, and ownership of the lucrative Cerro de Pasco silver mines. In return, the shareholders agreed to finish uncompleted railroads and repair existing ones within certain time limits. (Most of the contracts for supplying the railroad building program went to the Grace company.)

At the time of the company's incorporation in Connecticut in 1899, Grace listed capital of $6 million. The amount, however, undervalued the company's worth. since it did not include Grace Brothers & Co. Limited in London and its branches in San Francisco, Lima, and Callo, Peru as well as Valparaiso, Santiago, and Concepcion Chile.

The Next Generation

When William Grace died in 1904, control of the company passed to his brother Michael, who became chairman. In 1907, he negotiated a new agreement with the Peruvian government annulling the terms of the previous agreements and extending the Peruvian corporation's lease for 17 years. The government agreed to continue paying £80,000 annually to shareholders for 30 years, but made claims to one half of the company's net proceeds.

William's son, Joseph, who started working for the company's corporate offices in New York in 1894 when he graduated from Columbia University, became President in 1909. The company underwent a period of rapid growth during Joseph's presidency, and, in the process, greatly expanded South American production and trade.

In 1929, the year Joseph became chairman of the board, W.R. Grace and Pan American-Grace Airways [HK000C] together established the first international air service down the west coast of South America, Pan American Grace Airways otherwise known as Panagra.

After suffering from a stroke in 1946, Joseph retired. A feud subsequently broke out among family members over who should run the company. Eventually, Joseph prevailed, and his son, J. Peter, after some misgivings of his own, became president.

Expansion and Diversification

At the age of 32, Peter inherited a company with $93 million in assets and whose primary interests were in Grace Steamship Lines, Grace National Bank, Panagra, sugar plantations and cotton mills in Peru and Chile. The company also produced paper and biscuits, mined tin, and grew coffee.

From the very beginning, Peter was concerned about the political and economic instability of South American nations that he believed threatened Grace's operations. In particular, many companies had shown resistance to U.S. domination of their economies. With what proved to be remarkable foresight, Peter embarked on a plan of diversifying into U.S. and European investments, seeking to reduce South American investments from 100 percent to 5 percent. To raise the capital necessary for his expansion the company went public in 1953. The board of directors resisted his plan of broadening investment and, though the Grace family owned more than one-half of the company's stock, he nearly lost his position as chief executive officer.

Attracted by profits achieved by Dupont, Peter began searching for investments in the chemical industry. He purchased two major chemical companies which made Grace the nation's fifth largest chemical producer. In 1954 Grace completed a merger with Davison Chemical Corporation, a manufacturer of agricultural and industrial chemicals. Later that year, Grace purchased Dewey & Almy Chemical Company, an investment one industry analyst later called "among the greatest acquisitions of all time." A producer of sealing compounds and batteries, Dewey and Almy grew rapidly and earnings quickly surpassed the $35 million purchase price. This became the foundation for one of the world's largest specialty chemical operations. Over the next 11 years, Grace acquired 23 more chemical companies for four million shares of stock.

Seeking to enter markets that could compensate for the cyclic nature of the fertilizer industry, Grace set out to build the "General Foods of Europe." Over the decade, Peter Grace purchased a chocolate producer in the Netherlands, a Danish ice cream maker, and an Italian pasta company. Critics charge that he was searching for companies he could shape and manage himself, attempting to prove he was his ancestors' equal as an entrepreneur.

Peter continued selling the company's old businesses and using the money to acquire new ones. In August 1965, he sold Grace National Bank to what is now Marine Midland Bank. The next year, he acquired a 53 percent interest in Miller Brewing Company. And in 1967 Peter sold the company's 50 percent interest in Pan American Grace Airways to Braniff Airways for $15 million.

The late 1960s proved a difficult time for Grace. The fertilizer market became severely depressed, where it had once been a source of substantial profit. Facing falling profits, Grace attempted to boost efficiency by closing marginal plants, but in the process the company incurred huge losses.

In the meantime, relations between Grace and Miller Brewery's minority stockholder, an heir to the company's founder, had turned for the worse. Peter realized he would never be able to buy the rest of the company. Thus, in 1969, Grace sold its holdings in Miller for $130 million, resulting in a net profit of $53.9 million.

In the early 1960s, the company management had reversed its previous policy in regard to South American investment and began pouring funds into paper, food and chemical companies. Later that year, however, Grace's fears about these investments came true when the Peruvian government seized the company's sugar mills and a 25,000 acre sugar plantation. Earnings on South American operations tumbled from $12 million the previous year to zero on sales of $256 million. Peter, not discounting the possibility of pulling completely out of the region, said that company investments in future would be made on the attitude of each individual country.

In the early 1970s, W.R. Grace made a move into consumer goods. In 1970, the company purchased Baker & Taylor, a supplier of books to libraries, as well as FAO Schwarz, the New York toy store. Hoping to cash in on the U.S.'s love affair with leisure-time activities, the company acquired Herman's World of Sporting, a landmark in New York's financial district.

Grace saw a chance for substantial returns in the sporting goods business. Involvement in the market was especially attractive since there were no national sporting goods chain stores. Department stores, preferring the profits and turnover of apparel and other "soft" product lines, had shunned sporting goods. The company sought to expand Herman's from three stores with $10 million in sales into the first national chain. As part of the plan, Grace bought Mooney's of Boston, Atlas of Washington, and Klein's of Chicago and converted them to Herman's sporting goods stores.

In 1971, the year that Peter became chairman, the company's profit was at its lowest point in years, after hitting a high of $82 million in 1966, and its return on equity was well below that of other conglomerates. Extraordinary (or, one time only) write-offs, became such a regular part of the company's financial statements (just that year the company wrote off $7.8 million from closing fertilizer plants) that some security analysts had come to consider them a regular part of Grace's operations. Consequently it was not surprising that in 1972, company executives produced a 700-page memo, establishing 20 criteria for acquiring a new business. Most importantly, these executives decided that in order to be purchased a company must have $20 million in sales and $1 million in profits.

In 1974, Peter began to reduce the company's holdings by selling a grocery products venture, and began to concentrate company investments in three areas: consumer goods, chemicals, and natural resources. Fertilizer profits had rebounded because of low supply and high worldwide demand, but the consumer groups showed lackluster profits even with large sales in sporting goods. In addition, Grace's final investment in Peru was severed later in the year. The Peruvian government nationalized its paper and chemical operations, leading to a loss of $11.5 million for the company, despite $23.6 million in compensation from the government.

By 1976, the company was ready to continue its move into consumer goods and services. Later in the year, when the company was about to make a public stock offering to raise capital for further expansion, it received an offer from Peter's old friend Friedrich Karl Flick, who during the 1950's had worked for Grace National Bank for three years. Flick, head of Friedrich Flick Industrial Corporation, Germany's largest family-owned company, was looking for somewhere to invest the $900 million it had recently made from the sale of its 29 percent interest in Daimler-Benz to Deutsche Bank. Wanting to take advantage of German laws that granted tax free capital gains and dividends earned on investments of more than 25 percent ownership in foreign companies, Flick eventually bought a 30 percent stake in Grace.

Although Grace family interest in the company had dwindled to 3 percent, Peter made it clear that Flick would not run the company. Receiving seats for only three of the company's 35 directors, Flick nonetheless obliged, since he was concerned with his own business ventures in Europe.

The consumer divisions' growth accompanied increasing internal strife at the company. In 1979, after years of watching the company's stock trading at low earnings multiples, management proposed splitting up the company into seven or eight separate companies which would command higher stock prices. Worried about the company's increasing reliance on consumer products, they also suggested selling the energy division whose market value could have been as much as $1 billion over book value. Peter, unwilling to give up his control of the company which might also have resulted from these proposals, rejected both ideas.

1980s: The Beginning of Specialization

At the beginning of the 1980s, Grace's move into natural resources appeared as if it was going to be as profitable as its venture into chemicals. The

company's energy reserves had grown to 73 million barrels of oil, 300 billion cubic feet of natural gas, and 239 million tons of coal. Specialty chemicals sales and earnings, meanwhile, rose an average of 15 percent annually over the last decade. The company had 85 product lines, ranging from plastic packaging materials to petroleum cracking catalysts, many of which were market leaders.

However, the company suffered with falling energy prices in 1981. Moreover, in 1982, the combination of a poor natural resources profit and a further decline in the fertilizer business led to a 50 percent decrease in the company's profitability. As a result, Grace petroleum was put up for sale in 1984. The retail and consumer goods divisions, which were returning just 14 percent of profits on 36 percent of sales, looked like they might be next.

At the same time, however, Grace began to pursue business interests that would eventually become the main focus of the company: specialty chemicals and materials. Particularly significant was the 1985 acquisition of Chomerics, Inc., a packaging and coating manufacturer. The company, which had been losing money, was acquired through a $99 million stock swap.

The company's problems were compounded in 1984, when Flick became the target of a government bribery scandal and was forced to confront a $260 million dollar tax bill. Rumors abounded in West Germany that Flick was looking for someone to buy the family business, putting Grace at risk of a hostile takeover.

The rumors about Flick proved true, when Deutsche Bank acquired the company and put its holdings in Grace on the market. The company immediately seized the attention of takeover specialists, since Grace's assets could be sold at a profit of $20 to $25 more than the market price. GAF Corporation Chairman J. Heyman approached Grace about a friendly takeover, causing Grace's stock to rise 30 percent.

Although already strapped for cash, Peter, fearing a takeover, was forced to buy Flick's holdings for $598 million. The acquisition put Grace's debt at $2.6 billion and caused a downgrade of Grace's credit rating.

Critics, both inside and outside the company, regarded this as an unthinking decision. Complaints about Peter's domination of the company and an incoherent business strategy put mounting pressure on him to sell the consumer division. Since Grace was desperate for cash, this forced Peter to comply. Energy and fertilizer investments were reduced. Herman's was sold to Dee Corporation for $227 million, realizing a profit of $144 million. The remaining consumer goods businesses were sold for $500 million, but because of high expansion costs at the 317-store home center operations, Grace barely broke even on the sale. In addition, in 1986, Peter agreed to selling 51 percent of the restaurant division to its management in a leveraged buyout, although Grace did not bail out of the newly created Restaurant Enterprises Group until 1993. In 1986, William Baldwin wrote in Forbes that a $1 investment in W.R. Grace in 1945 would be worth $23 23 years later; but, the same investment in the S&P 500 would be worth a corresponding $77. Some speculated that Peter wished to live up to his grandfather's entrepreneurial spirit by remaking the company his own way, and Peter himself said that "My grandfather didn't found any of the things we have now. He didn't found this company. I did." While Peter Grace was definitely onto something, Forbes' Thomas Jaffe considered the company severely undervalued in 1989. Speculation arose that Peter might resign.

The 1990s: A Leaner, Meaner Company

In January 1993, J. Peter Grace did stepped down as CEO, ending the longest term of any CEO in history. His successor, J.P. Balduc, had been groomed for the position since joining Grace in 1983, eventually becoming COO and president in 1990. In contrast to Peter Grace, of whom Smith Barney analyst James Wilbur said, "You never knew what business he'd be in next," Balduc took the reins of an ambitious restructuring plan, stating, "There is no backing up. The days of Grace buying companies that are not strategic are gone." First announced in 1991, this plan was to cut back Grace's operations to two lines of business, specialty chemicals and health care, and called for a divestment of 25 percent of the company's assets. Although Peter Grace retained his position as chairman, it was clear that Balduc was in charge as the company began to lose all resemblance to a family-run operation, becoming more like a standard corporation.

This transformation, it seemed, was long overdue. Although Grace topped $6 billion a year in sales in 1993, its profit on those sales was only $26 million, and the sprawling company was so heavily diversified that it owned over 100 subsidiaries. When Balduc trimmed it to six core businesses, the sold-off assets, which included divisions ranging from organic chemicals to restaurants to book distribution, were worth nearly $1.5 billion. Some argued, reflecting the emphasis on specialization in business that had become a 1990s trend, that even six was too much, particularly when the six ranged from specialty chemicals to health care to food packaging. Under Balduc's leadership, health care emerged as the most prominent part of Grace's business, in the form of the National Medical Care division, and the company's goal of $10 billion by 2000 seemed possible.

However, Balduc's term had barely begun when the company--and, Balduc himself--was once again embroiled in controversy. On March 2, 1995, Balduc abruptly resigned from Grace, citing philosophical differences with the board of directors. Inevitably, further--and, less abstract--details surfaced, among them allegations that Balduc had threatened to disclose details of previously unreported financial compensations to J. Peter Grace and to his son, J. Peter Grace III. Additional allegations of sexual harassment on Balduc's part toward five female Grace employees surfaced as well, although the harassment allegations came not via Grace's official procedure on sexual harassment, but via the company's board of directors, with no formal complaint being filed. This gave rise to suspicions that the company wished to avoid placing Balduc in the chairman's seat. The chairman's seat had recently been vacated by Peter Grace due to pressure from major shareholders, who also influenced the company's decision to reduce its board of directors from 22 members to 12. Whatever the truth may have been, both Balduc and Peter Grace departed; the latter, already ill from lung cancer, died a few weeks later, and Albert J. Costello was named CEO.

If anything, Costello was more aggressive about streamlining the company than his predecessor. This included spinning off Grace's medical care division, National Medical Care, in a sale to German-based medical company Fresenius AG, despite a federal investigation into the division's handling of Medicare charges and an FDA citation regarding importation of dialysis equipment from its Dublin plant. In addition, Grace sold its Dearborn water treatment business--then the third largest in the United States--to Betz Laboratories; its transgenic plant business to Monsanto; its TEC systems division to Sequa Corporation; its specialty polymers business to National Starch and Chemical Co.; its cocoa business to Archer Daniels Midland; and more. Other actions included a buyback of 10 million shares of common stock, amounting to approximately 10 percent of the total, as well as a new two-year corporate reorganization, inaugurated late in 1995. This move, designed to cut costs by $100 million, reduced the company's staff by 800. Over 50 percent of the cost reduction was due to decreased staff as Grace sought to reduce its number of core businesses from six to three. Those businesses were streamlined also; for instance, in June 1997, Grace set out to restructure its packaging business on a global basis, saving an estimated $25 million a year.

Costello was not only focused on selling, however. At the annual shareholders' meeting in 1996, he said, "We are a much more focused and financially disciplined company, targeting performance levels that will put us in the top quartile of our peer companies." While Grace's divestments had increased its value and decreased its liability, its CEO sought acquisitions and joint ventures in keeping with the company's newer, narrower focus. In April 1998, Grace's remaining divisions essentially split: the specialty chemicals divisions, consisting of Grace Davison, Grace Construction Products, and Darex Container

Products, kept the W.R. Grace name, while the Cryovac packaging business merged with Sealed Air Corporation. Now in essence a chemicals company, W.R. Grace & Co. bore no remaining resemblance to its namesake's initial venture.

On November 2, 1998, the top chair at the new Grace changed hands again. This time the new name was former Allied-Signal executive Paul Norris, who was named president and CEO, and was slated to take the chairman position as well. Norris immediately announced a plan of divestiture, streamlining, and job cutting, and was quoted in trade publication Chemical Week that "We can't just offer products to our customers anymore. We have to control our costs as well as help control our customers' costs by providing services to them." The following year, Grace moved its corporate headquarters from Boca Raton, Florida, where it had been quartered since 1991, to Columbia, Maryland, the location of its specialty chemicals division. The move cut costs both by reducing staff and by moving the headquarters closer to its business divisions. Also in 1999, Grace cut 370 jobs, or approximately 8 percent of its workforce, as part of a restructuring designed to streamline the company still further. Grace was not alone; in 1999, the trade publication Chemical Week noted an industry-wide trend toward reducing spending, as a slowing economy cut into profits. Chemical Week noted that Grace's capital spending in 1998 was $95 million, as opposed to $137 million in 1997, a 30 percent reduction. In addition, Chemical Week reported that in 1999, of the 40 top publicly traded chemical companies, 11 had new CEOs.

By 2000, it appeared that Norris had succeeded in his aim. W.R. Grace had slimmed down from a $5.7 billion conglomerate to a $1.5 billion company specializing in chemicals. Instead of 30 business divisions, it had only two: Grace Davison, and its performance chemicals division. In 1999, the company had $1.47 billion in sales, with a goal of 15 percent earnings growth for 2000. By 2001, Norris intended to reach the $2 billion sales mark, partly through acquisitions, partly through the introduction of new products, and to boost the company's sagging stock price. This reflected the two-fold strategy he described to Chemical Specialties in July 2000: "We have a number of initiatives. The majority involve bringing new products to existing markets. But in some cases we want to enter new markets with new applications for existing products." He added that "Growth is the most difficult of all strategic agenda items, but I think it's the most important." Although Grace continued to acquire new companies, the deals involved were relatively small, and in keeping with the company's new goals: purchases of coating and sealant manufacturer Bayem SA in 1996, food packaging manufacturer Schurpack in 1997, the construction chemicals division of Sociedad Petreos in 2000 (incidentally, returning Grace to its original region of business in South America), Crosfield Group's hydroprocessing catalyst business in 2000, International Protective Coatings Corporation in 2000, and similar acquisitions were examples of the company's more focused acquisitions approach. Acquisitions continued into 2001, even as Grace faced redoubled legal problems.

With the new millennium, Grace faced a new obstacle: asbestos litigation. And, while Norris claimed that publicity from the asbestos suits against the company--numbering in the hundreds of thousands by 2001--had little to do with the stock price, it is a fair bet that Grace's bankruptcy filing did.

The 1990s also saw the long-overdue publication of William Russell Grace's biography, Merchant Adventurer, by the Pulitzer Prize-winning author Marquis James. The book, commissioned by William Grace's son Joseph, and originally scheduled for publication by Viking Press in 1948, was suppressed by the Grace company, for reasons that remain unclear. Discovered in a disused storage room in 1978 by historian Lawrence Clayton, himself the author of Grace: W.R. Grace & Co., the Formative Years, 1850-1930, the book was finally published by Scholastic Resources in 1993.

2001: The Final Chapter?

Legal action, of course, is a way of corporate life, and a company the size and breadth of W.R. Grace was certainly no exception. A high-profile pollution case in 1986 pitted Grace against eight families in Woburn, Massachusetts over the question of drinking-water contamination; Grace settled for a reported $8 million, and the case was a subject of the book and film "A Civil Action." In 1995, Grace's patent on the extraction of the natural pesticide, azadirachtin, from Indian neem trees was challenged, as the substance had been used for that purpose in India for hundreds of years. In 1998, the company agreed in a settlement to pay $32 million for remediation of a radioactive waste site, and the SEC sued Grace that same year over reserves pertaining to former subsidiary National Medical Care (the suit was settled out of court). 1999 brought an emergency order from the Environmental Protection Agency to clean up ammonia near Lansing, Michigan, which threatened the local water supply. The ammonia was a byproduct of Grace fertilizer production from the 1960s. In 2000, Grace agreed to pay the major portion of a $15.5 million settlement against book distributor and former subsidiary Baker & Taylor.

The asbestos suits, however, were a different kind of legal action. For one thing, there were more of them; for another, they dealt not only with damage done, but with potential injury as well. The trouble had been brewing for a while. As far back as 1985, Matthew Schifrin reported in Forbes that gypsum suppliers, including W.R. Grace as well juggernaut USG, could expect a flood of litigation in the wake of a high-profile personal injury suit related to asbestos, and in fact the first asbestos-related suit had been filed against Grace in 1982. In 1994, Grace settled charges of violating asbestos standards at its Libby, Montana tremolite mine, for over half a million dollars; in 2000, the EPA ordered Grace to spend an additional $5 million to clean up the site. Then, in 1999, Grace was party to a $200 million settlement to residents of Cook County, Illinois, who were exposed to asbestos in the 1960s and 1970s.

On October 5, 2000, Owens Corning, the United States' largest building materials manufacturer, filed for bankruptcy. While this did not affect Grace's fortunes directly, it did cause a general fall in stock prices among companies with asbestos liability--including Grace. More serious, however, was how removal of players from the field affected those remaining; as Merrill Lynch analyst Karen Gilsenan put it in Chemical Market Reporter, "Grace and the other remaining players could face increased liability ... co-defendants in many of these cases could end up shouldering a larger part of the financial burden." As of June 30 that year, Grace was named in over 53,000 asbestos lawsuits and had paid out a total of $1.15 billion in judgments and settlements. By April of the following year, that amount had risen to $1.9 billion, and the number of personal injury claims against the company topped 325,000.

By early 2001, Grace's stock price had fallen to under $2 a share, and President and CEO Norris admitted in the company's fourth-quarter conference call that Grace was reviewing the choice of actions available, and that "these include ... resolving our asbestos liability through a reorganization under Chapter 11." The decision was not long in coming; Grace filed for Chapter 11 on April 2, 2001. The filing included 61 of Graces 70 domestic subsidiaries, but none of its foreign subsidiaries.

Grace's troubles did not end there. An investigation related to the filing looked into whether Grace's massive divestitures in the 1990s, particularly National Medical Care and Cryovac, were meant to shield the assets tied up in these companies from asbestos liabilities. Atlanta attorney Sally Weaver noted in an affidavit related to the Libby case, "the asbestos liability faced by W.R. Grace & Co. was sufficiently large to constitute a strong inducement to insulate the company's assets."

Grace acted immediately to keep the company afloat, acquiring $250 million in financing to maintain day-to-day operations. The company also created the position of chief restructuring officer, naming Senior Vice-President and General Counsel David Siegel to the post. In fact, the outlook for Grace was generally considered good; Norris was quoted in Chemical Week as saying that "We are confident that once we can finally resolve this difficult issue, the company can emerge from reorganization as a strong, financially sound enterprise." And analyst Fred Siemer told Adhesives Age that "Grace is a really strong company ... the lawsuits simply got out of hand. The courts will set up a payment schedule, and Grace will meet it." Some saw the situation as

illustrative of a fundamental imbalance between business and law; consultant Stephen Einhorn told the same publication that "W.R. Grace is another example of how the legal profession is in a battle with the business world for survival." Lehman Brothers analyst Timothy Gerdeman agreed, saying that "Grace is an excellent company, possessing an attractive portfolio, solid management, and solid cash flow, but it is a victim of the U.S. legal system." There seemed little doubt, despite the overwhelming volume of lawsuits and the bankruptcy filing, that the company that had persisted for 150 years would continue, and perhaps even thrive.

Principal Subsidiaries:Grace Performance Chemicals; Grace Davison Chemicals; Gloucester New Communities; Grace Logistics Services.

Principal Competitors:BASF AG; DuPont; Engelhard; Cytec Industries; GenTek Incorporated; Great Lakes Chemical Corporation.

Chronology

Key Dates:

- 1854: William Russell Grace becomes a partner in Bryce, Grace & Co., in Peru.
- 1865: The company, now called W.R. Grace & Co., moves to New York.
- 1899: W.R. Grace & Co. incorporates.
- 1904: Death of William Grace. His brother, Michael, succeeds as chairman.
- 1914: Grace National Bank established. Grace sends first commercial ship through Panama Canal.
- 1945: J. Peter Grace, grandson of William, becomes president of W.R. Grace & Co.
- 1953: W.R. Grace & Co. lists on New York Stock Exchange.
- 1954: Grace acquires Davison Chemical Company and Dewey & Almy Chemical Company. Cryovac spins off from Dewey & Almy as a separate subsidiary.
- 1958: Grace constructs Washington Research Center, a chemicals research facility in Maryland.
- 1960: Grace introduces Cryovac Type L shrinkwrap for meat and poultry.
- 1963: Grace introduces pellet silica gel for use as a packaging desicant.
- 1964: Grace Davison introduces XZ-15, a catalyst that increases gasoline efficiency.
- 1965: Grace introduces Bituthene waterproofing membrane, replacing paint-on waterproofing.
- 1968: Grace introduces Cryovac Market-Ready packaging for beef and Monokote spray-on fireproofing.
- 1972: Grace Davison introduces CO Combustion Promoter Additive.
- 1978: Grace introduces Ice & Water Shield for roofing.
- 1979: Grace introduces Darex Corrosion Inhibitor for concrete.
- 1984: Grace introduces Cryovac cook-in bags for institutional cooking.
- 1985: Grace acquires Chomerics, Inc., a packaging and coating manufacturer.
- 1986: Grace settles with eight Woburn, Massachusetts families in a water pollution case.
- 1987: Grace becomes first wholly foreign-owned company to do business in the People's Republic of China.
- 1991: Grace announces major restructuring plan, to culminate in a company with two lines of business, instead of dozens.
- 1992: First asbestos-related lawsuit is filed against W.R. Grace.
- 1993: J. Peter Grace retires as CEO of W.R. Grace & Co. and is succeeded by J.P. Bolduc. Grace introduces beer bottle seals that help retain freshness without preservatives.
- 1994: Grace settles out of court regarding the violation of Clean Air Act asbestos standards near Libby, Montana.
- 1995: J. Peter Grace dies at age 82; Balduc resigns. Albert J. Costello is named president, chairman, and CEO. Grace is challenged on its patent of its extraction of natural pesticide from Indian neem trees.
- 1996: Grace divests extensively, streamlining the company to six core businesses. Merchant Adventurer, a long-suppressed biography of William Grace, is published by S.R.
- 1998: Cryovac merges with Sealed Air Corporation. Grace streamlines further, to two essential businesses: specialty chemicals and container products.
- 1999: Paul Norris becomes chairman. Grace relocates headquarters from Boca Raton, Florida, to Columbia, Maryland.
- 2000: Grace makes acquisitions in keeping with its new focus, including Crosfield Groups, International Protective Coatings, Hampshire Polymers, and more.
- 2001: Grace files for Chapter 11 on April 2. The company acquires $250 million in financing to continue day-to0day operations, and names senior executive David Siegel to the newly-created position of chief restructuring officer.

Born June 15, 1937 (age 83) in San Antonio, Texas, United States

Alma mater California Institute of Technology / Stanford University

Scientific career

- **Fields** Physics
- **Institutions**
  - Air Force Weapons Laboratory
  - Rand Corporation
  - NASA
- **Thesis**

- *Electro-optical generation of electromagnetic radiation* (1963)

William Robert Graham (born June 15, 1937) is an American physicist who was chairman of President Reagan's General Advisory Committee on Arms Control from 1982 to 1985, a deputy administrator and acting administrator of NASA during 1985 and 1986, and director of the White House Office of Science and Technology Policy and concurrently science adviser to President Reagan from 1986 to 1989. He then served as an executive in national security-related companies.

Born in San Antonio, Texas, Graham received a B.S. degree in physics from the California Institute of Technology with Honors in 1959. In addition, he earned an M.S. degree in engineering science in 1961, and a PhD in electrical engineering in 1963, both from Stanford University.

Graham served three years active duty as a project officer with the Air Force Weapons Laboratory at Kirtland Air Force Base, Albuquerque, New Mexico, directing a group conducting experimental and theoretical research on strategic system survivability. Graham later spent six years with the Rand Corporation in Santa Monica, California, and jointly founded R&D Associates in 1971.

In 1980, Graham served as an adviser to presidential candidate Ronald Reagan and was a member of the President-elect's transition team. From 1982 to 1985, he served as chairman of the General Advisory Committee on Arms Control and Disarmament, having been nominated by the President and confirmed by the Senate in 1982. While chairing the General Advisory Committee, he led the preparation of the report "A Quarter Century of Soviet Compliance Practices Under Arms Control Commitments: 1958-1983", which was submitted to the President and to Congress in 1984.

On September 12, 1985, Graham was nominated by President Reagan for the position of Deputy Administrator of NASA. He was confirmed by the United States Senate on November 18, and sworn in on November 25, 1985. For a period from December 4, 1985, to May 11, 1986, Graham served as acting Administrator of NASA following the resignation of James M. Beggs. It was on his watch as acting administrator that the Space Shuttle *Challenger* was launched in frigid weather, causing o-rings to fail and destroy the ship. Graham left NASA on October 1, 1986, to become director of the White House Office of Science and Technology Policy (OSTP). On October 16, 1986, he was sworn in as director of OSTP and concurrently as science adviser to President Reagan, positions he held until June 1989, when he left government service to join Jaycor, a high-technology company headquartered in San Diego, California. He later served as the chairman and CEO of National Security Research, Inc. from 1997 to 2005.

Graham has also been a consultant to the Office of the Secretary of Defense and served on many international and national boards and advisory groups, including the National Academy of Science/National Research Council Committee on Undersea Warfare and Board on Army Science and Technology, the Air Force Science Advisory Board Task Force on Manned Strategic System Vulnerability, the U.S.-U.K. Joint Working Group on Atomic Weapons, the Defense Nuclear Agency Scientific Advisory Group on Effects, and the Defense Science Board System Vulnerability Task Force and Associated Task Forces. He was a member of the Defense Science Board from 2001 through 2008 where he led several studies, and was also a member of the State Department's International Security Advisory Board from 2006 through 2008.

In 1998 Graham served on the Rumsfeld Commission, which investigated the ballistic missile threat to the United States for the Congress, and in 2000 served on the Commission to Assess United States National Security Space Management and Organization, also mandated by Congress. He chaired the statutory Commission to Assess the Threat to the United States from Electromagnetic Pulse (EMP) Attack from 2001 through 2008, which issued several reports, including a report entitled "Critical National Infrastructures" in 2008.

EMP Warnings

Graham warned several times about the dangers of a nuclear electromagnetic pulse attack (EMP).

In a Congress hearing in 2008 he affirmed that about 90 percent of the US population could perish during such an attack: "We think that is in the correct range. We don't have experience with losing the infrastructure in a country with 300 million people, most of whom don't live in a way that provides for their own food and other needs. We can go back to an era when people did live like that. That would be - 10 percent would be 30 million people, and that is probably the range where we could survive as a basically rural economy."[1]

In a 2017 article he warned about the strategic significance of North Korean satellites' ability to generate an EMP attack, as well as widespread ignorance about an EMP.[2]

GSE Systems, Inc. develops and markets software-based simulation and training products to nuclear, oil, and gas electricity generators, and the chemical process industries. It also sells software for monitoring and optimizing plant and signal analysis to the power industry.

GSE Systems was established in 1994 from three simulation companies that came together. They were part of an original heritage from Singer-Link where they were involved in high-intensity simulation applications such as flight simulators. Since 1994 the company has grown through acquisitions. The primary businesses continue to be process control focused in the chemical, pharmaceutical and food industry, and simulation, which is also focused on fossil and nuclear simulation.

GSE Systems is headquartered in suburban Baltimore, Maryland. Global operations are conducted from offices in Sykesville (Maryland), Nyköping (Sweden), Beijing (China), Stockton-on-Tees (UK), and Chennai (India).

Timeline:

1929 Edwin Albert Link invents and patents the first Link Trainer, forms Link Aeronautical Corporation in Binghamton, NY.

1930 Link Flying School organized in Binghamton.

1933 Link Aeronautical Corporation moves to Endicott, NY to maintain the flight school, repair airplanes, and operate charter flights.

1934 Link Aeronautical Corporation returns to Binghamton.

1935 Link Aviation Devices, Inc. is formed in Binghamton, NY to manufacture trainers etc. Link Aviation Devices, Inc. renamed Link Aviation, Inc.

1937 Link Manufacturing Company Limited is formed in Gananoque, Ontario to build trainers for Canadian and UK customers.

1953 Ed Link steps down as president of Link Aviation.

1954 Ed and George Link sell Link Aviation to General Precision Equipment Corporation.

1956 Link Aviation acquires a controlling interest in Air Trainers Limited of England and changes its name to Air Trainers Link Limited.

1959 Ownership of Air Trainers Link Limited is transferred to the parent company, GPE, and the name changes to General Precision Systems Ltd.

1965 GPE buys the operations of the Riverdale, MD plant of Electronics Division of ACF Industries (previously ERCO) and moves it to Silver Spring, MD.

1967 Redifon, a member of Rediffusion, buys Air Trainers Link Ltd. and renames it Redifon Air Trainers Ltd.

1968 Singer Corporation acquires GPE. Edwin Link remains as consultant until 1972.

1984 Simuflite Training International Inc. is founded by Singer.

1987 Singer's Link Division is incorporated as Link Corporation.

1988 Paul A. Bilzerian buys Singer Corporation

1988 Paul A. Bilzerian buys Singer Corporation.

1988 CAE Industries, Ltd. buys Link Corporation of Silver Spring, MD.

1988 Singer's simulation manufacturing business is reorganized under the name of LinkMiles with two companies: Link-Miles Limited located in Lancing, England and LinkMiles International Simulation Corporation based in Binghamton, NY.

1989 Singer is renamed Bicoastal Corporation.

1989 Bicoastal Corporation files Chapter 11 bankruptcy.

1990 Link-Miles Simulation Corporation of Columbia, MD is renamed S3 Technologies.

1990 Thomson-CSF of France buys Link-Miles Limited, merges it with Redifussion Simulation, and renames it Thomson Training & Simulation.

1992 Bicoastal Corporation is dissolved.

1993 ManTech International buys S3 Technologies.

1995 Hughes Electronics Corporation buys CAE-Link.

1994 GSE Systems (Global Simulation & Engineering Systems) absorbs S3 Technologies.

Major Milestones:

In 2011, Construction of Westinghouse AP1000 nuclear power plant simulator, a first-of-a-kind project

In 1977, GSE was a pioneer provider of high-fidelity refinery and fossil power plant simulators. Since then, GSE has built more full-scope simulators than all of its competitors combined.

In 1971, GSE Systems, then Link Simulation, built the first commercial full-scope nuclear power plant simulator.

Major Acquisitions:

GSE Systems Acquires EnVision Systems, Inc in the year 2011. EnVision Systems, Inc. ("EnVision"), which provides interactive multi-media tutorials and simulation models, primarily to the petrochemical and oil & gas refining industries. EnVision, with headquarters in Madison, NJ and an office in Chennai, India, was founded in 1991. EnVision's tutorials and simulation models serve the rapidly growing entry-level training market for the oil & gas refining and specialty chemicals industries. EnVision's products provide a foundation in process fundamentals and plant operations and interaction. With this knowledge base, users may then graduate to the full-scope, high-fidelity, real-time simulators provided by GSE. EnVision has completed more than 750 installations in over 28 countries and its approximately 130 clients include Shell Oil Company, BP, Total and Chevron.

Source document : [HW0008][GDrive]

Link Aviation Beginnings

In 1929 Edwin Albert Link, Jr. (1904–1981) invented the Link Trainer, a flight simulator that taught pilots how to fly by instruments (as opposed to watching the ground)1; his brother George Theron Link (1897–1979) is sometimes cited as a co-inventor. The initial patent application was submitted April 14, 1929 for the "pilot maker" flight trainer. Patent 1,825,462 was filed March 12, 1930 by E. A. Link, Jr. and granted September 29, 1931. Shortly thereafter he formed the Link Aeronautical Corporation in Binghamton, NY to market the trainer. In 1934 he demonstrated the value of instrument flying to a group of Army officers, after which the Army Air Corps ordered six of his trainers. By the time the order was completed other orders started coming in.

The rapid acceptance of Link Trainers and their continued development, due chiefly to the threat of war in Europe and Asia, made it necessary for Link to reorganize and expand his enterprises. In 1935 Link Aviation Devices, Inc., later renamed Link Aviation, Inc., was established to manufacture trainers and other aviation instruments. Link Aeronautical Corp., situated at the Tri-Cities Airport in Endicott, NY by 1933, maintained the flight school, an airplane repair service, and operated charter flights, but returned to Binghamton in December 1934. And Link Manufacturing Company, Ltd. was established in 1937 in Gananoque, Ontario to build trainers for Canadian and UK customers (British contracts required that their trainers be manufactured within the British Commonwealth).

By 1940 trainers had been shipped to over thirty-five countries around the world. In the early 1950s, **Link Aviation was buoyed by the acceptance of simulators by commercial airlines and an increase in military expenditures caused by the Korean War. The company continued to develop aviation simulators and trainers, including all of NASA's manned spaceflight simulators**, and came to dominate the military training and simulation industry.

By the mid-1950s Link Aviation was enjoying financial and managerial stability. While others took up the innovations begun by Ed Link leaving him with less involvement and while the business aspects became increasingly complicated, Ed's interests began to shift. In 1953 he stepped down as president of the company, and took the less active position of Chairman of the Board. Ed believed that to ensure the survival of Link Aviation in an increasingly competitive market, he should merge the company with a larger, more diverse corporation. **In 1954 he and his older brother George Link sold Link Aviation to General Precision Equipment Corporation (GPE), a large holding company.**

That sale marked the beginning of a long period of changes in ownership, during which the Link name would be applied to other organizations, both officially and casually. **In 1968 Singer Corporation acquired GPE. Twenty years later Singer was subject to a hostile takeover and dismantled.**

Edwin Link was president of Link Aviation until 1953 and board chairman until its merger with the General Precision Corporation in 1954. He was president and a director of General Precision until its merger with the Singer Company of Stamford, CT in 1968; he retained chairmanship of Link Aviation while Hermann Place retained chairmanship of GPE. Thereafter, he became a consultant to Singer (1968–1972). After selling Link Aviation, Ed's interests shifted from above ground to underwater. He was fascinated by diving and underwater archaeology and invented a number of diving chambers for sea exploration.

The General Precision Equipment Era (1954–1968)

General Precision Equipment Corporation was headquartered in New York City, New York. GPE was founded June 1936 by Hermann Gauntlett Place as a holding company for a group of theater equipment firms. In addition GPE had a substantial stock interest in 20th Century Fox Film Corp. WWII "with its

holding company for a group of theater equipment firms. In addition GPE had a substantial stock interest in 20th Century Fox Film Corp. WWII "with its insatiable demands for the products of American industry" encouraged GPE, with capital to invest, to expand and diversify. Accordingly GPE acquired a number of other businesses beginning in 1941 including Librascope Development Company of Burbank, CA (later of Glendale, CA) in 1941, The Kearfott Company Inc. of Little Falls, NJ and Kearfott Manufacturing Corp. of Wayne, NJ in 1952, and Link Aviation of Binghamton, NY in 1954. In 1955 GPE was ranked 255 in Fortune's list of America's largest corporations. By 1956 the 21 member companies employed 12,000 people in 36 plants in 23 cities. Mr. Place was president and board chairman.

In January 1960 Librascope, Kearfott, General Precision Laboratory (GPL), and Link Aviation combined to form a new electronics firm known as General Precision, Inc. to position itself as a prime contractor on systems contracts. GPI's headquarters were in NYC as was GPE's. Each of the founding firms became a division of GPI. GPL was still a subsidiary of GPI in 1967 but had moved to GPS by 1968.

There was another subsidiary, General Precision Systems, which had a facility in Little Falls, NJ. By 1966 it held the Kearfott Group with its Kearfott Products Division. By 1967 it also held a Link Division.

After 1954 Link acquired controlling interests in two British firms, Air Trainers Limited in 1956 and Miles in 1969 (under Singer).

Air Trainers Ltd was formed in 1946 in Leighton Buzzard, Bedfordshire, apparently as successors to J.V.W. Corporation Ltd which, since 1936, had been importing and servicing the American-made Link trainers for the RAF. It moved to Aylesbury in 1946. **As well as manufacturing the Link trainer under license, the company pioneered the development of DC analog co**mputing techniques for flight simulators, the first of which was delivered to the RAF in 1953. By 1954 the workforce had grown to 500. In 1956 Link Aviation of New York acquired a controlling interest, Link president Allan Williford joined the Board of Air Trainers, and the name changed to Air Trainers Link Ltd. In 1959 the Link interest was transferred to the parent company, General Precision Equipment Corporation, and the name of the company changed to General Precision Systems Ltd. By 1963 there were 950 employees in Aylesbury occupying 120 000 square feet. In 1967 the firm was sold and became a subsidiary of Redifon Ltd, a member of the Rediffusion organization, and was renamed Redifon Air Trainers Ltd. In 1972 production was transferred to the Redifon Flight Simulator Division, Crawley, West Sussex.

In 1965 GPE purchased the operations of ACF's Electronics Division (previously ERCO) at the Riverdale plant and moved it to Silver Spring, MD. (There was more to the Electronics Division than the Riverdale plant.)

Link, as Link Group of General Precision Systems (GPS), had a facility in the defense and aerospace industry of Sunnyvale, CA from as early as 1967, if not before. Link Ordnance Div., General Precision, Inc. of Sunnyvale was cited by NASA as a major subcontractor of Boeing, one who played a major role in the development and production of the Saturn V launch vehicle; Link worked on the propellant dispersion systems.

The Singer Era (1968–1988)

In April 1968 Singer Corporation acquired GPE. Singer originally dropped the Link name, but after three years restored it as Singer-Link, or the Link Flight Simulation Division. During the Singer era Link reclaimed the type of dominance it enjoyed in the WW II period. At its peak, there were about 5000 employees of the Link Division worldwide including Binghamton, NY, Silver Spring, MD, Sunnyvale, CA, and Lancing, England.

ACF's Electronics Division in Silver Spring, MD, bought by GPE in 1965, was renamed Simulation Products Division in 1968. It was renamed Link Division in 1976.

In September 1969 Link bought Miles Electronics Limited of Lancing, Sussex, England and renamed it Link-Miles. Miles Electronics was a subsidiary of F. G. Miles Limited founded in 1948 by Frederick George Miles to produce aircraft. Miles Electronics was involved in the manufacture of flight simulators. US patent 3584429 dated 1971 was held by Link-Miles Limited.

In January 1981, the Singer company announced a split in the Link division:

- **Link Simulation Systems Division in Silver Spring, MD was chartered to promote growth in the fields of nuclear and fossil fuel, power plant simulation, industrial process plant simulation, tactical simulation, and for finding new opportunities in other simulation areas.**
- Link Flight Simulation Division with operations in Sunnyvale, CA, Houston, TX, Lancing, England, and Binghamton, NY was chartered to expand the company's business in the aircraft and spacecraft industries.

As early as 1982 the Link Simulation Systems Division had a facility in Columbia, MD. They built nuclear power plant simulators there. The headquarters remained in Silver Spring.

In 1984 Singer formed a new enterprise, Simuflite Training International Inc., to compete with Flight Safety International in the business aircraft pilot training market. Simuflite2 was located in Dallas, TX. It used simulators built by Singer-Link.

In January 1987 Singer split the Kearfott Division into Kearfott Guidance & Navigation Division located in Little Falls, NJ, which was sold to the Astronautics Corporation of America in 1988, and the Electronic Systems Division located in Wayne, NJ (originally Kearfott Manufacturing Corporation), which was sold to GEC-Marconi in 1990 and renamed GEC-Marconi Electronic Systems.

In December 1987, the Link Division was incorporated in Delaware as Link Military Simulation Corporation ("Link Corporation"), a wholly owned subsidiary of Singer. In that same month Singer converted the Kearfott Guidance & Navigation Division into a wholly owned subsidiary, which it named Kearfott Guidance & Navigation Corporation.

After Singer, Unstitched (1988 and later)

By 1987 Singer had gotten in financial trouble. It had enormous debt, a $20 million dollar loss, and its chairman died unexpectedly. In February 1988 it was purchased by Paul A. Bilzerian, a Florida financier known as a corporate raider, for $1.06 billion. He quickly began to sell off the pieces to pay his debt. He also moved the headquarters from Stamford, CT to Tampa, FL.

In April 1988 the Singer Link-Miles Simulation Corporation surrendered its incorporation in Delaware.

On August 5, 1988 Bilzerian sold Link Corporation in Silver Spring, MD (the old Link Aviation and ERCO groups) to the Canadian firm CAE Industries, Ltd. (previously known as Canadian Aviation Electronics Ltd.) who renamed it CAE-Link Corporation or Link Domestic Simulation and Training Systems Division. In 1995 CAE sold Link to Hughes Electronics Corporation for $155 million. Two more sales saw Link with L-3 Communications in 2000 (bought for $160 million), who restored the Link name; it now known as L-3 Link Simulation & Training and is located in Arlington, TX.

In September 1988 the Kearfott Guidance & Navigation Corporation was sold to Astronautics Corporation of America for $285 million.

On October 12, 1988 Bilzerian, Chairman and CEO of Singer, announced a reorganization of its simulator manufacturing businesses under the name Link-Miles, to consist of two autonomous operating companies, one in the United States and the other in the United Kingdom. The UK company, Link-Miles Limited, located in Lancing, England, was involved in the military flight, airline visual, naval, and ground simulation businesses worldwide. The US company combined the airline simulation activities of the Link-Miles International Simulation Corporation based in Binghamton, NY and the industrial process and power plant business of the Industrial Simulation Corporation3 located in Columbia, MD. [I have found references to Singer Link-Miles Simulation Corporation dated July 1989, so it is not clear how long the Singer name persisted.]

> "Link-Miles : 3 businesss units Link-Miles limited, Link-Miles International Similation Corporation, and Lin-Miles **Industrial Simulation Corporation located in Columbia, MD"**

In March 1989 the Singer Sewing Machine Division was sold to Semi-Tech Microelectronics of Canada for $289 million. This company was owned by James Henry Ting, whose business empire rose and fell meteorically. His Akai Holdings suffered greatly in the 1999 Asian financial crisis. By early 2000, most of his companies had stopped doing business, slid into bankruptcy, or been absorbed by other companies. Semi-Tech bondholders sued Ting in November 2001 for $578 million. Ting was arrested in 2003 in Hong Kong for falsifying the accounts of Akai to the tune of more than $38 million. The Singer sewing machine business and trademark were sold in 2004 to Kohlberg & Company.

In June 1989 Bilzerian resigned as chairman and CEO of Singer, hours after the Securities and Exchange Commission filed civil securities fraud charges against him for his takeover of Singer. Joseph J. Campanella continued as president and chief operating officer. (Bilzerian evenutally agreed to pay $55 million in fines, but had not done so by 2001 and was jailed.)

By August 1989 all that remained of Singer was Librascope in Glendale, CA, Simuflite in Dallas, TX, **Singer Link-Miles (U.S.) in Columbia, MD, and Singer Link-Miles Limited (U.K.) in Lancing, England. The domestic Link-Miles comprised Link-Miles Simulation Corporation in Columbia, MD and Singer Link-Miles Corporation in Binghamton, NY.**

On October 16, 1989 Bilzerian adopted the business name of Bicoastal Corporation. Later that year, in November, Bicoastal filed Chapter 11 bankruptcy in Tampa, FL. The company dissolved in 1992.

In May 1990 Link-Miles Simulation Corporation, the domestic simulator business in Columbia, MD, announced a joint venture named **General Energy Technologies** with **NPO Energia** of the Soviet Union. General Energy Technologies would be **a Soviet enterprise centered in Moscow and would provide Soviet and Eastern European simulation, training**, and engineering services in energy related fields including nuclear and fossil fuel power plants, and chemical processing.

In April 1990 Link-Miles Simulation Corporation of Columbia signed a contract to provide nuclear plant simulators to SYPRO of Sweden and Pennsylvania Power & Light Co. Link-Miles also won a contract for an ethylene plant simulator.

In August 1990 Link-Miles Simulation Corporation of Columbia, MD, a manufacturer of nuclear power-plant control room simulators, was renamed S3 Technologies. Before that it was Industrial Simulation Corporation, and even earlier, the Link Simulation Systems Division of Singer. In September 1993 ManTech International bought S3 Technologies.

GSE Systems (Global Simulation & Engineering Systems) was formed on March 30, 1994 to consolidate the simulation and related businesses of S3 Technologies, General Physics International Engineering & Simulation, and EuroSim (Sweden), each separately owned and operated by ManTech International Corporation, GP Strategies Corporation, and Vattenfall AB, respectively. GSE, originally headquartered in Columbia, MD in the offices of the old Link-Miles Simulation Corporation, was subsequently headquarted in Sykesville, MD. In October 2003 controlling interest was acquired by GP Strategies Corporation, whose principal operating subsidiary is General Physics Corporation (founded in 1966 by Robert W. Deutsch). In 2007 GSE Systems developed training solutions for the power, process, manufacturing, and government sectors worldwide. GSE Systems has subsidiaries.

In September 1990 Bicoastal sold Link-Miles Limited, the UK simulator manufacturer, to Thomson-CSF of France for $100 million. In 1994 Thomson bought Redifussion Simulation from Hughes Aircraft, merged it with Link-Miles, and renamed the company Thomson Training & Simulation; it was located at Crawley, West Sussex. In December 2000 Thomson-CSF changed its name to Thales and the Link-Miles-Rediffusion company was rebranded Thales Training & Simulation.

In September 1991 Simuflite was sold to Southern Air Transport, Inc. of Miami, FL. In January 1998 Simuflite was sold to General Electric Capital Services when SAT sold itself to Kitty Hawk Inc. In December 2001 CAE bought Simuflite for $247 million.

In December 1991 Librascope was sold to Loral Corp. for $9 million, the last piece of Singer to be sold. It was renamed Loral Librascope. In January 1996 Lockheed Martin acquired Loral including Librascope. On June 30, 2000 Librascope's Glendale, CA facility was closed, and its remaining business was moved to its parent Lockheed Martin division in Manassas, VA.

All the pieces of Link claim all of its history

ERCO

In 1930 Henry Berliner founded the **Engineering and Research Corporation (ERCO) in Washington, DC** to produce tools for the manufacture of metal aircraft and propellers. It was incorporated in MD in 1936. In 1937 it designed and produced the famous Ercoupe airplane. A plant was built in Riverdale, MD in 1938. An adjacent airfield named ERCO Field was built 1942–1943. A total of 112 Ercoupes were produced in Riverdale before the war forced the company to suspend production, thousands of Ercoupes were produced after the war until 1952. In 1949 ERCO built a flight simulator and entered the electronics field.

In November 1954 the Berliner family sold ERCO to American Car & Foundry Corporation (later known as ACF Industries, Inc.) for $3 million. ACF was a diversified manufacturing company whose products ranged from railroad equipment to nuclear power equipment. The ERCO operation was renamed as the ERCO Division, ACF Industries Inc. It remained in Riverdale, MD. In **1957 ERCO Division merged with ACF's Nuclear Energy Products Division (previously known as Albuquerque Division) and became known as Nuclear Products, ERCO Division.** The Riverdale plant served as the Nuclear Products Division Headquarters. The Nuclear Products group built a number of a nuclear power plants.

ACF's Electronics Division was in existence by 1962. I suspect that it encompassed the old ERCO Division without the nuclear group.

In 1965 GPE purchased the operations of ACF's Electronics Division at the Riverdale plant and moved it to Silver Spring, MD. After Singer's purchase of

GPE, the division was named Simulation Products Division. It had offices in Sunnyvale, CA until 1972 at the earliest that were used to design nuclear power plant simulators and flight simulators. It also had offices in Houston, TX and Binghamton, NY. In 1976 Singer Simulation Products Division was renamed Link Division.

Computer simulation firms announce merger

By Michael Dresser
Sun Staff Writer

Three Columbia-based companies and a Swedish firm are joining forces to create an international computer simulation company based in Columbia.

Simulation, Systems and Services Technologies Co., known as S3, agreed Friday to merge with EuroSim AB of Sweden and two Columbia-based units of National Patent Development Corp. to form a new company to be known as Global Simulation and Engineering Systems Inc. (GSE).

The new company, which will be housed in S3's Columbia headquarters, will be headed by S3 Chief Executive William E. Kuhlmann, a former General Physics Corp. president. Mr. Kuhlmann said yesterday that the merging companies now account for annual sales of about $55 million.

"We hope to do a public financing in the fall of this year, probably at the earliest," he said. The merger would help the companies make the transition from a hardware orientation to an emphasis on software, he said.

The existing companies are active in the creation of computer simulations of power generation operations, both for nuclear and fossil fuel plants, and chemical processing. The simulations are used both for training and the development of new procedures in those industries.

The merger of the three companies is not expected to result in any significant job losses, said S3 Vice President Michael Allocco.

S3's Columbia operation will continue to employ about 275 workers, and they will be joined by an estimated 50 to 60 workers from General Physics International Simulation and Engineering Inc. and GPC Simulation Services Division. For the short term, he said, the merging companies will be operated with their current management structure intact.

General Physics International is owned by General Physics Corp. of Columbia, which is itself owned by National Patent Development Corp. of New York. GPC Simulation Services is a General Physics spinoff that is now directly owned by National Patent, which will control three of the seven board seats in GSE.

ManTech International Corp. of Fairfax, Va., which owns S3, will control another three seats, while the Swedish firm will control one.

GSE Systems acquires Texas Instruments unit

Companies don't reveal deal's price tag

By Michael Dresser
Sun Staff Writer

GSE Systems Inc., a Columbia-based supplier of systems that simulate industrial processes, said yesterday that it has acquired a Hunt Valley business that could extend GSE's reach far beyond its stronghold in the power generation industry.

Under an agreement with Texas Instruments Corp. of Dallas, GSE will offer jobs to the 235 managers and other employees of TI's Process Systems business and continue doing business at its current location. GSE Systems will change the name of the business to GSE Process Solutions Inc.

The companies declined to reveal the price of the acquisition.

GSE Systems is the holding company for Columbia-based S3 Technologies, formerly the Link Simulation Systems division of the Singer Co. S3 Technologies is a leading provider of computer systems that simulate power generation processes, both for system design and employee training purposes.

The business that GSE is acquiring creates systems that do the actual work of controlling manufacturing and power generation process — running the automated machinery that formulates a medicine, for instance.

William Kuhlmann, GSE's chairman and chief executive, said the acquisition was part of a long-term strategy to expand the company's role in such industries as pharmaceuticals, foods and beverages, wastewater treatment and chemicals.

Michael Allocco, GSE's vice president for sales and marketing, said the two companies are "an absolutely very positive fit."

Mr. Allocco said about 80 percent of S3 Technologies' business comes from the power generation industry while 90 percent of the Process Systems' group's work comes from manufacturing processes.

And whereas S3 Technologies' business is 90 percent international, the Texas Instruments subsidiary's sales were 80 percent domestic, he said.

Mr. Allocco said the combined businesses will have an estimated $90 million in sales during the current fiscal year. He declined to provide any further breakdown.

Process Systems has been active in Hunt Valley under several owners since the late 1960s, he said. Originally named EMC Controls, it was owned by Rexnord Inc. until 1987, when it was sold to TI, he said.

With the addition of the Process Systems, GSE Systems will employ about 560 people worldwide, Mr. Allocco said. Besides S3 Technologies and GSE Process Solutions, the company also operates a Swedish subsidiary called EuroSim AB.

Privately held GSE Systems is 45 percent owned by ManTech International Corp. of Fairfax, Va., and 35 percent owned by National Patent Development Corp. of New York. Columbia-based General Physics Corp. and Vattenfall AB of Sweden each hold 10 percent stakes.

1995 (Aug 8) - GSE Systems' earnings boosted by acquisition

Source : [HN00QC][GDrive]

Boosted by the acquisition of a Hunt Valley software company, GSE Systems Inc. of Columbia yesterday reported that second-quarter earnings more than doubled as sales went up 91.6 percent.

The company, which makes computer programs to control industrial processes and simulate power plant controls and factory operations, reported quarterly earnings rose to $826,000, or 33 cents per share, compared with $375,000, or 15 cents per share, for the same period a year ago. Sales jumped to $22.8 million from $11.9 million.

The company's stock yesterday rose 25 cents a share to close at $15.50.

GSE Systems, which has 515 workers in Columbia and Hunt Valley, went public July 27 with the sale of 1.5 million shares of stock at $14 a share that raised $21 million.

Even though there has been some recent slowdown in manufacturing, GSE sees growth in its international business and among companies trying to modernize. "We still see the industry continuing to grow," said William E. Kuhlmann, GSE's chairman and chief executive officer.

Of the quarterly sales increase, $9.3 million came from the Process Solutions operation, which was bought by GSE from Texas Instruments Corp. in December for $8.8 million. The Baltimore County business produces computer software to control industrial processes.

The addition of the business also boosted revenues for the first six months by $16.8 million to $41.8 million -- 81.7 percent higher than the same period a year ago when sales were $23 million.

Net income for the first six months was $1.4 million, or 56 cents per share, compared to $854,000, or 34 cents a share, for the first six months of 1994.

GSE Systems targets $4.5 billion market

■ **Expansion:** *The Columbia-based successor of troubled S3 Technologies looks*

scattered among locations in Sweden, the United States and the rest of the world.

"It was truly an effort of a number of others who believed in our vision," said William E. Kuhlmann, GSE's

Unhappy with developments, some of S3's key employees bailed out to set up a competitor, GP International Engineering & Simulation at General Physics Corp., another Columbia company

beyond its nuclear niche toward a larger market for industrial control systems.

By Ross Hetrick
SUN STAFF

In 1993, S3 Technologies was a mess.

Its parent company was in Chapter 11 bankruptcy proceedings. Many of its best and brightest had jumped ship to a new firm. S3's own business — making software for nuclear power plant simulators — was bleeding red ink and the company itself was ripe for a foreign takeover.

What a difference two years makes.

Now, S3's successor, GSE Systems Inc., based in Columbia, is mapping out a strategy for expansion.

Shored up by an initial public offering in July that raised about $20 million, GSE is nearly debt-free, is making a profit and is moving into what it sees as a potential $4.5 billion market. It has a work force of about 545, with 220 in Columbia, 180 in Hunt Valley and the rest

chairman and chief executive officer, sitting in the company's imposing 155,000-square-foot brick and glass building in a Columbia business park. "One reason I'm here is to fulfill that vision."

The saga of GSE started in 1988 when S3's parent, the 140-year-old Singer Co., a defense contractor that had sold off its famous sewing machine operation in 1986, succumbed to a hostile takeover by Paul A. Bilzerian, a 37-year-old Tampa, Fla., corporate raider who planned to make a profit by selling off the company piecemeal.

S3, part of Singer's Link simulator division, specialized in making the software for multimillion-dollar replicas of nuclear power plant control rooms. These control systems, which stretch for 60 to 90 feet and cost from $6 million to $19 million, are not connected to reactors but to computers that simulate them.

But Mr. Bilzerian's plans went awry, and the company, renamed Bicoastal Corp., filed for Chapter 11 bankruptcy in 1989. Mr. Bilzerian was convicted of securities fraud in other deals not connected to Singer.

that provides professional services to utilities and government agencies.

And S3, now contending in a tougher international market, started cutting its bids — to the detriment of its bottom line. [*See GSE, 10C*]

GSE Systems targets $4.5 billion market

[GSE, from Page 1c]

At the same time, potential customers shied away because of the financial problems of its parent company. By 1993, S3 was ripe for picking by a foreign competitor.

Then ManTech International Corp. and Mr. Kuhlmann stepped into the picture.

ManTech, a privately held consulting and technical company in Fairfax, Va., with annual sales of about $300 million, was looking to expand its simulator business, then limited to desktop models. It retained Mr. Kuhlmann, 52, to give S3 the once-over, and he came away impressed.

ManTech went ahead with the deal, buying S3 for $5 million and installing Mr. Kuhlmann, a former consultant and chief executive of General Physics, as chairman and chief executive.

Critical to the deal was a state guarantee of $2 million worth of loans and its help getting financing from the Export-Import Bank of the United States.

"We probably couldn't have done it without the help of the state," Mr. Kuhlmann said.

ManTech then brought in the parent of General Physics, National Patent Development Corp., and EuroSim AB, a subsidiary of the Swedish government-owned utility Vattenfall AB, as partners in the newly named GSE Systems, with ManTech and National Patent each holding 45 percent and EuroSim 10 percent of the company's stock.

Rolf M. G. Falkenberg, the former president of engineering and executive vice president of Vattenfall AB, was installed as president and chief operating officer.

Strategic acquisition

Secure in its new ownership, GSE, mindful of the nuclear power industry's cloudy prospects, set its sights on building simulators for other industrial operations, ranging from oil pipelines to steel making.

To crack these markets, GSE acquired the process solutions division of Texas Instruments Corp. in December for $8.8 million.

Based in Hunt Valley, this division makes software for the control panels of industrial operations — known as process controls. Now, the division will be able to offer software for both real and simulated operations — something that is offered by few of its competitors, Mr. Kuhlmann said.

The acquisition also nearly doubled GSE's revenues to $41.8 million for the first six months of the year, compared with sales of $23 million for the same period a year ago.

With cost cutting — including laying off 30 to 40 workers — and the completion of money-losing contracts, the combined operations went from a pro forma loss of $7 million in 1993 to a profit of $1.6 million last year.

The company's balance sheet, however, still showed the effects of years of losses, with a corporate net worth, or stockholders' equity, of minus $3.5 million.

But the company's prospects of expanding its process control business while selling more simulators to industrial customers — a market it estimates at a potential $4.5 billion — enabled GSE to issue 1.5 million shares at the relatively high price of $14 a share.

The July 27 initial public offering of the GSE stock raised about $20 million and pushed the company's net worth up to $14.8 million, though it reduced ManTech's and National Patent's stakes to 28 percent each and EuroSim's to 6.3 percent. The stock closed yesterday at $14.

The investment banking firm that took GSE public, Prime Charter Ltd. in New York, expects the company to dominate the nuclear simulator business now that the main players are combined.

"They were knocking each other's heads off bidding on the same contracts in the utility industry," said Sylvan Schefler, chairman of Prime Charter. "And they were bidding it stupidly."

Alan H. Dorsey, director for research at Value Investing Partners Inc. in Westport, Conn., noted that GSE's predecessor firms built 114 of the 170 nuclear simulators in service. And he added that there are another 255 nuclear plants in the world still without simulators.

"Even though it sounds like an ugly business, it's a great business," said Mr. Dorsey, whose firm participated in the selling group that handled the stock offering.

"The core business has done well and should do well in the next couple of years," he said.

Eastern European prospects

Indeed, GSE is looking to Russia and the former Soviet bloc countries as new markets for nuclear simulators. And both Mr. Kuhlmann and Mr. Falkenberg believe the nuclear industry will be revived as power plants turn away from fossil-fuel plants that generate carbon dioxide.

Nuclear simulators are "our cash cow," Mr. Falkenberg said.

GSE also is banking on its process solutions division to break into the industrial market — something S3 tried unsuccessfully a few years ago.

"It gives us instant access to a customer base," Mr. Kuhlmann said. "Our customers are very excited about it."

The need for more industrial simulators is being fueled by the increasing complexity of the controls and the enormous expense of shutdowns caused by inexperienced operators. The $200,000 to $5 million it costs for an industrial simulator can be made up by fewer breakdowns, Mr. Kuhlmann said.

Mr. Dorsey said outside forces ranging from the Environmental Protection Agency to insurance companies also are adding to the pressures on companies to use simulators.

Yet while the markets seem right and the company is poised to cash in, it still is up to management to make it work, Mr. Dorsey said. "They've got to put up the numbers in the next 18 months."

'They pirated positions,' PEER director says

Report rips drug agency

■ Money intended to add agents misspent, watchdog panel says

By Beverly Pettigrew Kraft
Clarion-Ledger Staff Writer

Plans to intensify drug enforcement faltered when funding for more narcotics agents was spent for a new training academy and more bureaucracy, says a government watchdog report released Monday.

The Legislature allocated $25.3 million to pay for 112 new Mississippi Bureau of Narcotics positions over three years. But hiring for the new positions lagged and resignations increased.

In January, the agency had gained only 34 more officers and civilians, according to the report by the Joint Legislative Committee on Performance Evaluation and Expenditure Review.

The agency's arrest rate dropped during that time.

"It was an opportunity squandered," PEER Director Max Arinder said.

The report noted:

■ Recruiting was inadequate. Management decisions led to resignations.

■ The original proposal that called for more agents projected an increase of 502 arrests, but 275 fewer were recorded. The projection for an increase of 866 new cases turned into 446 cases.

■ The new training school cost the state nearly $21 more per student per day than the state academy.

Leadership of the Bureau of Narcotics convinced the Legislature in 1996 to increase agents. Funding was spread over the 1998-2000 fiscal years. Of the 112 new positions authorized, 87 were to be for agents and 25 for support staff.

Part of the money went for promotions and raises.

"They pirated positions from both enforcement support and field agents and used these to build up middle management," Arinder said.

The report covers the three-year term of Tom Blain. Blain resigned in January. Don Strange was appointed March 1.

Blain, who inherited the expansion proposal when he became director in February 1997, made 30 promotions and created 15 field agent supervisor positions from 13 agent and two staff positions. Blain went from 13 supervisors to 28.

Blain "increased the number of management personnel at the expense of field operations," the report said.

MBN "misled the Legislature in its FY 1999 and 2000 budget requests concerning the use of the requested

Bureau: Mismanagement 'fairly serious,' Sen. Bryan says

From 1A

funds" by saying in budget requests that money was being used to continue the three-year expansion plan," the report said.

House Appropriations Committee Chairman Charlie Capps, D-Cleveland, said, "I'm really disappointed that the Bureau of Narcotics has put this money into administration instead of put it out into agents in the field. That's what we appropriated it for."

The PEER report was sharply critical of Blain's actions. It says Blain's management changes "created a work environment that may have influenced 50 voluntary or forced resignations ... including 29 field agents and six field agent supervisors."

Arinder said Blain "created some absolutely terrible morale problems in the department the way he managed things. ...They had a turnover rate that just skyrocketed."

Blain said Monday that he had not read the report. He said he would comment until after he had time to study it, probably today.

Blain works as a law enforcement consultant for ManTech International Corp. in Gainesville, Va. The management technology company helped build the state's automated criminal records network. Blain worked on that project at the Department of Public Safety before he became MBN director.

PEER Committee member Sen. Hob Bryan, D-Amory, said, "I think the solution would be a new agency head, and that's already taken place.

"The overall picture was there was fairly serious mismanagement out there during the previous administration," Bryan said.

"I have confidence that the new director will do better, not merely in the particular areas PEER talked about, but in general management of the agency," Bryan said.

Strange said people with supervisory titles and pay weren't supervising agents.

"There was no first-level supervision short of being the captain in charge of the office," Strange said. "They used the rank provisions for pay enhancements.

"I didn't think it was a very good structure. I didn't think it was conducive to drug law enforcement," Strange said.

Strange got Personnel Board approval for his reorganization plans in late April, changing duties and salaries of 19 positions.

PEER called for MBN to conduct a needs analysis of personnel requirements by Sept. 1, 2001, and to design a comprehensive recruitment plan. Positions should be based on things such as population, drug patterns and complaints from law enforcement and citizens.

The report said the State Personnel Board should work with MBN to revise qualifications for all officer positions.

The Personnel Board approved some of Blain's personnel actions.

The PEER report said personnel actions not related to the legislatively approved expansion cost $161,607 in fiscal year 1998, $82,109 in 1999 and $90,677 in 1999.

MBN did not fill new positions in a timely manner, PEER said. "As of Jan. 31, the bureau had filled 125 of 180 sworn officer positions. This lack of sworn officers, especially the field agents, has significantly impacted the enforcement of drug laws statewide."

Money for positions that remained vacant was returned to the state general fund. MBN returned $2.5 million for the 1998 and 1999 fiscal years. It is projected to return $4.5 million for the 2000 fiscal year.

With 83 vacancies last fall, the Joint Legislative Budget Committee called for cutting $2.6 million . The Legislature this spring reallocated $1 million after Strange begged to hire more agents.

Strange said he now has about 133 agents, with plans to hire about 25 more within a month. His goal is 188 agents. About 10 of the agents who resigned during Blain's tenure have been rehired.

Richard Brooks, who was was forced to resign for communicating with legislators and news reporters about problems he saw at MBN, was reinstated July 1. Brooks would not comment.

Hinds County Sheriff Malcolm McMillin said he wasn't surprised at the report's criticisms.

"Every two or three weeks I'd have somebody coming in here telling me they were the new captain or the new major and they wanted to have a wonderful working relationship," McMillin said. "They didn't help me."

PEER told MBN to be cost effective in training. The school that Blain set up at Camp Shelby in Hattiesburg cost the state at least $70,059 more than the state academy. Three 50-day sessions cost $220,808, compared to $150,750 that it would have cost at the Mississippi Law Enforcement Officer Training Academy in Rankin County, the report said.

The report recommended using the Rankin County academy for general law enforcement training and limiting the MBN academy to specialized training .

The report also said allowing two civilians to carry firearms created potential liability because they did not have the training or job responsibilities to carry weapons.

PEER called for legislation to prevent civilians from carrying firearms. Strange said he prohibits anyone except sworn officers from carrying a weapon.

Defense spending boosts information technology sector

By Ross Kerber
GLOBE STAFF

Suddenly, it's flush times for the cluster of companies that build and run military computer networks and provide information technology to the Pentagon.

Traditionally, makers of weapons like jet fighters and missiles have been the big recipients of defense spending. But now, rising spending on information systems is boosting the fortunes of a sector better known for keeping track of corporate data like spare parts and payrolls.

Underway in recent years, the trend was accelerated by the government's response to Sept. 11.

Standing to gain are both traditional technology companies and those that specialize in defense logistics. They range from giants like Lockheed Martin Corp. and EDS to smaller companies like Dynamics Research Corp. of Andover. Northrop Grumman Corp.'s hostile bid for TRW Inc. aims to integrate the technology-services groups both have built in recent years, including 400 people at Northrop's TASC unit in Reading.

GLOBE PHOTO/AMY NEWMAN

Michelle Christian-Michel is a software engineer at Dynamics Research in Andover. Shares in the firm have roughly doubled since Sept. 10.

Some players have already cashed in on the sector's improving fortunes. ManTech International Corp., which supports spy agency and military communication systems, raised $115 million in an initial public offering last month. Last week, Virginia-based SRA International registered to sell stock

worth $86 million. On Tuesday Anteon International Corp., which has about 500 New England employees, raised $270 million in an initial public offering; another provider of classified computer networks, CACI International Inc., plans to sell more of its own shares soon.

More offerings may follow, on the theory that defense work offers computer companies a hedge against reduced technology spending by corporations and other organizations.

"These companies weren't of much interest to the public markets before, because they didn't have much growth," said CIBC analyst Stephen Murphy.

On average, the sector's revenue rose around 7 percent annually since 1997, Murphy said. But he expects it to grow at 10 percent annually through 2007, at a time when sales at other technology companies will lag

agreements about whether even the smallest components needed to be tested with the same scrutiny that weapons must meet. Ultimately, the Navy and contractor EDS persuaded Pentagon overseers to use commercial methods.

"You don't need to test every Cisco router and Dell computer," said a Navy spokesman. "If we'd done it in the typical way of Navy weapons-testing, it would have taken an inordinate amount of time."

Ultimately the system will replace 200 different legacy e-mail systems used by 400,000 service personnel.

Investors see the Pentagon's new information technology push as a boon for defense stocks. Shares in Dynamics Research of Andover, for instance, have roughly doubled since Sept. 10 on expectations of more work.

James Regan, chief executive of Dynamics Research, said the company's goal is to grow 15 percent a year for the next five

companies will lag.

"The Pentagon is going to be a relatively more important customer" for technology companies, said David Colton, a vice president at the Information Technology Association of America, whose members contract with both civilian and military agencies.

Standing to gain are traditional tech companies and those specializing in defense logistics.

The military's information technology budget includes both administrative work and systems used for intelligence gathering or targeting guided weapons. For fiscal year 2003, the Bush administration has requested $52 billion in federal information-technology spending, a $4 billion increase over 2002. The military is the single biggest technology customer in the federal government, accounting for half the federal technology budget.

The extra money would be split between the military and, on the civilian side, the broad area known as "homeland security." That includes linking databases, perhaps between civilian and intelligence agencies, and more spending on information-storage networks and cyber-security, said Mark Forman, an official at the Office of Management of Budget who oversees federal e-government efforts. In all, the administration seeks $379 billion for the military next year, a $48 billion increase, justified by the war on terrorism.

That doesn't include spending on secret networks used by intelligence agencies, a figure the government doesn't disclose.

These increases will mean more work for services firms, Forman said. In the past, federal agencies often designed their own computer networks, but lately the government has pressed managers to act like business executives and outsource these tasks by hiring contractors.

"We want to get agencies to act like buyers rather than [computer-system] integrators," Forman said.

Some critics say that, without new regulations, outsourcing could lead to overcharging. At congressional hearings on March 7, the Washington-based Project on Government Oversight blasted "taxpayer ripoffs" stemming from lax procurement rules.

Bureaucratic problems have also cropped up. Last summer, payments for the largest systems

percent a year for the next five years, both through acquisitions and by adding to the security-software and logistics contracts it has already won.

For instance, Dynamics Research built and supports an Air Force system that keeps track of the movement of spare parts, and another one that helps determine when to repair jet engines. The company employs 1,500 people, including 800 in Andover and elsewhere in Massachusetts.

Regan, who began a restructuring of the company when he joined in late 1999, said the company expects revenue to rise as high as $217 million this year, from $201 million in 2001, and for profit to increase as well. It still works on systems for the Internal Revenue Service and other civilian branches of government, but military technology will drive most of the growth, he said.

"We see more opportunity for us to make a contribution in that area," he said.

In Lexington, Raytheon Co. has been seeking to win more computer contracts as part of a broader push into homeland security, a move referred to internally as "Project Yankee." Company spokeswoman Kristen Giddens said it will emphasize integrating databases and software to protect networks and data. The company declined to project how much revenue such activities will generate.

Lockheed Martin, the largest government computer contractor, has organized its defense technology services business under a retired Army general, Emmett Paige, a vice president of operations at the company's Information Technology division in Seabrook, Md. Paige was previously chief executive of OAO Corp., a closely held company with sales of more than $200 million that Lockheed bought in December.

Lockheed Martin doesn't forecast technology services revenue either, said Paige, who added he expects technology spending within federal civilian agencies to grow just as quickly as on the military side. And when it comes to protecting information networks, there will be plenty more public spending to go around.

"Anything dealing with security, I expect to grow," he said.

July 2 2002 - Buys Aegis Research Corp.

Source : [HN001B][GDrive]

"The ManTech International Corporation, a military contractor that first sold shares to the public in February, has agreed to buy the closely held Aegis Research Corporation for $70 million in cash. Aegis Research provides technical support services for the Defense Department and the national intelligence community, ManTech said yesterday. The company is expected to have about $60 million in revenue this year. The acquisition will add about 2 cents a share to ManTech's 2002 earnings and about 13 cents next year, the company said. The acquisition is expected to close this month and will be paid for using the proceeds of ManTech's initial public offering, the company said."

2011 (Aug 4) - "Guardians of Internet Security Are Targts"

Source : [HN001C][GDrive]

By Somini Sengupta

LAS VEGAS — The Web site of ManTech International, a $2.6 billion computer security company that won a major F.B.I. contract, sells its services this way:

"Whether an intrusion is conducted by a skilled outsider with criminal intent, an adolescent hacker seeking a thrill or a disgruntled employee bent on revenge or espionage, the potential risks to the organization are enormous."

Last Friday, ManTech was that organization.

A band of Internet vigilantes calling itself Anonymous said it had sneaked into ManTech's computers to demonstrate the company's insecurity. The group released what it said were internal company documents and, in language that suggested the handiwork of an adolescent hacker seeking a thrill, taunted the company online: "It's really good to know that you guys are taking care of protecting the United States from so-called cyber threats."

ManTech is in good company. In recent months, several security firms and consultants have been hit by the very intruders they are hired to keep at bay.

Think of these companies as the new Pinkertons: Instead of taking on 19th-century outlaws in the Wild West, they are hired today to protect corporate and government data, including the most confidential intelligence information, across a vast virtual frontier. The string of embarrassing attacks on them demonstrates how vulnerable everyone is online, including those who are paid to be the protectors.

Many technology professionals who have long warned about such security risks say so-called hacktivist groups like Anonymous, which publicize their attacks to make a point, are the least worrisome of the many potential intruders out there.

"With the rise of hacktivism, now the people who break into you tell you they break into you," said Jeff Moss, founder of the Black Hat conference, which drew nearly 6,500 technologists, largely security professionals, to Las Vegas this week. "A little bit of public humiliation is going to go a long way in helping the security industry clean up."

Other times, the attackers are mysterious and more worrying entities, as in the case of the still unknown organization that in March breached the systems of RSA, whose electronic security tokens are used across many industries.

RSA's parent company, EMC, has said that replacing tokens and cleaning up the mess has cost it roughly $90 million so far this year. Hackers used information obtained in the RSA attack to break into Lockheed Martin, the largest military contractor in the country.

On Wednesday the security company McAfee said it had uncovered a campaign of computer break-ins at 72 organizations and companies worldwide. McAfee called it the handiwork of a nation-state intent on acquiring, among other things, American military designs. Military contractors in the United States made up a disproportionately large share of the companies selected — 12 in all.

Anonymous, for its part, has made it plain that it goes after defense and intelligence contractors to expose their security vulnerabilities, not for financial or strategic gain. Booz Allen Hamilton, a $5.6 billion company based in McLean, Va., that does computer security work for the Defense Department, was hit by the group in early July; the hackers released the e-mail addresses of 90,000 military personnel.

The most notorious breach of a security company came early this year after an executive at HBGary Federal, a relatively small consultant eyeing a government contract, boasted publicly of his ability to unmask the members of Anonymous. In response, hackers made off with a large trove of the company's e-mail messages and dumped them online, exposing details of its business transactions.

Greg Hoglund, who is the chief executive of HBGary, the parent company that owns a minority stake in HBGary Federal, said that the breach was the result of "a human mistake" and that his firm, along with other security companies, had fortified their systems since then.

"It was a wake-up call for the entire security industry," Mr. Hoglund said. "It probably needed to happen. I wish I didn't have to be the sacrificial lamb."

As unlikely as it may seem, HBGary Federal still has a contract to help an unnamed federal agency sniff out spies inside its organization. And HBGary continues to sell its software, intended to ferret out the circumstances of a network intrusion.

For its part, ManTech posted a vague statement on its site last Friday after the Anonymous attack, saying that it addresses threats to its information systems and pointing out the obvious: "All organizations attract cyber threats in our highly networked world."

An academic who studies computer security, who declined to be named because he consults for the government, described the Anonymous attacks on security companies in blunt terms: "They're pulling their pants down publicly."

The spate of attacks — and the fear of more — could actually end up buoying the fortunes of the global security industry. A nationwide survey of company technology managers, conducted by Forrester Research, found that computer security had increased as a share of the total information technology budget of companies, to 14 percent this year from 8.2 percent in 2007. Of those surveyed this year, 56 percent said it was a high priority to "significantly upgrade."

"The landscape is more menacing now," said Eve Maler, principal analyst for security and risk at Forrester. "Even the most experienced practitioners are in the process of upping their game."

All of the major defense and intelligence contractors have expanded their digital security wings in recent years. They are simply following the money. The business of security for government agencies is growing by an enviable 9 percent a year, according to the research firm Input/Deltek. Federal government contracts alone amount to over $9 billion today and are projected to grow to $13.3 billion by 2015. "Cybersecurity," Deltek concluded in a recent report, "is somewhat immune to spending and budget cuts."

For better or worse, said Jonathan L. Zittrain, a Harvard Law School professor, securing the Internet has been largely left to private players — and even government information is increasingly guarded by private companies, whose actions can be difficult to monitor and hold accountable.

"In the absence of larger public order, we've seen do-it-yourself approaches: the technologically savvy can configure their own firewalls, and corporations can try to buy security," he said. "But this can be as figuratively dicey as trying to get and maintain security contractors in Baghdad immediately following the fall of Saddam Hussein."

2010 (July 30) - First US AP1000 simulator contract for GSE

Source : [HI000G][GDrive]

GSE Systems announced that it had been awarded contracts worth over $7 million for nuclear power plant simulator work, including the construction of the first plant-specific Westinghouse AP1000 plant simulator in the USA.

The company announced a year ago that it had signed a contract with Westinghouse to model the central nuclear systems of the AP1000 pressurized water reactor for use by US customers. These code modules, it said, would be common to all American AP1000s and would help Westinghouse to demonstrate plant design and control room factors to regulators and potential buyers.

The rest of the systems to make finished simulators will vary in detail from plant to plant. The company noted that a simulator at each new build site is included in the scope of work between Westinghouse and its US customers.

Huge areas at Vogtle are already prepared for the reactors and necessary construction offices and material stocks (Image: Southern)

GSE has now announced the first plant-specific contract to construct an AP1000 simulator in the USA. This is to be for Southern Company's Vogtle site in Georgia, where preliminary site work has already started for the two AP1000 units, slated to begin operation in 2016 and 2017, subject to regulatory processes already underway. In February of this year, Vogtle units 3 and 4 became the first new nuclear power plant construction projects to be offered conditional loan guarantees by the US Department of Energy (DoE).

John Moran, CEO of GSE, commented: "For GSE, the contract for the first domestic AP1000 plant simulator marks the true start of the nuclear renaissance in America. Of the 25 applications formally filed with the NRC to build new reactor plants in the United States, 13 have selected the AP1000 design."

In September 2007, Westinghouse and its partners the Shaw Group received authorization to construct four AP1000 units China: two at Sanmen in Zhejian province and two more at Haiyang in Shandong province. Around that time, GSE was awarded a contract to construct a simulator at the Sanmen plant. In April 2008, GSE said that it had been awarded a multimillion dollar contract to initiate work on a simulator for the Haiyang plant.

That contract was based upon the Haiyang and Sanmen plants being almost identical designs. However, GSE said that as the Haiyang design progressed it deviated from Sanmen. The company said that it has now been awarded a contract to implement the "uncommon" design features of Haiyang in the simulator.

In April 2005, GSE agreed with Westinghouse GSE to cooperate on the development of AP1000 simulators as well as the "verification and validation" of the AP1000 human-machine interface, on which several phases of regulatory tests have been completed.

In addition to the Vogtle and Haiyang contracts, GSE said that it had been awarded a contract by the US Nuclear Regulatory Commission (NRC) to upgrade one of the simulators operated by the NRC at its Chattanooga Training Centre in Tennessee.

Former type Public

Industry Telecommunications

Fate Acquired by Bell Atlantic

Successor [Verizon Communications Incorporated]

Founded 1934; 86 years ago

Defunct 2000; 20 years ago

Headquarters Stamford, Connecticut, U.S.

Products Telephone, internet, television

Subsidiaries GTE Southwest / CODETEL / Verizon California / Verizon Florida / Verizon North / Verizon South / Hawaiian Telephone / Puerto Rico Telephone

GTE Corporation, formerly **General Telephone & Electronics Corporation** (1955–1982), was the largest independent telephone company in the United States during the days of the Bell System. The company operated from 1926, with roots tracing further back than that, until 2000, when it was acquired by Bell Atlantic; the combined company took the name Verizon.

The Wisconsin-based Associated Telephone Utilities Company was founded in 1926; it went bankrupt in 1933 during the Great Depression, and was reorganized as General Telephone in 1934.[2]In 1991, it acquired the third largest independent, Continental Telephone ([Contel Corporation]). It owned Automatic Electric, a telephone equipment supplier similar in many ways to Western Electric, and Sylvania Lighting, the only non-communications-oriented company under GTE ownership. GTE provided local telephone service to many areas of the U.S. through operating companies, much as American Telephone & Telegraph provided local telephone service through its 22 Bell Operating Companies.

The company acquired BBN Planet, one of the earliest Internet service providers, in 1997. *[**Note** - **"BBN Planet"** was an internet service provider created by **BBN Technologies, Incorporated**. However, the "BBN Planet" acquisition is actually for the entirety of **BBN Technologies, Incorporated**.]* That division became known as GTE Internetworking, and was later spun off into the independent company **Genuity [(See Genuity Incorporated (2000) - Note that the name "Genuity" is recycled from another Internet company GTE acquired in 1997 - See Genuity Incorporated)]** to satisfy Federal Communications Commission (FCC) requirements regarding the GTE–Bell Atlantic merger that created Verizon.[4]

requirements regarding the GTE-Bell Atlantic merger that created Verizon.[4]

GTE operated in Canada via large interests in subsidiary companies such as BC Tel and Quebec-Téléphone. When foreign ownership restrictions on telecommunications companies were introduced, GTE's ownership was grandfathered. When BC Tel merged with Telus (the name given the privatized Alberta Government Telephones (AGT)) to create BCT.Telus, GTE's Canadian subsidiaries were merged into the new parent, making it the second-largest telecommunications carrier in Canada. As such, GTE's successor, Verizon Communications, was the only foreign telecommunications company with a greater than 20% interest in a Canadian carrier, until Verizon completely divested itself of its shares in 2004.[5]

In the Caribbean, CONTEL purchased several major stakes in the newly independent countries of the British West Indies (namely in Barbados, Jamaica, and Trinidad and Tobago).[6][7][8]

Prior to GTE's merger with Bell Atlantic, GTE also maintained an interactive television service joint-venture called GTE mainStreet (sometimes also called mainStreet USA) as well as an interactive entertainment and video game publishing operation, GTE Interactive Media.[9][10][11]

History

In 1918, Wisconsin public utility accountants Sigurd L. Odegard, John A. Pratt, John F. O'Connell bought the Richland Center Telephone Company for over $30,000 in Wisconsin. In 1920, the three accountants formed Commonwealth Telephone Company as the parent of Richland Center Telephone. Odegard was named president, Pratt vice-president, and O'Connell secretary. In 1922, Clarence R. Brown took over as vice-president when Pratt left the company that year.[12]

Commonwealth Telephone expanded across southern Wisconsin, and made its first purchase outside the state later in the decade when it bought Belvidere Telephone Company in Illinois. It also acquired two electric utilities in Wisconsin. In 1926, the company bought Associated Telephone Company in Long Beach, California. Later that year, Commonwealth Telephone and Associated Telephone merged as Associated Telephone Utilities.

From 1926 to 1923, Associated Telephone Utilities bought over 300 telephone companies across the United States. During this time period, Associated Telephone Investment Company was created in 1930 as a branch of Associated Telephone Utilities. By 1933, both Associated Telephone Utilities and its branch went out of business due to financial losses.

General Telephone

In 1935, General Telephone Corporation was established with John Winn as president. The following year, the company created General Telephone Directory Company as a division. In World War II, General Telephone helped install phone service for military facilities. From 1946 to 1950, General Telephone obtained over 100,000 telephone lines and bought out Leich Electric Company.

General Telephone's holdings included 15 telephone companies across 20 states by 1951, when Donald C. Power was named president of the company under chairman and long-time GT executive Morris F. LaCroix, replacing the retiring Harold Bozell (president 1940 - 1951). Power proceeded to expand the company through the 1950s principally through two acquisitions.

In 1955, Theodore Gary & Company became a part of General Telephone and allowed the company to hold over 2 million telephone lines after the company merge. It also had a subsidiary, named the General Telephone and Electric Corporation, formed in 1930 with the Transamerica Corporation and British investors to compete against ITT.[13]

In 1959, Sylvania Electric Products merged into General Telephone and was renamed to General Telephone & Electronics Corporation (GT&E). Power also obtained the purchases of multiple companies. such as Lenkurt Electric Company, Inc and Peninsular Telephone Company. In 1960, GT&E International Incorporated was created as a branch company. Power was named C.E.O. and chairman in 1961, making way for Leslie H. Warner, formerly of Theodore Gary, to become president. Simultaneously, GT&E went on to buy Community Antenna Television providers.

In 1964, Western Utilities Corporation became part of GT&E. Additional purchases during the 1960s included Hawaiian Telephone Company and Northern Ohio Telephone Company. At the end of the decade, ten million GT&E phones were active.

In the late 1960s, GT&E joined in the search for a railroad car Automatic Car Identification system. It designed the KarTrak optical system, which won over other manufacturer's systems in field trials, but ultimately proved to need too much maintenance. In the late 1970s the system was abandoned.

After a 1970 bomb attack to the company's headquarters in New York City, the company relocated to Stamford, Connecticut for their new headquarters. In 1971 GT&E undertook an identity change and became simply GTE, while Sylvania Electric Products became GTE Sylvania.[14] The same year, Donald C. Power retired and Leslie H. Warner became chairman of the Board. Theodore F. Brophy was brought in as president.

In 1974, GTE joined American Telephone & Telegraph in a project to create satellite stations. A few years later, the company's international branch was replaced by a GTE products company in 1976. Their products company remained until 1979. In 1979, GTE purchased Telenet to establish a presence in the growing packet switching data communications business. GTE Telenet was later included in the US Telecom joint venture.

1980s

In December 1983 Vanderslice stepped down as the company's president and chief operating officer.

In April 1988, after the retirement of Theodore F. Brophy, James L. "Rocky" Johnson was promoted from his position as president and chief operating officer to CEO of GTE, he was appointed chairman in 1991.[15]

1990s

In April 1992, James L. "Rocky" Johnson retired after 43 years at GTE, remaining on the GTE board of directors as Chairman Emeritus. Charles "Chuck" Lee was named to succeed Johnson. In 1994, Lee sold the company's satellite provider, Spacenet, to General Electrics and Contel of Maine to Oxford Networks, which placed the company into a newly created subsidiary, Oxford West Telephone

Acquisition by Bell Atlantic

Bell Atlantic acquired GTE on June 30, 2000, and named the new entity [Verizon Communications Incorporated]. The GTE operating companies retained by Verizon are now collectively known as **Verizon West** division of Verizon (including east coast service territories). The remaining smaller operating companies were sold off or transferred into the remaining ones. Additional properties were sold off within a few years after the merger to

Century Tel, Alltel, and Hawaiian Telcom. On July 1, 2010, Verizon sold many former GTE properties to Frontier Communications.[16] Other GTE territories in California, Florida, and Texas were sold to Frontier in 2015 and transferred in 2016, thus ending Verizon's landline operations outside of the historic Bell Atlantic footprint.[17] Verizon still operates phone service in non-Bell System areas in Pennsylvania under Verizon North, and in non-Bell System areas in Virginia and Knotts Island, North Carolina under Verizon South.

Operating companies

Prior to the acquisition with Bell Atlantic, GTE owned the following operating companies in the US:[18]

- Contel of Minnesota, Inc.
- Contel of the South, Inc. (Alabama, Indiana, Michigan)
- GTE Alaska Incorporated
- GTE Arkansas Incorporated
- GTE California Incorporated (Arizona, California, Nevada)
- GTE Florida Incorporated
- GTE Hawaiian Telephone Company, Inc.
- GTE Midwest Incorporated (Iowa, Missouri, Nebraska)
- GTE North Incorporated (Illinois, Indiana, Michigan, Ohio, Pennsylvania, Wisconsin)
- GTE Northwest Incorporated (Idaho, Oregon, Washington)
- GTE South Incorporated (Illinois, Kentucky, North Carolina, South Carolina, Wisconsin)
- GTE Southwest Incorporated (Arkansas, New Mexico, Oklahoma, Texas)
- GTE West Coast Incorporated (California)

Following the acquisition with Bell Atlantic, some of these companies and/or access lines have been sold off to other companies, such as Alltel, ATEAC,[19] The Carlyle Group, CenturyTel, Citizens/Frontier Communications, and Valor Telecom.

Company History

[...]

In 1920 that principle was put into action, and the three accountants formed a corporation, Commonwealth Telephone Company, with Odegard as president, Pratt as vice-president, and O'Connell as secretary. Richland Center Telephone became part of Commonwealth Telephone, which quickly purchased telephone companies in three nearby communities. In 1922 Pratt resigned as vice-president and was replaced by Clarence R. Brown, a former Bell System employee.

By the mid-1920s Commonwealth had extended beyond Wisconsin borders and purchased the Belvidere Telephone Company in Illinois. It also diversified into other utilities by acquiring two small Wisconsin electrical companies. Expansion was stepped up in 1926, when Odegard secured an option to purchase Associated Telephone Company of Long Beach, California. **Odegard, with the assistance of Marshall E. Sampsell, president of Wisconsin Power and Light Company, and Morris F. LaCroix, a partner in Paine, Webber & Company in Boston, proceeded to devise a plan for a holding company, to be named Associated Telephone Utilities Company.**

That company was formed in 1926 to acquire Associated Telephone Company and assume the assets of Commonwealth Telephone. Sampsell was elected president of the new company, and Odegard and LaCroix were named vice-presidents. An aggressive acquisition program was quickly launched in eastern, midwestern, and western states, with the company using its own common stock to complete transactions.

During its first six years, Associated Telephone Utilities acquired 340 telephone companies, which were consolidated into 45 companies operating more than 437,000 telephones in 25 states. By the time the stock market bottomed out in October 1929, Associated Telephone Utilities was operating about 500,000 telephones with revenues approaching $17 million.

In January 1930 a new subsidiary, Associated Telephone Investment Company, was established. Designed to support its parent's acquisition program, the new company's primary business was buying company stock in order to bolster its market value. Within two years the investment company had incurred major losses, and a $1 million loan had to be negotiated. Associated Telephone Investment was dissolved but not before its parent's financial plight had become irreversible, and in 1933 Associated Telephone Utilities went into receivership.

The company was reorganized that same year and resurfaced in 1935 as General Telephone Corporation, operating 12 newly consolidated companies. John Winn, a 26-year veteran of the Bell System, was named president. In 1936 General Telephone created a new subsidiary, General Telephone Directory Company, to publish directories for the parent's entire service area.

In 1940 LaCroix was elected General Telephone's first chairman, and Harold Bozell, a former banker for Associated Telephone Utilities, was named president. Like other businesses, the telephone industry was under government restrictions during World War II, and General Telephone was called upon to increase services at military bases and war-production factories.

Following the war, General Telephone reactivated an acquisitions program that had been dormant for more than a decade and purchased 118,000 telephone lines between 1946 and 1950. In 1950 General Telephone purchased its first telephone-equipment manufacturing subsidiary, Leich Electric Company, along with the related Leich Sales Corporation.

Bozell retired in 1951 and Donald Power, a former executive secretary for Ohio Governor John Bricker, was named president. By the time Power took over, General Telephone's assets included 15 telephone companies operating in 20 states. During the 1950s Power guided the company in a steady, aggressive acquisition campaign punctuated by two major mergers.

In 1955 Theodore Gary & Company, the second-largest independent telephone company, which had 600,000 telephone lines, was merged into General Telephone, which had grown into the largest independent outside the Bell System. The merger gave the company 2.5 million lines. Theodore Gary's assets included telephone operations in the Dominican Republic, British Columbia, and the Philippines, as well as Automatic Electric, the second-largest telephone equipment manufacturer in the U.S. LaCroix and Power were to retain their positions in the merged company, but a month before the deal was closed, LaCroix died, and Power assumed the additional title of chairman.

In 1959 General Telephone and Sylvania Electric Products merged, and the parent's name was changed to General Telephone & Electronics Corporation (GT&E). The merger gave Sylvania--a leader in such industries as lighting, television and radio, and chemistry and metallurgy--the needed capital to expand. For General Telephone, the merger meant the added benefit of Sylvania's extensive research and development capabilities in the field of electronics. Power also orchestrated other acquisitions in the late 1950s, including Peninsular Telephone Company in Florida, with 300,000 lines, and Lenkurt Electric Company, Inc., a leading producer of microwave and data transmissions system.

In 1960 the subsidiary GT&E International Incorporated was formed to consolidate manufacturing and marketing activities of Sylvania, Automatic Electric, and Lenkurt, outside the United States. The following year, Leslie H. Warner, a former Theodore Gary executive, was named president. Another former Theodore Gary executive, Don Mitchell, was named to the new position of vice-chairman, while Power remained chief executive officer and chairman.

During the early 1960s the scope of GT&E's research, development, and marketing activities was broadened. In 1963 Sylvania began full-scale production of color television picture tubes, and within two years it was supplying color tubes for 18 of the 23 domestic U.S. television manufacturers. About the same time, Automatic Electric began supplying electronic switching equipment for the U.S. defense department's global communications systems, and GT&E International began producing earth-based stations for both foreign and domestic markets. GT&E's telephone subsidiaries, meanwhile, began acquiring community-antenna television systems (CATV) franchises in their operating areas.

In 1964 Warner orchestrated a deal that merged Western Utilities Corporation, the nation's second-largest independent telephone company, with 635,000 telephones, into GT&E. The following year Sylvania introduced the revolutionary four-sided flashcube, enhancing its position as the world's largest flashbulb producer.

Warner assumed the additional title of chief executive officer in 1966, while Power remained chairman. Acquisitions in telephone service continued under Warner during the mid-1960s. Purchases included Quebec Telephone in Canada, Hawaiian Telephone Company, and Northern Ohio Telephone Company and added a total of 622,000 telephone lines to GT&E operations. By 1969 GT&E was serving ten million telephones.

In March 1970 GT&E's New York City headquarters was bombed by a radical antiwar group in protest of the company's participation in defense work. In December of that year the GT&E board agreed to move the company's headquarters to Stamford, Connecticut. Power retired in 1971, and Warner was named chairman and chief executive officer. The following year Theodore F. Brophy was named president.

After initially proposing to build separate satellite systems, GT&E and its telecommunications rival, American Telephone & Telegraph Co., announced in 1974 joint venture plans for the construction and operation of seven earth-based stations interconnected by two satellites. That same year Sylvania acquired name and distribution rights for Philco television and stereo products. GTE International expanded its activities during the same period, acquiring television manufacturers in Canada and Israel and a telephone manufacturer in Germany.

Warner retired in 1976 and Brophy was named to the additional post of chairman. Brophy, soon after assuming his new position, reorganized the company along five global product lines: communications, lighting, consumer electronics, precision materials, and electrical equipment. GTE International was phased out during the reorganization, and GTE Products Corporation was formed to encompass both domestic and foreign manufacturing and marketing operations. At the same time, GTE Communications Products was formed to oversee operations of Automatic Electric, Lenkurt, Sylvania, and GTE Information Systems.

Thomas A. Vanderslice was elected president and chief operating officer in 1979, and another reorganization soon followed. GTE Products Group was eliminated as an organizational unit and GTE Electrical Products, consisting of lighting, precision materials, and electrical equipment, was formed. Vanderslice also revitalized the GT&E Telephone Operating Group in order to develop competitive strategies for anticipated regulatory changes in the telecommunications industry.

GT&E sold its consumer electronics businesses, including the accompanying brand names of Philco and Sylvania in 1980, after watching revenues from television and radio operations decrease precipitously with the success of foreign manufacturers. Following AT&T's 1982 announcement that it would divest 22 telephone operating companies, GT&E made a number of reorganizational and consolidation moves.

In 1982 the company adopted the name GTE Corporation and formed GTE Mobilnet Incorporated, to handle the company's entrance into the new cellular telephone business. In 1983 GTE sold its electrical equipment, brokerage information services, and cable television equipment businesses. That same year, Automatic Electric and Lenkurt were combined as GTE Network Systems.

GTE became the third-largest long-distance telephone company in 1983 through the acquisition of Southern Pacific Communications Company. At the same time, Southern Pacific Satellite Company was acquired, and the two firms were renamed GTE Sprint Communications Corporation and GTE Spacenet Corporation, respectively. Through an agreement with the Department of Justice, GTE conceded to keep Sprint Communications separate from its other telephone companies and limit other GTE telephone subsidiaries in certain markets. In December 1983 Vanderslice resigned as president and chief operating officer.

In 1984 GTE formalized its decision to concentrate on three core businesses: telecommunications, lighting, and precision metals. That same year, the company's first satellite was launched, and GTE's cellular telephone service went into operation; GTE's earnings exceeded $1 billion for the first time.

James (Rocky) L. Johnson, a former senior vice-president, was named president and chief operating officer in 1986. That same year, GTE acquired Airfone Inc., a telephone service provider for commercial aircraft and railroads, and Rotaflex plc, a United Kingdom-based manufacturer of lighting fixtures.

Beginning in 1986 GTE spun off several operations to form joint ventures. In 1986 GTE Sprint and United Telecommunication's long-distance subsidiary, U.S. Telecom, agreed to merge and form US Sprint Communications Company, with each parent retaining a 50 percent interest in the new firm. That same year, GTE transferred its international transmission, overseas central office switching, and business systems operations to a joint venture with Siemens AG of Germany, which took 80 percent ownership of the new firm. The following year, GTE transferred its business systems operations in the United States to a new joint venture, Fujitsu GTE Business Systems, Inc., formed with Fujitsu Limited, which retained 80 percent ownership.

Johnson succeeded Brophy as chairman and chief executive officer in 1987 and then relinquished his president's title the following year to Charles R. Lee, a former senior vice-president. Johnson continued to streamline and consolidate operations, organizing telephone companies around a single national organization headquartered in the Dallas, Texas, area.

In 1988 GTE divested its consumer communications products unit as part of a telecommunications strategy to place increasing emphasis on the services sector. The following year GTE sold the majority of its interest in US Sprint to United Telecommunications and its interest in Fujitsu GTE Business Systems to Fujitsu.

In 1989 GTE and AT&T formed the joint venture company AG Communication Systems Corporation, designed to bring advanced digital technology to GTE's switching systems. GTE retained 51 percent control over the joint venture, with AT&T pledging to take complete control of the new firm in 15 years.

With an increasing emphasis on telecommunications, in 1989 GTE launched a program to become the first cellular provider offering nationwide service and introduced the nation's first rural service area, providing cellular service on the Hawaiian island of Kauai. The following year GTE acquired the Providence Journal Company's cellular properties in five southern states for $710 million and became the second largest cellular-service provider in the United States.

In 1990 GTE reorganized its activities around three business groups: telecommunications products and services, telephone operations, and electrical products. That same year, GTE and Contel Corporation announced merger plans that would strengthen GTE's telecommunications and telephone sectors.

Following action or review by more than 20 governmental bodies, in March 1991 the merger of GTE and Contel was approved. Johnson and Lee maintained their positions as chairman and president, respectively, while Contel's Chairman [Charles Wohlstetter (born 1910)] became vice-chairman of GTE. Contel's former president, Donald Weber, agreed to remain with the company during a six-month transition period, before leaving the merged company.

Contel Corporation's earliest predecessor, Telephone Communications Corporation, was founded by [Charles Wohlstetter (born 1910)]. After working as a Wall Street runner in the 1920s and as a Hollywood screenwriter in the 1930s, Wohlstetter returned to Wall Street in the 1940s and became a financier. In 1960 he made what he would later call a bad investment in an Alaskan oil company that would become the impetus for Contel.

To help turn that investment around, [Charles Wohlstetter (born 1910)] recruited the services of Jack Maguire and Phillip Lucier from a telephone supply company and then raised $1.5 million to form a holding company, Telephone Communications Corporation. Wohlstetter was named chairman of the new corporation, Lucier was named president, and Maguire was named vice-president. Some 30 years later, Wohlstetter's $1.5 million investment had grown into a company that had acquired and consolidated more than 750 smaller companies with total corporate assets hovering around $6 billion.

One of the company's first acquisitions was Central Western Company, which merged with Telephone Communications in 1961 to form the new parent Continental Telephone Company. The acquisition of Central Western, along with Harfil, Inc., provided the company with customer billing, general accounting, and toll separation services.

Continental based its early acquisition strategy on Kreigspiel, a historical war game German generals played at Prussian war colleges. [Charles Wohlstetter (born 1910)] applied the tenets of the game to telephone company operations and amassed detailed information on each independent telephone company in the United States. **When those companies came up for sale, Wohlstetter and Maguire, who were pilots, and Lucier, whose wife was a pilot, would promptly fly off to meet the owners and negotiate purchase agreements.**

Many of the early acquisitions were made through exchanges of stock, including the 1964 merger with Independent Telephone Company that doubled the company's size and changed its name in the process to Continental Independent Telephone Corporation. By the close of 1964, Continental had acquired more than 100 companies operating in 30 states.

The company adopted another new name, Continental Telephone Corporation, in 1965. Also during 1965 Continental acquired 65 more telephone companies and again doubled its size. By 1966 Continental had acquired more than 500 independent companies, had become the third-largest independent telephone company in the United States, and was one of the youngest companies ever listed on the New York Stock Exchange.

By 1970 Continental's assets had topped $1 billion, and sales volume had risen to $120 million. Lucier died that year and was succeeded as president by Maguire, who moved up from a vice-presidency. Aside from its dominating telephone business, the company's activities by that time had grown to include cable television systems, directory publishing, equipment leasing, and data services.

With the number of small independents having diminished considerably by 1970, Continental's pace in acquiring telephone operating companies was reduced. Continental sold its cable television business in 1971, and after a sluggish economy had taken its toll on Continental's manufacturing and supply subsidiaries, those, too, were sold in 1976. Maguire resigned in 1976 because of health problems and was succeeded as president by James V. Napier, a former executive vice-president. That same year, Continental became the first telephone company outside the Bell system to install a digital telephone switching system, a move that provided improved network operating efficiency, allowed the introduction of new calling features, and started the transition away from operations dominated by rural service areas.

In response to the changing regulatory climate of the telephone industry, in 1978 Continental mapped out a diversification strategy into nonregulated businesses. Continental's first diversification move came in 1979, with the acquisition of Executone, Inc., a New York-based communications equipment maker.

By 1980 Continental had two million telephone access lines in service and had established its first fiber-optic cable, a high-speed, high-capacity telecommunications transmission mode. While Continental continued the process of upgrading its telephone operations, during the early 1980s the

telecommunications transmission model. While Continental continued the process of upgrading its telephone operations, during the early 1980s the company's focus turned to greater diversification.

In July 1980 Continental entered the satellite business through a joint venture with Fairchild Industries, and a communications partnership firm, American Satellite Company, was formed to operate a network of earth-based stations that provided voice and data services. To provide technology services to accommodate its expanding needs, Continental then acquired two consulting and research firms, Network Analysis Corporation and International Computing Company.

In 1981 Continental acquired Page Communications Engineers Inc., later renamed Contel Page, which gave Continental expertise in the engineering, installation, and maintenance of satellite-to-earth stations. One year later, Continental hooked up with Fairchild Industries in a second joint venture called Space Communications Company, a provider of tracking and relay data services for such clients as the National Aeronautics and Space Administration.

After the Federal Communications Commission opened the door to licenses for 30 cellular phone markets in 1981, Continental plunged into that field as well, acquiring sizable shares of cellular markets in Los Angeles, California; Washington, D.C.; and Minneapolis, Minnesota. Continental also entered the credit card authorization business in 1981, with the purchase of National Bancard Corporation. Two years later, Continental bolstered its interest in that business segment with the purchase of the Chase Merchants Services division of Chase Manhattan Bank.

In 1982 the corporation changed its name to Continental Telecom Incorporated, adopted a new corporate logo, and inaugurated an advertising campaign around the theme "architects of telecommunications." Continental's expansion into the information services sector continued in 1982 with the purchase of STSC Inc., a computer services supplier; and Cado Systems Corporation, a maker of small business computers. That same year company revenues surpassed the $2 billion mark for the first time.

In 1984 Continental formed the subsidiary Contel Cellular Inc. to handle the corporation's growing cellular operations. A year later, Continental culminated its diversification moves and reorganized into four business sectors: telephone and cellular operations; business systems, offering voice and data processing products and services; federal systems, handling various facets of communication and information systems for government agencies; and information systems, offering telecommunications systems and services to large corporations, institutions, and government entities.

As a result of the company's growing interest in the information services marketplace, in 1985 Continental acquired several computer system and software companies, including Northern Data Systems, Data Equipment Systems Corporation, and Sooner Enterprises, Inc. Continental also purchased Fairchild Industries's interests in American Satellite Co., later renamed Contel ASC, and Space Communications Company.

That same year, Continental sold its directory publishing division, its time-share services business, and its credit card authorization business. In the midst of reorganization in 1985, Napier resigned, and John N. Lemasters, former American Satellite Company president, was named president and chief executive officer.

Continental's telephone operations were repositioned during the mid-1980s through numerous sales and exchanges. Subsidiaries in Nebraska, Colorado, Alaska, the Bahamas, and Barbados were sold, and operations in Michigan were exchanged for similar operations in Indiana and three southern states.

The name Contel Corporation was adopted in 1986. That same year, Contel's new tenant services division set the stage for future growth by acquiring tenant service operations in Atlanta and Seattle. The tenant services division installed and managed customized communications systems in commercial buildings and marketed those systems to the buildings' tenants. Contel also enhanced its information services division with the acquisition of IPC Communications, Inc., a supplier of a special-purpose telephone system used by financial traders, and expanded its federal systems operations with the purchase of Western Union Corporation's government systems division, a provider of information handling systems.

In September 1986 Contel announced it had agreed to merge with Communications Satellite Corporation (Comsat), but by mid-1987 Contel had called off the deal, citing Comsat's unstable financial picture. The failed merger sparked the resignation of Lemasters. Donald W. Weber, former executive vice-president and head of telephone operations, was named Lemasters's successor as president and chief executive officer.

Contel acquired Comsat's international private-line business and its very-small-aperture terminal (VSAT) satellite business in 1987, as well as Equatorial Communications Company, a provider of private satellite data networks. That same year, Contel agreed to sell Executone, its troubled telephone interconnect business, and Texocom, Contel's equipment supply business.

In the late 1980s Contel continued to narrow its focus in the information systems sectors. In 1988 it sold its computer-based business, Contel Business Systems, and a year later disposed of Contel Credit Corporation. Contel Federal Systems continued to grow during that same period, and in 1988 it acquired two Eaton Corporation subsidiaries: Information Management Systems and Data Systems Services. Two years later Contel purchased Telos Corporation, with expertise in government-preferred computer software. Contel's tenant services and cellular businesses also got a boost in 1988 with the acquisition of RealCom Communications Corporation, an IBM tenant services subsidiary, and Southland Mobilcom Inc.'s interests in the Mobile, Alabama, and the Pensacola, Florida, cellular markets.

In 1990 Contel completed the biggest acquisition in its history, a $1.3 billion purchase of McCaw Cellular Communications, Inc.'s controlling interests in 13 cellular markets, which added more than six million potential customers and doubled Contel's cellular potential population market (known in the industry as POPs). While important, that move was eclipsed by the merger with GTE announced later that same year. Through that transition, the two former competitors were expected to integrate telephone and mobile-cellular operations and capitalize on business unit similarities in the field of satellite-communications as well as in communications systems and services targeting government entities.

Over half of Contel's $6.6 billion purchase price, $3.9 billion, was assumed debt. When Charles Lee succeeded James (Rocky) L. Johnson to become CEO in 1992, his first order of business was reduction of that obligation. He sold GTE's North American Lighting business to a Siemens affiliate for over $1 billion, shaved off local exchange properties in Idaho, Tennessee, Utah, and West Virginia to generate another $1 billion, divested its interest in Sprint in 1992, **and sold its GTE Spacenet satellite operations to General Electric in 1994.**

The long-heralded telecommunications bill, expected to go into effect in 1996, promised to encourage competition among local phone providers, long distance services, and cable television companies. Many leading telecoms prepared for the new competitive realities by aligning themselves with entertainment and information providers. GTE, on the other hand, continued to focus on its core operations, seeking to make them as efficient as possible. In 1992, Lee launched a sweeping reorganization that was characterized by Telephony magazine as "easily one of the nation's largest re-engineering processes."

Among other goals, his plan sought to double revenues and slash costs by $1 billion per year by focusing on five key areas of operation: technological enhancement of wireline and wireless systems, expansion of data services, global expansion, and diversification into video services. GTE hoped to cross-sell

enhancement of wireline and wireless systems, expansion of data services, global expansion, and diversification into video services. GTE hoped to cross-sell its large base of wireline customers on wireless, data and video services, launching Tele-Go, a user-friendly service that combined cordless and cellular phone features. The company bought broadband spectrum cellular licenses in Atlanta, Seattle, Cincinnati and Denver, and formed a joint venture with SBC Communications to enhance its cellular capabilities in Texas. In 1995, the company undertook a 15-state test of video conferencing services, as well as a video dialtone (VDT) experiment that proposed to offer cable television programming to 900,000 homes by 1997. GTE also formed a video programming and interservices joint venture with Ameritech Corporation, BellSouth Corporation, SBC, and The Walt Disney Company in the fall of 1995. Foreign efforts included affiliations with phone companies in Argentina, Mexico, Germany, Japan, Canada, the Dominican Republic, Venezuela and China. The early 1990s reorganization included a 37.5 percent workforce reduction, from 177,500 in 1991 to 111,000 by 1994. Lee's five-fold strategy had begun to bear fruit by the mid-1990s. While the communication conglomerate's sales remained rather flat, at about $19.8 billion, from 1992 through 1994, its net income increased by 43.7 percent, from $1.74 billion to a record $2.5 billion, during the same period.

Principal Subsidiaries: Contel Corporation; GTE Products of Connecticut Corporation; GTE Leasing Corporation; Anglo-Canadian Telephone Company; GTE Holdings (Canada) Limited; GTE International Telecommunications Incorporated; GTE California Incorporated; GTE Florida Incorporated; GTE Midwest Incorporated; GTE North Incorporated; GTE Northwest Incorporated; GTE South Incorporated; GTE Southwest Incorporated; GTE Hawaiian Telephone Company Incorporated; GTE Data Services Incorporated; GTE Finance Corporation; GTE Information Services Incorporated; GTE Intelligent Network Services Incorporated; GTE Investment Management Corporation; GTE main Street Incorporated; GTE Mobile Communications Incorporated; GTE Mobilnet Incorporated; GTE Realty Corporation; GTE REinsurance Company Limited (Bermuda); GTE Service Corporation; GTE Telecom Marketing Corporation; GTE Vantage Incorporated.

Hearing on A. T. U. Reorganizing Set

Plan for Parent of Commonwealth Telephone Co. is Revealed

A federal court hearing will be held in New York city May 9 to consider confirmation of a reorganization plan for Associated Telephone Utilities, parent company of the Commonwealth Telephone Co., which operates 105 exchanges in Wisconsin.

Considerable A. T. U. stock is owned in Madison and Wisconsin.

Under the reorganization plan which is to be presented to the court, General Telephone Corp. a new firm, will acquire all assets of Associated Telephone Utilities except certain preferred stocks which secure the 6 per cent secured notes, and which, with a block of common stock of the new company, will be acquired by a new subsidiary, General Telephone Allied Corp.

Debenture holders and other general creditors of A. T. U. will get common stock of the new company, while holders of the 6 per cent secured notes will get $6 shares of preferred stock of General Telephone Allied Corp. Each $6 share will be convertible into 2.13 shares of common stock of General Telephone Corp.

The plan provides that the General Telephone Corp. shall have no funded debt, and will be restricted in creating such debts.

General Telephone Gains $3,675,000 Cash Under Plan

Special Dispatch to The Star.

NEW YORK, September 23.—General Telephone Corp. has been advised by Bankers' Trust Co., distributing agents for the company, that approximately 73,500, or about 75 per cent, of the 97,371 purchase rigths issued to purchase shares in the reorganized corporation, have been exercised.

As a result of the exercise of the purchase rights, there are now outstanding approximately 73,500 shares of $3 convertible preferred stock and 73,500 additional shares of common stock, and the new company has increased its cash position by approximately $3,675,000.

Under the plan of reorganization of Associated Telephone Utilities Co. consummated July 17, 1935, the preferred stockholders were given 60-day rights to purchase units consisting of one share of $3 convertible preferred stock and one share of common stock of General Telephone Corp. at the price of $50 per unit. The rights expired and became void at 3 p.m., September 20.

Mathews Gets Big Pay Offer

General Telephone Corporation Raises its Bid $10,000 a Year

Washington —(AP)— The General Telephone Service Corporation, of New York, was reported today to have raised by $10,000 a year its original salary offer to George C. Mathews to join the company as president.

Mathews, a member of the securities commission, recently admitted to newspapermen the possibility he might resign to enter private business.

Declined to Move

Friends of Mathews said today the company had declined to move its offices to Madison, Wis., one of the conditions Mathews was said to have stipulated in his negotiations, but had agreed to pay him $35,000 a year instead of $25,000. Mathews formerly lived in Madison, where he served as chief examiner for the public service commission.

The reports said, however, the company might transfer its headquarters to Chicago at a later date. The General Telephone Service Corporation succeeded the reorganized Associated Telephone Utilities.

1972 (Nov 28) - NYTimes - "Harold V. Bozell Dead at 86; Ex - Head of General Telephone"

PDF : [HN01F8][GDrive]

The New York Times

TUESDAY, NOVEMBER 28, 1972

Harold V. Bozell Dead at 86; Ex-Head of General Telephone

Special to The New York Times

LARCHMONT, N.Y., Nov. 27 — Harold V. Bozell, retired president of General Telephone Corporation, which became the General Telephone & Electronics Corporation, the second largest telephone company in the world, died today at New Rochelle Medical Center. His age was 86 and he lived at 37 Lincoln Street here.

Mr. Bozell was president of the telephone concern from 1940 to 1951. It changed its name in 1959, following its merger with Sylvania Electric Products, Inc. The company provides telephone service in 34 states, British Columbia, Quebec and the Dominican Republic.

He was born in Beloit, Kan., May 31, 1886, graduated from the University of Kansas in 1908 and earned a master's degree there in 1915.

Joined Yale Faculty in '16

Meanwhile, he served as a professor of electrical engineering at the University of Oklahoma and headed its electrical engineering department. He transferred to Yale University in 1916 and became assistant professor of electrical engineering.

While at Yale, he edited Electrical Railway Journal and in 1922 he was made the first editor of Bus Transportation. The following year he was named editor of Electrical World, a McGraw-Hill publication.

During World War I, Mr. Bozell headed various investigations for a special committee of the Naval Consulting Board and was a consulting engineer for the United States Bureau of Standards.

He joined the engineering firm of Bonbright & Co. in 1925. Then, in 1932, as part of a reorganization of management of Associated Telephone Utility Company, Mr. Bozell became vice president of that concern. In 1935 he was elected vice president of General Telephone Corporation, which grew out of Associated, and he became its president in 1940.

He retired as president in 1951 but continued for the next 10 years as a director and consultant.

Harold V. Bozell as he looked some years ago.

Mr. Bozell was vice president of the Independent Telephone Association from 1947 to 1949 and its president from 1949 to 1950.

In 1970 he was elected to the Independent Telephone Hall of Fame, which was organized in 1965 by the Independent Telephone Pioneers Association to recognize leaders of the independent (non-Bell) telephone industry who have made exceptional contributions to the industry's growth and development.

Mr. Bozell was a director of the Beekman-Downtown Hospital, the Larchmont Federal Savings and Loan Association, the Northeast Electronics Corporation and the Roanwell Corporation.

He leaves his wife, the former Isadel Read Heath, a daughter, Mrs. John B. Forrest, three grandchildren and three great-grandchildren.

A funeral service will be held at 8 P.M. Wednesday in the Larchmont Avenue Presbyterian Church. Interment will be private.

1985 (Sep 11) - NYTimes - UNIT OF GTE ADMITS PLOT TO GET DATA

Sept. 11, 1985 / **By Stephen Engelberg, Special To the New York Times / Source -** [HN01FA][GDrive]

The Justice Department today accused the GTE Government Systems Corporation of conspiring to illegally obtain internal Pentagon planning documents, and the company said it would plead guilty.

The company, a leading manufacturer of electronic warfare devices, also said in a statement that it would pay the Department of Defense $580,000 for the costs of the investigation. The Government brought the charge in Federal District Court in Alexandria, Va., The Justice Department said the company had also agreed to develop and enforce a company policy against misuse of classified documents. #3 Individuals Are Charged Officials said the company, of Waltham, Mass., agreed to those conditions to avoid the possibility that it could be barred from bidding on further military contracts. The Department of Defense said, "The company has terminated the improper conduct and fully understands that any recurrence will subject it to criminal prosecution and debarment."

In addition, a Federal grand jury in Alexandria today returned indictments against a GTE official, a former company official and the consultant charged with supplying the documents.

The indictment said the documents included the five-year military plan used by the Pentagon in preparing its annual budget request to Congress and "program objective memoranda," in which the military services lay out plans for specific weapon programs. The Justice Department said the company used the documents to make its own plans for marketing electronic warfare equipment to the services.

A Vice President Named

Those indicted were Robert R. Carter of Mountain View, Calif., a former GTE employee who the Justice Department said was marketing manager of the Electronic Warfare Organization of GTE's Western Division; Walter R. Edgington of Annandale, Va., a GTE vice president for marketing who worked in the company's Rosslyn, Va., office, and Bernie E. Zettl, of McClean, Va., a consultant who operated a Northern Virginia company called Zettl Associates.

The company faces a fine of up to $10,000. If convicted, Mr. Zettl could face a maximum sentence of up to 25 years in prison and a $30,000 fine; Mr. Edgington a sentence of 25 years in prison and a $30,000 fine, and Mr. Carter a sentence of five years and a $10,000 fine.

Harvey Greisman, a GTE spokesman, acknowledged that some of the documents involved were classified. But he said, "The use of such documents was a common industry practice and at GTE Government Systems, they were handled only by persons with appropriate security clearances."

Method of Removal Sought

Mr. Greisman said the company did not "condone such activities."

David Hopkins, the Assistant United Attorney who handled the case, declined to comment when asked whether other companies were under investigation for similar offenses. He said Federal investigators were trying to determine how the documents were removed from the Department of Defense.

The department said the company had agreed to a program to prevent a recurrance of such incidents. Company officers and manager will be required to certify that they have not improperly used or acquired Department of Defense internal documents, the department said.

Mr. Hopkins said the case began when a GTE official was preparing for a routine polygraph, or lie-detector, examination while applying for a higher security clearance. Before being attached to the machine, the employee was asked a series of questions. He admitted mishandling classified documents, according to Mr. Hopkins.

In the indictment, the Department of Justice charged that the documents were used by the company to identify and "make business preparations for potential contracts in the electronic warfare field and for preparing bids and proposals for contracts with the Department of Defense."

The indictment said that beginning at least as early as 1978, Mr. Zettl supplied the documents to GTE. They were mailed to a post office box in California, the indictment said, to avoid using the company's interdepartmental mailing system.

The indictment quotes a 1979 memorandum in GTE files that says of its consulting contract with Mr. Zettl, "We do not want to list on paper the work he is doing."

The contacts with Mr. Zettl continued at least through 1983, the indictment said.

Mr. Zettl was paid $23,967 in 1979, $18,283 in 1980, $29,236 in 1981, $24,022 in 1982 and $24,000 in 1983 by GTE, the indictment charged. In October 1983 the contract between Mr. Zettl and the company was extended for 13 more months at a rate of $2,000 a month.

1985 (Sep 12) - NYTimes - U.S. AIDE SAYS G.T.E. CASE IS PART OF CRACKDOWN

Sept. 12, 1985 / **By Stephen Engelberg, Special To the New York Times** / Source - [HN01FB][GDrive]

A senior Justice Department official said today that the prosecution of a major defense contractor on charges of illegally conspiring to obtain internal Pentagon documents is part of the Reagan Administration's broader, continuing effort to restrict unauthorized use of secret information.

Stephen S. Trott, head of the Department's Criminal Division, said the prosecution of the GTE Government Systems Corporation "represents a concern on the part of the Administration for protecting closely held information."

GTE, a major manufacturer of electronic warfare devices in Waltham, Mass., said Tuesday that it would plead guilty to a one-count criminal information filed in Federal District Court in Alexandria, Va., charging it with conspiring to illegally obtain Government documents. A grand jury also charged a consultant hired by the company and a current employee with both theft and espionage. And a former employee was charged with conspiracy.

But GTE argued that the practice of using internal budget documents was commonplace in the defense industry. Justice Department officials agreed that the practice was probably not limited to GTE, which is a unit of the GTE Corporation, based in Stamford, Conn. They said, however, that indictments of other contractors were not imminent and that the purpose of the continuing investigation was to discern who in the Pentagon had released the documents.

Morton H. Halperin, director of the Washington office of the American Civil Liberties Union, said the case marked the first time sections of the United States Criminal Code on either espionage or theft of Government property had been applied to misuse of classified information by a company's officials. In his view, the legal principles the Government seeks to establish could be used to muzzle public debate in newspapers and elsewhere.

Mr. Trott called Mr. Halperin's arguments "nonsense." "

He said the use of the espionage statute, which has been typically applied to cases in which there is intent to harm the United States, was decided upon in the GTE case only after a long internal debate.

Mr. Trott and others associated with the GTE case said the charges against two of the individuals were brought under both the espionage and theft-of-property sections of the Code because Judge Harrison Winter of the United States Court of Appeals for the Fourth Circuit previously had questioned whether a case involving stolen Government information could be brought under the theft statute.

Prosecutors said they wanted to assure a conviction would not be overturned on appeal.

"I'm really sad we had to do that," Mr. Trott said. "It over-describes the case. This isn't espionage." He added: "We debated this long and hard, and, because of that court decision, we really felt we had no option."

The espionage section of the Code cited in the two indictments had been applied previously to cases strictly involving spying activities against the United States. Earlier this year, however, the section also was invoked in the indictment of Samuel Loring Morrison, a Defense Department employee accused of taking classified photographs and providing them to a British defense publication.

"The GTE case, coupled with the Morrison case, constitutes an effort to establish an Official Secrets Act, which would make it a crime to publish or report any information which the Goverment says is classified," Mr. Halperin of the A.C.L.U. said. Army officials said today that the guilty plea by GTE would not have any effect on the company's effort to win part of a $4 billion Army contract to replace the service's vast networks of battlefield telephones.

Specifically, GTE was charged with conspiring to violate Title 18, Section 641, of the Criminal Code, a statute aimed at those who "embezzle, steal, purloin or knowingly convert to his own use or the use of another" any Government property.

Walter R. Edgington of Annandale, Va., a marketing vice president who worked in GTE's Rosslyn, Va., office, and Bernie Zettl, a former consultant to the company, were charged with violating that statute, as well as Section 793, which makes it a crime to misuse information related to the national defense.

Robert R. Carter of Mountain View, Calif., a former GTE employee who the Justice Department has said was marketing manager of the Electronic Warfare Organization of GTE's Western division, was indicted on a single conspiracy count under Section 373 of Title 18 of the Code.

1988 (June 26) - Los Angeles Times - 1984 Incident a Chilling Omen of Fraud Probe - By JOHN M. BRODER

Source - [HN01EG][GDrive]

WASHINGTON — In February, 1984, an agent of the Defense Criminal Investigative Service paid a call on [**Walter Roy Edgington (born 1925)**], a marketing executive at GTE Government Systems just down the road from the Pentagon. The agent said he was looking into the theft of secret military documents by defense contractors and free-lance consultants.

“You don’t have to explain. I know why you’re here,” Edgington reportedly responded, volunteering that he first saw classified Pentagon documents at GTE shortly after joining the firm in 1966 and had received a steady flow of secret data ever since.

“Every major corporation gets the same material,” the investigator said he was blandly told.

Massive Bribery Inquiry

The GTE case, it now appears, was a chilling portent of the massive Pentagon bribery investigation now unfolding across the country. As the GTE affair demonstrated, the $150-billion-a-year defense acquisition business is so vast, so complicated and so little understood that it offers opportunities for corruption and questionable business practices on a staggering scale.

To understand the dimensions of the Pentagon’s system for acquiring the weapons, trucks, ships, helmets, boots and the thousands of other things needed to project U.S. military power around the world, consider this: Not counting the legions of military and civilian personnel involved in secondary roles, the Defense Department has 50,000 designated contract officers, dealing with 300,000 military suppliers. It grants an average of 62,000 contracts every day.

By themselves, the rules spelling out the way defense contracts are to be sought and awarded are bound into books that occupy--literally--almost a quarter

of a mile of shelf space, Pentagon officials say.

And, for the business corporations large and small that seek government contracts, one of the critical elements at every stage of the long procurement process is information, especially advance information that competitors may not have.

What weapons and equipment are the armed forces thinking of obtaining--or cutting back on--in the future? How much money is being budgeted for current procurement of particular items and which programs are winning and which losing in the internal jockeying over funds and policy support?

Most important of all, once competition begins for a particular contract, what exactly does the Navy, or the Army or Air Force, want? What is the nature of the competition? Where is a rival's bid strong or weak? What clues can be gleaned about its product, its cost structure, manufacturing techniques and other proprietary matters? And what political forces are influencing--or might be brought to bear on--Pentagon decision-makers behind the scenes?

A Tight-Knit Fraternity

The quest for such information, as competitive in its own way as the struggle for contracts, has given rise to a tight-knit fraternity of consultants who know their way around the Pentagon jungle. Many labor diligently within the bounds of established procedures, but federal investigators say that some use payoffs, job promises or other gratuities to get such data improperly from contacts in the military bureaucracy.

The GTE episode offers an instructive primer or case study on how the defense acquisition business works in practice, how that practice sometimes diverges from theory and how easily it can all be corrupted.

It's a world of Beltway Bandits, Old Crows, rent-a-generals and let-the-buyer-beware--in this case, the buyer being the American taxpayer.

In September, 1985, the Department of Justice indicted GTE, [Walter Roy Edgington (born 1925)], a second GTE executive and [Bernie Edward Zettl (born 1922)], a colorful consultant who allegedly was funneling secret Pentagon papers to the company. GTE pleaded guilty to possession of classified material regarding electronic warfare programs and paid a $590,000 fine. Charges against the two GTE executives were dropped, but the Zettl case is unresolved.

Investigators involved in the case were furious that their superiors stopped the inquiry at GTE and did not allow them to pursue leads implicating at least 25 other major defense contractors and dozens of consultants. One investigator called the GTE case the "tip of the proverbial iceberg" and said the Defense Department and the Justice Department set the current probe back by two years by prematurely ending the earlier inquiry.

The Zettl case also opened a window on a little-known network of electronic warfare specialists known as the Assn. of Old Crows, a 25,000-member organization linking professionals in industry and the military. Zettl was one of the founders of the group, named for a World War II operation that jammed German radar signals.

Retired Military Officers

The Crows, scattered throughout the defense electronics industry worldwide, consist mainly of retired military officers who have moved into high-ranking positions in the major companies that supply sophisticated military jamming, surveillance and communications gear.

The association, based in Alexandria, Va., provides a remarkably efficient system for moving valuable information, officials familiar with the group said. Members, who maintain their contacts in the military and seek to provide their clients or companies with such things as early tip-offs on future Pentagon plans, meet formally and informally throughout the United States, Europe and Asia to swap war stories and industry gossip.

Gus Slayton, the group's executive director, asserted in an interview that the Old Crows are in no way linked to the present scandal. Only one of the 16 Pentagon officials and private consultants served with search warrants last week is a member, Slayton said, refusing to name him. Numerous executives of the defense firms searched belong to the group.

Secret Documents

According to charges filed in the GTE case, the company went to extraordinary lengths to conceal its possession of classified military documents and their sources. An official of a subsidiary of the firm rented a post office box in California to receive the secret documents obtained by Zettl to keep them out of the regular GTE internal mail system, the indictment said.

The government said GTE paid Zettl, a retired Air Force major, more than $120,000 in consulting fees from 1979 to 1983. A GTE internal memo said Zettl's connection to the company and his activities were to be kept confidential. "We do not want to list on paper the work that he is doing," the memo said.

To conceal the true nature of his work, prosecutors charged, Zettl submitted monthly reports "which made only veiled or no reference at all to the documents being provided."

Zettl Ruined Financially

According to an associate, the publicity surrounding the GTE case ruined Zettl professionally and financially. He is no longer in the defense consulting business, has moved from the Washington area and could not be reached for comment.

Among the documents GTE admitted illegally possessing were sensitive Defense Department budget reports, including program objective memoranda known in Pentagon jargon as POMs (to rhyme with "Moms") and 5-year defense plans, or FYDPs (pronounced "Fid-ips").

Access to such internal Pentagon planning documents can prove invaluable to a defense contractor, because they offer a preview of what weapons the military is planning to build, how many of them are likely to be bought and how much money the Pentagon plans to set aside for them.

A former mid-level military purchasing official said that "POM drills"--early reviews of spending priorities in which military officers hammer out internal agreements and compromises on future spending--begin about a year before the Pentagon budget is submitted to Congress. Program officers are literally locked in small rooms, sometimes for days at a time, until agreement is reached on what kind of new amphibious vehicle the Marine Corps needs, for example, or how many new aircraft the Navy wants to buy in the coming year.

All POM discussions and documents are supposed to be confidential, the former official said. But as soon as the meeting breaks up, contractor sales representatives and consultants begin calling the Pentagon, asking whether their favored system made it into the POM and trying to find out how much money was set aside.

It is a time for former military officers who have gone to work for contractors to hit up their buddies for favors, for current military officers to think about their post-retirement plans and for freewheeling consultants to try to make or buy friends who can open the Pentagon's vaults, the former official said.

"A retired lieutenant colonel, now working for one of the Beltway Bandits, calls a lieutenant colonel still in the service, a guy he's known for 20 years, and says: 'What's going on with this program?' It's a daily occurrence during POM drills," according to the former official, now an industry consultant himself.

Beltway Bandits are Washington-area firms that provide consulting services to government and industry, usually highly specialized. While some do detailed technical and analytical studies, others exist primarily as conduits to the government bureaucracy. They are scattered around the Capital Beltway, a freeway encircling Washington and running through newer Virginia and Maryland suburbs where many of these firms built their offices.

Intelligence Gathering

Within prescribed limits, such intelligence gathering is legitimate--even vital to the government and the defense industry. Companies need good information to make intelligent planning decisions and the Pentagon, for its part, needs strong suppliers well equipped to meet its special needs.

An official of one of the most prominent Beltway Bandits, a firm that does more than $300 million a year worth of studies for the U.S. government and private firms, said that in the last few years a new breed of bandit has sprung up, catering to defense contractors and sometimes operating at the edge of the law.

"I call them boutiques, four-man or five-man outfits, calling themselves 'marketing representatives.' I say they're sleazeballs," said the official, who asked that his name not be used. "These are usually very small offices. They don't do anything. They don't do studies. They don't sell anything, except information.

"They're connectors, fixers, who concentrate on the beginning of the process, who can go to their clients and say: 'The government is interested in buying such and such.' "

Among other things, such early notice helps a company decide whether or not to bid on a Pentagon job, in itself often a multimillion-dollar decision. Preparing a bid for a complex weapons system can cost as much as $5 million and involve a project team of as many as 100 company employees, one military procurement specialist said.

'Rent-a-General' Firms

A subgroup of these "boutique" consulting houses are the so-called "rent-a-general" firms composed solely of former generals and admirals. Industry will turn to one of these outfits for help on a specific project, knowing that the former officer can pinpoint a colleague still in uniform who is in a position to help the company.

In the current inquiry, for example, prosecutors allege that former Assistant Navy Secretary [Melvyn Robert Paisley (born 1924)] recommended last year that one of his clients, McDonnell Douglas Corp., retain retired Adm. James A. (Ace) Lyons, as a consultant on foreign aircraft sales. Lyons had just left his post as commander of the vast Pacific Command, which gave him access to top Korean military officers who were considering a major purchase of McDonnell Douglas F-18 jets.

Because military assignments rotate on a 2-year or 3-year cycle, a retired flag-rank officer has an incentive to cash in quickly on his connections because his friends will soon be moving on to new duties in the service, one retired officer said.

Once an item survives the Pentagon budget process, it then moves over to Congress, where it passes a number of pressure points that potential contractors or their agents can exploit. The budget first is reviewed by the Senate and House Armed Services committees and their influential staffs. Programs must survive scrutiny in these committees, and friends there can be critical.

Adding and Subtracting

Congress can add as well as subtract weapons from the Pentagon's recommendations. The Pentagon has tried several times to kill the Midgetman missile, for example, but the House keeps funding it. Individual lawmakers routinely lobby their colleagues to vote for weapons that would be built in their home districts, even those the military does not want.

Many defense sales representatives and independent consultants are former committee staff members who maintain close ties to the staffs and members of the committees. A plea to a congressman for information on a particular project, sweetened with speech fees, campaign contributions and promises of new manufacturing jobs in the district, often yields the desired effect, according to the defense aide of a Senate Armed Services Committee member.

Rep. Roy Dyson, for instance, who prosecutors say is under scrutiny in the current corruption investigation, accepted thousands of dollars in campaign contributions and honoraria for speeches from officials linked to Unisys Corp., a computer and defense electronics firm also under investigation. Dyson, a Maryland Democrat, sits on the House Armed Services Committee and its procurement subcommittee.

The appropriating committees of the House and Senate represent a final step before final votes on funding government projects and are the next access point for contractors. The name of the chairman of the defense panel of the House Appropriations Committee, Rep. Bill Chappell Jr. (D-Fla.), is said by federal law enforcement sources to have come up in the current fraud inquiry, although sources caution that the investigation is in its preliminary phase.

Chappell said last week that he sees as many as 100 defense industry representatives a day.

Basis for Company Bids

If a weapon survives Congress, it goes back to the Pentagon, where procurement officers prepare a Request for Proposals (RFP), a thick document containing the weapon's specifications and performance requirements that form the basis for company bids. Industry representatives lobby military officials at this stage to get more detailed information on the specs--and sometimes to get them tailored in ways that favor their firm.

Investigators are studying evidence that industry representatives have offered bribes for favorable treatment at this stage too.

The real effort, however, and the key to the current fraud and bribery case that prosecutors are building, comes near the end of the contracting process, the "best and final offer" stage.

After bids are received, Pentagon purchasing officials reject those firms that are not technically capable of carrying out a job and reduce the competition to

at most three or four companies. Those firms are asked to submit their final offers, which are evaluated solely on price.

“Now information on what the other guy’s price structure looks like, or what particular hardware piece he’s bidding, any information from his bid can be absolutely decisive,” said an industry consultant familiar with the process.

“The sleazeball gets this key data and might sell the information to one or more of the bidders. He can start a bidding war. Once you’ve lost two or three (competitions) because you played clean, you’re in trouble in your company. The incentive to participate and just not ask questions is very high.

“Once it starts, it spreads like a cancer; it contaminates everybody,” he said

Federal prosecutors are investigating whether top Navy officials sold “best and final offer” data relating to aircraft and jet engine sales to consultants, who passed the information to McDonnell Douglas and United Technologies Corp. These sensitive bidding documents are clearly marked “proprietary” and every industry executive knows he is not supposed to have such data from rival firms, an official familiar with the process said

Investigators are looking at 75 to 100 contracts, 15 major defense firms and about 50 consultants, according to U.S. Atty. Henry E. Hudson

The investigators who interviewed Edgington, the GTE executive, asked him why, knowing that he had unauthorized Pentagon documents and was continuing to receive them, he did not shut off the supply.

According to the agent’s memorandum, Edgington replied: “If you already have your feet in the mud, why take a shower?”

1990 (July 13)- NYTimes - "Contel Agrees to Takeover Offer by GTE"

By Barnaby J. Feder ; Source - [HN01D4][GDrive]

In a move that would sharply expand both its local telephone operations and its fast-growing cellular telephone business, the **GTE Corporation** said yesterday that it had reached a preliminary agreement with the [**Contel Corporation**] to acquire the Atlanta-based company in a stock swap. The deal would be worth about $6 billion, based on yesterday's closing stock prices.

If the deal is completed and approved by regulatory authorities, GTE, based in Stamford, Conn., would become the fifth-largest local telephone company in the nation, based on number of telephone lines - after the Bell Atlantic Corporation, the BellSouth Corporation, Ameritech and the Nynex Corporation - and its second-largest mobile phone operator, after McCaw Cellular Communications.

"Aside from the obvious synergy of our telephone and cellular operations, both companies have other areas of interest that are remarkably parallel," James L. Johnson, GTE's chairman and chief executive, said in a statement. He cited businesses that supply communications systems to governments, satellite communications operations and aggressive programs by both companies to gain a foothold in cable television services.

"It's a great strategic move and very gutsy," said Jack Grubman, who follows the telecommunications industry for Paine Webber. "The bigger you are in this industry, the better off you are. They got the best of the independent companies at a price that will look good in three or four years."

Investors took a shorter-term view, however. GTE's stock price fell $1.25 a share, to $29.75, in trading yesterday on the New York Stock Exchange. The more than 200 million shares GTE will issue to complete the transaction at an exchange rate of 1.27 GTE shares for each Contel share could dilute GTE's share earnings this year by about 10 percent, analysts said.

Contel shares rose $7.125 to finish at $35.125 a share on the New York Stock Exchange. Charles Wohlsetter, the entrepreneurial 80-year-old chairman of Contel, said that because of GTE's higher stock dividend, Contel shareholders will receive the equivalent of $1.85 a share in dividends for their stock after the deal, a sharp increase from Contel's $1.10-a-share payout.

The proposed deal is one of the largest to date in the telecommunications industry, which has been undergoing a period of consolidation. The MCI Communications Corporation recently bought Telecom USA Inc. for $1.25 billion. In April, GTE agreed to acquire the cellular phone operations of the Providence Journal Company for $710 million, and United Telecommunications Inc. said it would pay $500 million to complete its buyout of GTE's interest in the U S Sprint Communications Company. U S Sprint is the nation's third-largest long-distance enterprise, after the American Telephone and Telegraph Company and MCI.

Earlier this year, McCaw secured its place as the nation's largest cellular concern, based on number of potential customers in its service areas, by paying $3.4 billion for control of the Lin Broadcasting Corporation.

Mr. Wohlsetter and John L. Segall, Contel's vice chairman, will become vice chairmen of GTE and members of its board if the deal is completed. Mr. Wohlsetter would also become chairman of GTE's strategic issues, planning and technology committee. However, the actual roles of both men and of Donald M. Weber, Contel's president and chief executive, at GTE remain to be worked out, said Harvey W. Greisman, a GTE spokesman.

$3.1 Billion is Sales

Contel's attractions for GTE include 2.6 million telephone lines in 30 states, with a far-higher-than-average percentage of its exchanges employing modern digital switches. And Contel has completed a reorganization in which it shed a number of money-losing businesses accumulated during an ill-fated period of diversification. It netted $277 million on revenues of $3.1 billion last year.

Contel Cellular Inc., which is 90 percent owned by the Contel Corporation and 10 percent publicly owned, has franchises in 36 metropolitan areas. The franchises include valuable regions in the Southeast acquired last fall from McCaw for $1.3 billion, making Contel Cellular the seventh-largest cellular business in the nation.

GTE has undergone a wave of restructuring since Mr. Johnson became chief executive in 1988. In addition to phasing out GTE's ownership interest in U S Sprint, Mr. Johnson has shifted headquarters for the local telephone operations to Dallas, begun a drive to reduce employment by 14,000 and reduced GTE's involvement in the development and manufacturing of telephone switches by setting up a joint venture with A.T. &T.

GTE employs 158,000 people and has businesses in 46 states and 41 countries, including local phone companies in Canada and the Dominican Republic that serve 2.3 million customers. In addition to telecommunications, it has a large lighting business. It had net earnings of $1.4 billion on sales of $17.42 billion last year.

1991 (Dec 13) - NYTimes : "BUSINESS PEOPLE; President of GTE Is Named Chairman"

By Anthony Ramirez / Source = [HN01EH][GDrive]

The **GTE Corporation** yesterday named Charles R. Lee, its longtime president, as its new chairman and chief executive, effective May 1. Mr. Lee has also been a senior officer in the steel, real estate and motion picture businesses.

Mr. Lee, 51 years old, will replace James L. (Rocky) Johnson, GTE's chairman, who retires in May, when he turns 65, the company's mandatory retirement age. Mr. Johnson, who has served with GTE for 43 years, will remain on the board as chairman emeritus.

Based on 1990 revenue of $21.4 billion, GTE is the fourth-largest telecommunications company in the world after British Telecom, Nippon Telegraph and Telephone and the American Telephone and Telegraph Company. GTE earned $1.67 billion, or $1.93 a share, in 1990, up 4 percent from 1989.

Based in Stamford, Conn., GTE had 18.4 million telephone access lines worldwide in 1990, more than 86 percent of which are in the United States. It operates in 40 states, as well as Canada and the Dominican Republic. Earlier this year it announced a new venture in Venezuela.

Mr. Lee, under Mr. Johnson's leadership, was instrumental in GTE's $6.6 billion acquisition earlier this year of the Contel Corporation, a deal that expanded GTE's already large base of local telephone service, as well as service for cellular telephones. GTE is the second-largest carrier of cellular telephones behind McCaw Cellular.

In an interview, Mr. Lee said he planned "as seamless a transition as possible" between Mr. Johnson and himself. He noted that many of the policies of the last few years had been a result of teamwork by Mr. Lee, Mr. Johnson and other senior GTE officials and that he anticipated no major changes in corporate direction.

"We are well on our way to becoming one of the world's great telecommunications companies," Mr. Lee said.

Born in Pittsburgh, Mr. Lee seemed destined to become a steel executive, having come from "the steel capital of the world and proud of it," he said. After majoring in metallurgical engineering, or the shaping and application of metals, at Cornell University and getting his M.B.A. from Harvard University, Mr. Lee joined United States Steel as a manager of business research in 1964.

After six years in that job, he helped in the huge bankruptcy reorganization of the Penn Central Corporation as a vice president.

An executive search firm recruited him as senior vice president-finance, for Columbia Pictures, where he worked for nearly four years. In 1983, shortly after the Coca-Cola Company bought the movie studio, Mr. Lee went to GTE as chief financial officer, where he found a teammate in Mr. Johnson, the chairman.

"He's been the coach and I've been the quarterback," Mr. Lee said.

1997 (May 06) - Wired magazine - "GTE Takes Net Plunge with BBN Buyout"

See [HP004E][GDrive]

The nation's largest local phone company aims to expand its reach by purchasing one of the "backbone" Internet providers.

LEAPING HEADFIRST INTO the deep end of the Internet, **GTE said Tuesday that it will purchase Net pioneer BBN for US$616 million, and is partnering with Cisco Systems to develop new data services.**

The move helps position GTE, the nation's largest local phone company, as a full-service telecom outlet for corporate clients seeking Internet access and Web-site hosting, as part of its networking strategy. Such all-in-one packaging is seen as crucial to compete in today's increasingly complex and fast-changing telecom industry.

BBN spokesman Vaughn Harring said Tuesday that because his company's network helps account for nearly 80 percent of all traffic on the Internet, the increased capacity resulting from GTE's investment should result in faster service for the typical user. "The resources of a major telecom company were necessary to expand our service," he noted.

BBN has been around since the beginnings of the Net, when the system was still known as the Arpanet. It is considered one of the "backbone" Internet providers, along with MCI, Sprint, and WorldCom's UUNET Technologies.

Besides expanding its range of services offered, GTE is standing firm against AT&T as the leading long-distance carrier makes inroads to local phone customers. For the past two years, BBN has been the provider of networking systems for most of AT&T's Internet service. It is not yet known how the GTE buyout will affect AT&T's WorldNet operation.

AT&T holds a minority stake in BBN, and was believed to be interested in acquiring full control of the company. "Our relationship with AT&T is still being sorted out as a result of this news," Harring said.

GTE already claims some 100,000 subscribers to its Intelligent Network Services ISP. The alliance with Cisco aims to give more substance to this network, and to create new applications and services intended to meet the needs of major clients. GTE said its purchases of Cisco networking equipment for resale could reach more than $1 billion.

This has been an expensive week so far for GTE. On Monday, the company said it will buy a stake in Qwest Communications' coast-to-coast fiber-optic network for $485 million. Because of the acquisitions, GTE said it doesn't expect to meet projected 10 percent earnings increases for this year and next. Beyond 1999, though, the company is hoping that earnings will soar by as much as 15 percent a year.

"We think all this will mean a lot to Internet users across the country," said GTE spokesman Bob Brand. "Clearly we think this is a growth area for us."

GTE will soon commence a cash offer to acquire all outstanding shares in BBN for $29 a share. BBN reported an operating loss of $12.1 million for the quarter that ended on 31 March, compared with an operating loss of almost $30 million a year earlier.

GTE buys BBN for $616m

Deal for Internet pioneer puts firm ahead of AT&T, MCI

By Joann Muller
GLOBE STAFF

Stepping up an aggressive strategy to challenge nationwide telephone carriers, GTE Corp., the nation's largest local phone company, yesterday agreed to buy Internet pioneer BBN Corp. of Cambridge for $616 million in cash, or $29 per share.

The announcement came one day after GTE said it would pay $485 million for part of Qwest Communications Corp.'s nationwide fiber-optic network. The back-to-back moves enable GTE to offer a broad array of telecommunications services to consumers and businesses throughout the United States.

"Our goal is to be the first player to truly deliver local, long distance, Internet access and enhanced data services, all on a nationwide basis, all from one company, all on one bill, and all with a single point of contact for customer service," GTE chief executive Charles R. Lee told analysts.

The company, which is moving its headquarters from Stamford, Conn., to Dallas, also said it was teaming up with Cisco Systems Inc., a San Jose, Calif. networking company, to help manage its network and could buy more than $1 billion of Cisco products over five years.

Lee said the moves would pay off long-term for GTE shareholders, but cautioned that the heavy up-front investments would hurt short-term profits. He estimated that 1997 per-share earnings growth would be "flat to slightly positive," instead of the 10 percent earnings growth that had been expected before the moves were announced. The company said earnings could increase 13 percent to 15 percent a year starting in 1999.

GTE shares fell 1⅛, to 45, while BBN leaped 6¼, to 28⅞, on the New York Stock Exchange.

Under terms of the deal, which has been approved by directors of both companies, GTE will begin a cash tender offer for all

BBN, Page D2

GTE Corp.

Headquarters: Stamford, Conn.
Chairman/CEO: Charles R. Lee
Founded: 1918
Employees: 102,000
Stock: Down 1 1/8 to 45 on NYSE
Core business: Provides local telephone and mobile-cellular services to customers in 29 states, Canada, the Dominican Republic, and Venezuela. Also publishes telephone directories and supplies command, control, communications, and intelligence systems to US Department of Defense.

BBN Corp.

Headquarters: Cambridge
Chairman/CEO: George H. Conrades
Founded: 1948
Employees: 2,000
Stock: Up 6 1/4 to 28 7/8 on NYSE
Core business: Builds wide-area communications network systems. Also develops and markets packaged data analysis software products and performs contract research and development in computer, communications and acoustics.

From sound of things, BBN helped pioneer 'Net

By Hiawatha Bray
GLOBE STAFF

GTE Corp.'s $616 million investment in BBN Corp. will buy it a lot more than a major Internet service provider. In a sense, BBN is *the* Internet service provider, the company that constructed the ARPANET, the first primitive computer network that has grown into today's global web of data. Many companies, universities and government agencies collaborated to build the Internet, but no one participant is more closely identified with the project than BBN.

Yet when the company was founded as Bolt, Beranek and Newman in 1948, it wasn't involved with computers. Instead the company's specialty was acoustics – the study of sound. BBN designed the acoustics for the great hall where the United Nations General Assembly meets. And the company still does a great deal of sensitive work for the US Navy on ways to make surface ships and submarines quieter and harder to detect.

Given BBN's relationship to the Pentagon, it's easy to believe the popular story that the Internet was developed to ensure that military computer networks could survive a nuclear attack. But Frank Heart, who worked on the ARPANET for BBN, says the story is bogus.

Instead, the Internet grew out of an effort in the 1960s to allow computers at universities and research institutions to communicate with each other. BBN's involvement with the project began in the late 1950s, when the company hired a brilliant psychologist named J.C.R. Licklider.

"He was with the company only a matter of months, and he said, 'I want a computer,' " recalled Leo Beranek, cofounder of BBN.

"I asked what is it going to cost. He said $30,000. I said: 'My God, man, we've never bought anything more expensive than a water cooler. What are you going to do with it?' He said he didn't know but he knew that computers were the wave of the future."

Beranek got Licklider his computer, one of the first minicomputers from Digital Equipment Corp., and Licklider began hiring smart, ambitious students fresh from Harvard and MIT, and turned BBN into a center for computer research.

"BBN was thought of as sort of the third university. People would go from Harvard to MIT to BBN," said Katie Hafner, author of "Where Wizards Stay Up Late," a history of the Internet.

In 1962, Licklider left BBN to take a job at the Pentagon's Advanced Research Projects Agency. There he established the program that would eventually lead to the creation of ARPANET.

But it wasn't until 1969 that construction of ARPANET began. The goal was to connect computers at four major universities. BBN won the contract to attempt it – and they succeeded.

Even though the computers were connected, there wasn't a simple way to send messages. A BBN engineer named Ray Tomlinson solved the problem in 1972 by inventing electronic mail.

Now BBN is one of a handful of major firms that run the Internet's "backbone," the major communication lines that carry Internet traffic.

GTE buys Cambridge's BBN Corp. for $616m

■ BBN
Continued from Page D1

outstanding shares of BBN for $29 a share.

In acquiring BBN, GTE instantly acquires an Internet network that would have taken two years to build, said David Goodtree, an analyst with Forrester Research.

"That gives them a two-year jump" on competitors such as AT&T Corp. and MCI Corp., which are also scrambling to provide customers with Internet service.

And BBN, which created a forerunner of the Internet 28 years ago, is attractive to GTE because it has established customers and "a golden name," Goodtree said.

Building off of BBN's Internet base, GTE, with 1996 sales of $21 billion, expects to add $5 billion to $8 billion in revenues over the next few years, officials said.

GTE's purchase of BBN is a blow to AT&T, because BBN has been providing Internet access to AT&T's business customers since June 1995.

AT&T spokesman Mike Miller said the deal with BBN was a short-term solution and that AT&T has always intended to move its customers to its own Internet backbone, which is now in place.

The two companies are negotiating an end to the contract, but neither Miller nor BBN chief executive George Conrades would comment on the talks.

It had been widely rumored for more than a week that AT&T was about to buy BBN. Those rumors helped lift BBN stock from 15¾ on April 21, to 22⅝ on Monday, the day before the GTE deal was announced.

Yesterday's deal with GTE overshadowed the release of BBN's third-quarter results, which showed revenues of $95.9 million, about 58 percent higher than a year ago, and an operating loss of $12.1 million.

Much of the revenue growth was due to growth in BBN Planet, BBN's Internet services division, which had revenue of $48.2 million, up 134 percent from a year ago. Nearly half that revenue came from helping America Online Inc. expand its network to meet rising demand.

1997 (Sep 02) - GTE Press Release (archived with Verizon) - "GTE announces the launch of its new operating unit, GTE Internetworking; Internet pioneer BBN Corp. and GTE Intelligent Network Services combine to offer complete Internet Protocol networking services."

Source - [HC004N][GDrive]

IRVING, Texas -- **GTE Corp.** today announced the launch of GTE Internetworking, its new operating unit. **GTE Internetworking** includes the recently acquired [**BBN Technologies, Incorporated**], which 28 years ago developed the ARPANET, the forerunner to today's Internet, and GTE Intelligent Network Services, which provides Internet services to residential and small business customers. The new operating unit will offer Internet services to residential and small business customers and Fortune 500 companies.

The acquisition of [**BBN Technologies, Incorporated**], and launch of GTE Internetworking are key components of GTE's data strategy, one of a series of steps the company is taking to be a market-leading provider of voice, video and data services.

"GTE Internetworking is uniquely positioned to offer our customers the only complete, integrated Internet services using Internet Protocol (IP) networking technologies," said [**George Henry Conrades (born 1939)**], corporate executive vice president and president of GTE Internetworking. "We're building upon BBN's technological heritage and capabilities plus GTE's customer base, expanding national footprint and diversified distribution channels. Our mission is to help customers improve their business processes through the integration of IP technologies and telecommunications."

GTE Internetworking will work closely with other GTE units, including GTE Communications Corp., the company's new national sales, service and marketing unit, and GTE Network services, its regulated local exchange carrier.

GTE Internetworking will offer a full spectrum of internetworking services including dial-up and dedicated Internet access, high-performance Web hosting, managed security, network management, systems integration and Web-based application and integration services.

The new division will have responsibility for engineering and combining facilities such as data centers and network infrastructure as well as integrating new capacity on the company's high-speed, fiber-optic network being constructed by Qwest Communications Corp. Additionally, through BBN Technologies, its research and development arm, GTE Internetworking will continue to provide funded research and development services in the area of Internet Protocol networking, security, speech recognition and other advanced technologies.

With revenues of more than $21 billion in 1996, GTE is one of the largest publicly held telecommunications companies in the world. In the United States, GTE offers local and wireless service in 29 states and long-distance service in all 50 states. GTE was the first among its peers to offer "one-stop shopping" for local, long-distance and Internet access services. Outside the United States, where GTE has operated for more than 40 years, the company serves approximately 7 million customers. GTE is also a leader in government and defense communications systems and equipment, directories and telecommunications-based information services, and aircraft-passenger telecommunications.

1997 (Oct 16) - GTE in Fight for MCI; Offers $28 Billion

By JUBE SHIVER JR / Source - [HN01FC][GDrive]

WASHINGTON — Muscling into the biggest takeover battle in history, GTE Corp. offered $28 billion in cash Wednesday for ownership of long-distance giant MCI Communications Corp.

The combination of GTE and MCI would create a telecommunications behemoth with $40 billion in annual revenue and a network that would reach 24 million long-distance and 21 million local customers.

The deal would give GTE the broadest geographic base in the industry, positioning it at the forefront of the booming telecommunications industry, at the same time it has moved aggressively to grab a share of rapidly expanding Internet business.

GTE's bid comes two weeks after little known Jackson, Miss.-based WorldCom Inc. offered a $29.4-billion stock swap for MCI and an even earlier bid of $20.3 billion in stock and cash from London-based British Telecom.

After saying little about the bidding war around it in recent days, MCI issued a terse statement late Thursday that it would "review all issues and options" involving the competing offers. Some analysts, however, believe the firm may prefer the GTE cash offer, worth $40 per share, to WorldCom's stock.

GTE would have to borrow massively to afford the deal, though executives denied that the purchase would leave the firm overburdened with debt. As word of the deal leaked out Wednesday, GTE stock fell $2.18 to $48, while MCI shares rose $1.56 to $36.87.

If GTE, headquartered in Stamford, Conn., succeeds in acquiring MCI, the deal would rank as the largest cash deal in history, eclipsing RJR Nabisco Inc.'s $25-billion sale in 1989.

GTE Chairman Charles R. Lee confirmed that his firm was making the offer after stock markets closed Wednesday, saying in a letter to MCI Chairman Bert C. Roberts that it would "bring the benefits of competition to all markets and all customers, both nationally and globally."

Until recently, GTE, an old-line phone company founded 79 years ago in Wisconsin, had been widely regarded as a slow-moving and lackluster performer in an industry full of mavericks, such as WorldCom. A merger would force GTE to accommodate the flashier, more entrepreneurial style of MCI, whose in-your-face marketing campaigns have provoked scores of industry rivals.

"GTE is not the quickest company to the draw," said Mark Warner, a telecommunications venture capitalist who ran unsuccessfully for the U.S. Senate in 1996. "If there wasn't the WorldCom offer blazing the trail, I doubt if they would have made a bid for MCI. . . . They usually operate in a more cautious mode."

But Lee has been on a campaign to position GTE for a boom in use of the Internet and wireless telephones. During the last year, the company has added about 200,000 Internet subscribers through its $616-million acquisition of Cambridge, Mass.-based BBN Corp., whose computer network forms part of the Internet's electronic foundation. GTE has also signed up 1.5 million subscribers for its long-distance telephone service.

GTE, the nation's third-largest local telephone company, offers local phone service in California, Florida, Texas and 24 other states in the Midwest and West.

Unlike the regional Bell operating companies, GTE is in an enviable position of being exempt from regulatory restrictions requiring proof that its local markets are open to competition before entering the long-distance business.

But financial experts, noting that GTE had just $949 million in cash on hand as of June 30, question whether the company can deliver inexpensive, innovative phone service if it has to raise tens of billions of dollars to consummate its offer for MCI.

“The structure of the transaction is likely to debt-laden GTE, which will make it a little bit tougher to compete,” said Thomas H. Sullivan, a partner in the Washington telecommunications law firm of McDermott, Will & Emery.

GTE President Kent Foster rejected such claims, saying the combined GTE and MCI would have huge cash flow--more than enough to price telephone services competitively.

He said the deal would be accomplished “through bank financing and issuing public debt. This is simply another way to structure your debt equity. We will not have any problems generating income.”

GTE is not likely to face insurmountable antitrust objections from federal officials, according to experts. But the company has spearheaded challenges of telephone industry regulation in federal and state courts and could face a potentially hostile review by the Federal Communications Commission.

“From an antitrust point of view, GTE and MCI overall present a fairly favorable competitive picture,” said Leonard J. Kennedy, a veteran Washington communications lawyer, who represents several phone companies. “But they face potentially huge regulatory and political problems since they have been the principal litigant against the FCC and its policies.”

Foster does not believe GTE faces an uphill regulatory battle.

“But I think the regulators will analyze this deal and approve it on its merits because it creates a very powerful competitive situation,” Foster said.

MCI publicly has been supporting British Telecom’s $20.3-billion offer over WorldCom’s competing bid, despite the prospects that its shareholders may vote down the deal. MCI would face financial penalties if it fails to support the BT offer.

“The folks over at MCI have got to be smiling--folks are telling me they are impressed with the GTE offer,” said Jeffery Kagan, who heads his own Atlanta telecommunications consulting firm. “GTE is a very big, strong, profitable local telephone company that could use MCI’s marketing expertise to steamroll into the local telephone markets across the country.”

But consumer advocates cautioned that a GTE-MCI combination could reduce competition, since those companies are battling each other in the local and long-distance markets in California and elsewhere. That could delay the day when consumers see lower prices as competitors offer better deals in order to win customers.

“These companies have been going at each other’s throats trying to get into each other’s markets, and if they merge, that stops,” said Regina Costa, telecommunications research director for TURN, the Utility Reform Network in San Francisco.

The continued upheaval in the $600-billion telecommunications industry has compelled more communications companies to seek out partners that can help erect vast global networks with the capacity to cope with the burgeoning voice, video and data demands of the global Information Age.

Since Congress passed a sweeping reform law in 1996 aimed at spurring phone competition and lowering prices, the industry has been gripped by a wave of consolidation.

The megadeals include the $22-billion merger of Bell Atlantic Corp. and Nynex Corp. and the $15.7-billion combination of SBC Communications Inc. and Pacific Telesis Group. Even GTE was briefly targeted as a takeover candidate by long-distance giant AT&T; Corp.

As a result of GTE’s acquisition earlier this year of BBN Corp., a rival of WorldCom’s UUNet Technologies subsidiary, the combination of MCI and GTE would create a major force on the Internet, with control over a huge portion of the global computer network’s “backbone,” the electronic trunk lines linking Web users from coast to coast in the U.S.

GTE is the second-largest local phone service provider in California.

1997 (Nov 13) - GTE Press Release (archived with Verizon) - "GTE Corp. to acquire Genuity, Inc."

Source - [HC004M][GDrive]

IRVING, Texas - **GTE Internetworking**, a subsidiary of **GTE Corp.**, today announced that it will acquire [Genuity Incorporated], a **subsidiary of Bechtel Enterprises**. The terms of the transaction were not disclosed. The acquisition is subject to customary closing conditions, including the expiration of applicable waiting periods under the Hart-Scott-Rodino Act. **The acquisition will be completed through GTE Internetworking's affiliate, [BBN Technologies, Incorporated].** It is anticipated that the transaction will be completed by the end of the year.

GTE Internetworking, already a leading provider of Web hosting, is pursuing its strategy of enabling customers to transfer their business applications to the Internet. Moving mission-critical business processes to the Web allows customers to broaden market reach, lower the cost of sales, distribution, and support, and transform the relationships between companies and their customers.

GTE Internetworking has more than a thousand Web hosting customers, including some of the busiest sites on the Web--ZD.Net, Four11, LA Times, Boston Globe, Tribune Corporation, and NBC Interactive. The combination of GTE Internetworking with Genuity will provide an expanded global footprint with 12 fully networked data centers, creating an organization with an unprecedented ability to provide distributed Web hosting services.

Genuity is a value-added provider of distributed application hosting solutions. Genuity has strategically located data centers and a sophisticated load-balancing technology, Hopscotch, which together ensure efficient delivery of data across the Internet. **Genuity's unique Hopscotch technology helps solve busy server problems, network congestion, and Internet latency to deliver the highest levels of performance.** Its customers include cnet, CMP Publications, Inc., Excite, InterTel, and MCA/Universal.

"With this acquisition we continue to build the critical set of assets necessary to advance our position as a trusted provider of the enabling infrastructure for Internet commerce. We are combining our high-speed national backbone with global reach, robust public and private peering relationships, advanced hosting and distributed application management with our security and systems integration expertise to enable customers to migrate mission critical applications and business processes to the network," said [George Henry Conrades (born 1939)], president of GTE Internetworking.

"Genuity's network technology, and most importantly, its people, are what give us the competitive advantage," said T. Geir Ramleth, president and CEO of Genuity. "The integration of our robust hosting infrastructure and powerful Hopscotch technology with GTE Internetworking's extensive resources will create a synergistic union. And our similar cultures and vision for the future provide a unique opportunity for customers looking to transform their businesses using Internet technology."

"Genuity's robust distributed application hosting architecture will be instrumental to GTE Internetworking as we continue to focus on delivery of the most advanced distributed network-centric solutions," said Mark Shull, vice president and general manager of GTE Internetworking's Network Centric Solutions group. "This combination allows us to build on our existing base of technology and expertise to provide Internet infrastructure services for electronic commerce."

About Genuity

Genuity is a subsidiary of Bechtel Enterprises, the development, financing and ownership affiliate of the Bechtel organization. Genuity is a value-added provider of distributed application hosting, access and security technologies that provide cost-effective, scaleable and highly reliable Internet infrastructure for commercial applications. With headquarters in San Francisco, Genuity also has data centers established in Chicago, Los Angeles, New York, Phoenix, San Jose, Washington, D.C. and London. Genuity is the creator of Hopscotch, a service allowing organizations to ensure the accessibility and performance of their mission-critical Internet sites by eliminating DNS look-up failures and solving Internet latency problems. For more information, please call 1-888-Genuity, or visit the company's World Wide Web site located at Genuity

About Bechtel Enterprises

Bechtel Enterprises, Inc. is the development, financing and ownership affiliate of the Bechtel organization, a premier global engineer - constructor. It is a leader in the privatized infrastructure market, with ownership interests in 9 companies and 29 projects in the power, water, transportation, telecommunications, and technology sectors. Since 1990 alone, Bechtel Enterprises has participated in arranging nearly $12 billion in project financing. For more information about Bechtel please visit the company's World Wide Web site at Bechtel

About GTE Internetworking

GTE Internetworking, a unit of GTE Corporation (NYSE:GTE), includes the recently acquired BBN Corporation, which 28 years ago developed the ARPANET, the forerunner to today's Internet, and GTE Intelligent Network Services, which provides Internet services to consumers and small businesses.

GTE Internetworking offers customers, from consumers to Fortune 500 companies, a full spectrum of Internet services and solutions including dial-up and dedicated Internet access, end-to-end network management, high-performance distributed hosting and applications solutions, managed security, and systems integration, for customers migrating their mission-critical business applications to the Internet. GTE Internetworking draws upon BBN's expertise in funded research and development of advanced technologies, including satellites, digital radio, multi-gigabit routers, security, and speech, and GTE's strong existing telecommunications services, including local and long distance, wireless, paging, video, research, and Internet. The address for the GTE Internetworking's home page is www.bbn.com.

1998 (Feb 12)

MCI, WorldCom merger would become nation's largest

(Editor's Note: The following article concerning the proposed acquisition of MCI by WorldCom Inc., and its possible effect on the Internet, is condensed from two articles which were published in the January, 1998, edition of Boardwatch Magazine. Information from the articles by Editor/Publisher Jack Rickard and Copy Editor Bill McCarthy is reprinted with permission.)

The concept of an Internet monopoly was originally an oxymoron. There were a large number of networks, most notably universities and DOD contractors. If you interconnected them in cooperative fashion, for the exchange of data, you had an internet. And if it somehow connected to the NSFNet backbone after about 1986, it was on the capital "I" Internet.

Since the commercialization and privatization of the Internet - intended to end the government "monopoly" of the Internet - there has been approximately 1,400 Teramanhours spent by nearly everyone, but particularly telco types, in trying to devise a method to control or "own" the Internet. This can be terribly difficult with over 4,000 vendors in a competitive environment.

But the Internet is quite hierarchical. Almost all of the 4,470 ISPs we count in operation in the U.S. and Canada as of Dec. 1 get THEIR connection to the Internet from a relative handful of top-level backbone operators. And the distribution there is not very symmetrical either. These 4,470 ISPs, many of which sport more than one connection, have a total of 5,458 connections between them to backbones that we have some data on. MCI, Sprint and UUNET, together, provide 74 percent of those connections with about 30 backbones splitting up the rest.

And while the number of Internet service providers continues to grow, the number of national backbones they can connect to is beginning to shrink. GTE has purchased BBN and now Genuity. Even PSINet, which has struggled financially in the past two years despite continued growth, has now acquired Canadian backbone operator iSTAR.

But nothing in the history of business mergers in North America matches WorldCom's 12-year buying spree with its most significant deals, at least in terms of the Internet, coming in the past two years. In 1996, the company bought MFS Communications and UUNET Technologies, two of the biggest players in Internet traffic. In September, it bought CompuServe Network Services and ANS Communications, two of the largest and fastest backbones in the United States. And none of this includes what the company has been doing overseas, such as the recent purchase of the largest ISP in the Netherlands.

In a frenzied season of telcos shopping for each other, MCI Communications Corp. agreed Nov. 10 to be acquired by WorldCom Inc., after the telco that appears determined to buy the Internet sweetened its bid for MCI to $37 billion in stock and cash.

The new offer, raised to $51 a share from $41.50, will be paid in WorldCom stock to all shareholders other than British Telecommunications. BT, which holds a 20 percent stake in MCI, will receive $7.4 billion in cash. WorldCom, the number four long-distance phone company, also picks up $5 billion in MCI debt. With British Telecommunications cashing out, MCI shareholders will own about 45 percent of the new company, while WorldCom will have a 55 percent stake.

The actual number of shares of WorldCom common stock to be exchanged for each MCI share owned by investors other than BT will be determined by dividing $51 by the 20-day average of the high and low sales prices for WorldCom common stock prior to the closing, but will not be less than 1.2439 shares (if WorldCom's average stock price exceeds $41) or more than 1.7586 shares (if WorldCom's average stock price is less than $29).

Although the merger will take six to nine months to garner regulator approvals, Bernard J. Ebbers, president and chief executive officer of WorldCom, said there are "no issues that we can anticipate in even the worst circumstances that will derail this transaction."

The MCI WorldCom deal would surpass the largest U.S. merger so far, a $25.6 billion union of Bell Atlantic Corp. and Nynex Corp. that was completed in August.

Since its founding in 1968 and its revolutionary leadership in the breakup of Ma Bell, MCI has been reminiscent of the rebellious teenager who wakes up in his thirties to realize he has become his parent. Meanwhile, WorldCom seems to be busting out like a 16-year-old with the keys to the family car and high hopes of picking up some girls and beer.

MCI WorldCom will provide an interesting mesh of the executive staffs, starting at the top. During a news conference, Ebbers referred to Bert C. Roberts Jr., chairman of MCI, as "bossman," but few people in the business believe that Ebbers will actually take a back seat to Roberts. Upon completion of the merger, Roberts, currently chairman of MCI, will become chairman of MCI WorldCom. Ebbers will serve as president and chief executive officer of MCI WorldCom.

The merger agreement is subject to the approvals of MCI and WorldCom stockholders as well as approvals from the Federal Communications Commission, the Justice Department, which is preoccupied with desktop icons, and numerous state government bodies. In addition, the merger is subject to review by the European Commission.

What is next on WorldCom's shopping list? Ebbers said that executives will "focus our time" on the merger. But he added: "Entrepreneurs look for opportunities. If there are opportunities out there that make sense, we certainly will not shy away from them."

GTE seeks to block WorldCom-MCI merger

■ Company says deal would crimp competition

By JEANNINE AVERSA
The Associated Press

WASHINGTON — GTE Corp. is suing in an effort to stop the big WorldCom-MCI merger, contending it would crimp competition and possibly raise prices in the Internet and long-distance businesses.

GTE, which itself made an unsuccessful bid for MCI last November, says the merger would violate antitrust laws. MCI says GTE is just worried about competition.

The lawsuit, filed late Thursday in federal court, raises the same points GTE has made to the Justice Department and other regulatory bodies that are investigating the $37 billion deal.

GTE general counsel William Barr said Friday the lawsuit was "a firewall," filed in case regulators do not stop the merger.

"While we believe that the enforcement agencies are going to do the right thing ... at the end of the day GTE has to be in the position to defend its interests if our concerns are not fully addressed," he said.

Under the merger, MCI-WorldCom would control between 40 percent and 60 percent of Internet traffic flowing on "backbones" in the United States, Barr said. GTE accounts for between 8 percent and 10 percent of such Internet backbone traffic, Barr said.

Internet backbones are high capacity networks that carry Internet and other data traffic.

"The merger will give MCI-WorldCom a stranglehold over the burgeoning Internet and the incentive and ability to stifle competition from all other rival Internet backbone operators, including GTE," the company said in its suit.

WorldCom and MCI reject rivals' allegations that the merger would lead to higher pricing in the Internet and long-distance businesses, MCI spokesman Frank Walter said.

"We think GTE's motive is clearly to keep us from competing more aggressively in the local phone market where GTE has a virtual monopoly," said Walter. "It is disingenuous for them to take the mantle of pro-competition when they preside over one of the largest telephone monopolies in the country."

Walter also said there are 40 major companies, including AT&T, Sprint and IBM, that provide Internet backbone services.

GTE's lawsuit also alleges that the merger will "substantially lessen competition in the highly concentrated wholesale and retail markets for long-distance services."

MCI is the nation's second-largest long-distance company and WorldCom is the fourth largest. WorldCom accounts for 40 percent of long-distance service sold to other companies at wholesale rates, GTE's lawsuit says.

1998 (July 28) - CNN - "Bell Atlantic buying GTE : Companies to combine in $52.8 billion stock swap; deal likely to face gov't hurdles"

Source - [HM001D][GDrive]

NEW YORK (CNNfn) - Bell Atlantic Corp. said Tuesday it is buying GTE Corp. in an all-stock deal valued at $52.8 billion, bringing together Bell Atlantic's local and wireless phone service with GTE's local, long-distance, wireless and Internet businesses.

Both companies' boards have approved the acquisition, under which GTE shareholders will receive 1.22 Bell Atlantic shares for each GTE share. Bell Atlantic's Monday closing price of $45 puts the value of the deal at $52.8 billion.

Charles Lee, GTE's chief executive officer, said the transaction reflects GTE's "fierce determination to be a growth company," adding that the newly merged company will build upon GTE's and Bell Atlantic's "complementary strengths."

Investors, however, reacted coolly to the deal, sending GTE (GTE) shares down 3-7/8 to 51-7/8 in mid-afternoon trading. Bell Atlantic (BEL) shares fell 1-3/8 to 43-5/8.

"The deal makes sense from Bell Atlantic's perspective," said Anthony Ferrugia, an analyst at A.G. Edwards. "They're picking up data assets, they're picking up long-distance business - two very strategic assets."

Analysts were not so sure, however, that the deal was quite as positive for GTE because the acquisition values GTE at $55 a share, slightly less than its Monday closing price.

Eric Melloul, telecommunications analyst at Argus Research, told CNNfn the deal represents a bargain for Bell Atlantic, which could open the door for another bidder.

"There is no premium being offered for GTE," Melloul said. "I think someone may come in another month or two [with a higher bid]. I think GTE is worth about $60 to $65 a share."

Both Melloul and Ferrugia cited BellSouth as the leading candidate to step in and make a competing bid for GTE.

A GTE spokeswoman said the deal comes with a breakup fee of up to $2 billion if either company decides to pursue another merger opportunity, which could be another factor involved in Wall Street's negative reaction to the acquisition.

Lee, however, defended the purchase price as a "merger of equals in every way," adding that the newly combined company expects to increase its earnings per share in its first full year following completion of the merger.

"This transaction gets us both where we want to be, but it gets us there faster," Lee said.

Another merger, another FCC inquiry

The companies said they will offer bundled telecommunications services to customers, meaning local, long-distance, cellular and Internet services could be combined on one bill.

"Bundling of telecom services is one of the biggest trends today," said GTE's Lee. "We have an unmatched capability of providing those services to customers ... and we can do it at a better cost."

But the deal most likely will come under intense regulatory scrutiny. The Telecommunications Act of 1996 prohibits the Baby Bells from selling long-distance service until they can demonstrate that they have opened their local networks to potential competitors.

"I look forward to reviewing this merger when it comes before us," FCC Chairman William Kennard said in a statement. "I hope the parties will demonstrate how this merger advances the pro-competitive thrust of the Telecommunications Act."

Bell Atlantic has yet to pass this litmus test on its own, although GTE already offers long-distance service outside Bell Atlantic's region.

"Both companies are working on rolling out high-speed access to homes," said Ivan Seidenberg, Bell Atlantic CEO. "By combining our resources, we can drive prices down."

Nonetheless, Melloul said federal regulators likely will seek some kind of concession from the companies.

"If this deal is allowed, they will probably have to operate the long-distance company independently," he said.

Ferrugia, however, said this type of deal typically results in lower rates for consumers in the long run. He told CNNfn that while the telecommunications industry is narrowing to a few big players, the days of a single company controlling the industry are over. [154K WAV] or [154K AIFF]

1998 (Aug 08) - GTE wins Pentagon telecom overhaul pact

BRIAN FRIEL - Source - [HW005L][GDrive]

The Defense Department this week awarded telecommunications giant GTE a 10-year, $110 million contract to overhaul the Pentagon's above-ground telecommunications system.

GTE will be the lead contractor for the Above-Ground Telecommunications Backbone program at the Pentagon, part of DoD's 14-year renovation of the department's 55-year old headquarters. Construction crews are renovating the Pentagon structure in five sections. The first section is expected to be finished in two years. GTE and its 11 subcontractors will design, engineer, test, install and maintain the telecommunications backbone that will wire the Pentagon's five above-ground floors.

The backbone will carry telephone, computer, fax, video and data communications to 135,000 jacks throughout the building, replacing more than 100,000 miles of cables that run through the Pentagon. The backbone will handle both classified and unclassified communications for 24,000 Defense Department employees.

GTE will install the telecommunications system in two five-year phases. DoD expects the Pentagon renovation, which began in 1993, to be complete in 2007. Thousands of Pentagon employees are being relocated to temporary offices at other Northern Virginia sites during the reconstruction.

1998 Aug 09 ... some BBN and Genuity in there too

Host of companies compete for business data storage

Hosts rent space on servers to hold programs, data or Web pages

By Jerry Ackerman
Boston Globe

It was only a matter of time, once interstate highways were built, before roadside diners gave way to fast-food chains and mom-and-pop motels were replaced by Holiday Inns, Radissons, and EconoLodges.

And so it is today along the Internet information highway, where a battle is being waged for market share in a roadside service called hosting — storage of Web page text and other content for retrieval by computer users at the click of a mouse.

Along with storage, some hosting companies see the field evolving to include rental of specialized business software, on a per-use basis, to customers who need these sophisticated programs but can't afford their upkeep.

The players range from giants — such as IBM Corp. and GTE Corp., which got into the game last year by buying BBN Corp. of Cambridge, Mass. — to Sage Networks Inc., a Cambridge start-up intent on building a national hosting company by buying smaller operators, and tiny Taylor Group of Bedford, N.H., which is starting from scratch.

The prize is a position in an industry that now has 4,000 to 5,000 hosting companies, which maintain the computers, called servers, that store Internet data. While no hosting company is believed to hold more than 2 percent of the market, these companies had combined sales of $400 million in 1997, according to Forrester Research Inc. of Cambridge. That number is expected to reach $1.9 billion in 1999 and $10.5 billion by 2002.

Tied to online shopping

Underlying this rapid growth is the surging interest in online shopping.

Electronic commerce last year chalked up more than $20 billion in sales, two-thirds of that in business-to-business transactions. Forrester figures that by 2002, this number could reach $350 billion, as existing on-line companies — ranging from home-based enterprises to pioneering bookseller Amazon.com — are joined by retailers such as L.L. Bean, Macy's, and Sears, Roebuck & Co.

Many of the largest of these "e-commerce" companies manage their own servers and networks. But some big players, and most of the small ones, contract this work to hosting companies.

These often are Internet service providers, many of them local companies whose primary business is providing dial-up phone connections to the Internet.

But along with providing connections, they sell service packages that — for an average fee of $300 to $400 a year and frequently much higher for large users — store Web pages, execute orders, and provide software to post purchases to buyers' credit cards while transmitting deposits to sellers' bank accounts.

Still waiting to be tapped, however, are thousands of firms that could sell their products or services over the Internet but haven't tried, and others that have yet to exploit the World Wide Web's full potential.

Software products are coming out almost daily to ease the way, says Joseph Barlett, an analyst with Yankee Group in Boston. "Most companies going with a hosting provider today are not very sophisticated," he observes.

But many that are very savvy are still hiring hosting companies to help guarantee service quality for both external Internet pages and intranet content meant only for employees' eyes.

Forrester says there were 12,000 such "complex sites" last year, and predicts this number will grow to 20,000 by 2002. Many will be managed in-house, but many more firms will be paying thousands of dollars a year to hosting companies.

Looking further ahead, the Internet is on the brink of opening up new ways for companies to conduct their own internal financial and production affairs, using software that until now only large Fortune 500 companies could afford.

Testing the market

Seeing this opportunity, major business software developers such as Lotus Development Corp. (an IBM subsidiary), Microsoft Corp., and Great Plains Software Inc. are market-testing versions of their brand-name products for small companies — firms with 500 or fewer employees — to use via the Internet.

The concept calls for hosting companies to install master copies of such specialized software, and then rent access to users. International Data Corp. of Framingham, Mass. says 25 percent of 900 companies in a recent survey said they liked the idea for payroll processing; others saw a need for such services for economic forecasting or supply-chain management capabilities that they now lack.

"The capabilities in this field are just emerging," said Steven Brand, Lotus' manager for small business applications.

Hosting as a growth business is sharply defined in the "roll-up" strategy being pursued by Sage Networks, which since March has spent more than $20 million to buy eight hosting companies from coast to coast.

These acquisitions — in Atlanta, New York, Washington, D.C., Los Angeles and San Jose, Calif., — form the backbone of what Sage intends to be a national company that can establish brand identity in a now-fragmented market.

"We actually think that through consolidation you can build a large international company," said Bradley Feld, cochairman and one of Sage's founders.

Could become No. 2

By January, he said, Sage hopes to have between 15 and 25 acquisitions under its wing, with more planned for 1999. "We are now one of the top 10 hosting companies in the country and by the end of this year should be one of the top two."

Not that this represents a big market share.

Sage says it has tens of thousands of clients at its companies; some estimate that number is less than 40,000. The firm believed to be the nation's largest hosting operator, Hiway Technologies Inc. of Boca Raton, Fla., claims 87,000 customers.

And the runner-up, Verio Inc., which has 125,000 customers buying connections to the Internet, may be able to claim about 65,000 as hosting customers, based on rules of thumb that industry veterans say are commonly accepted.

Both Hiway and Verio also are pursuing roll-up strategies. Verio, based in Englewood, Colo., is publicly traded. Hiway has an initial public stock offering planned for this year.

Sage's buying spree has included a large, high-speed computer center near Washington, D.C., purchased from IBM Corp., to be the linchpin in the company's operations. A second center is being built in Atlanta, where two of its operating units are also based, at a projected cost of $1 million.

Sage's money comes mostly from a venture fund managed by a New York investment bank, Charterhouse Group International Inc. Patricia Riley, managing director, says Charterhouse has "well over $40 million in pure equity" committed to Sage.

"The way I look at this, you have a market that is growing exponentially and a business that creates profits quickly," she said. An IPO is planned, but no timetable has been set.

GTE, an international telecommunications giant with $23 billion in revenues in 1997, paid $616 million last year to buy BBN, which in 1969, as Bolt, Beranek & Newman, launched the forerunner of the Internet for the U.S. Defense Department.

Today, BBN operates under the name GTE Internetworking, still running key portions of the Internet and selling services to support its parent company's drive to compete against AT&T Corp. and MCI Communications Corp.

"We're shooting to be a leader in the hosting market," says John Vincenzo, a company spokesman.

Still under the BBN flag at the time, the company began commercializing hosting operations at its 11 U.S. locations in 1995, according to senior product manager Christine Silva.

Noticing smaller firms

Going first after large corporations that needed backup storage capacity, the company last year expanded sales efforts to include small and mid-size firms — companies with fewer than 500 employees or sales less than $100 million. Analysts say this sector is where electronic commerce is growing the fastest.

Vincenzo said GTE now has more than 1,000 hosting customers. It acquired one smaller hosting company, Genuity Inc., of San Francisco, late last year primarily because it had a data center that could be a GTE West Coast operations center. More acquisitions are possible.

Coming from a different direction, Dan Taylor, a Bedford, N.H., software consultant, sees new computer hardware technology paving the way for hosting centers to provide small businesses with payroll, engineering, manufacturing control, sales systems, and other software that they previously couldn't afford.

Taylor says the licensing fees for these high-end products, which big companies take for granted, weren't the problem.

It was the cost of hiring someone to install the software, manage its use, and install upgrades, in as many as 200 desktop computers in a medium-sized firm. These information systems managers, who can earn $80,000 to $90,000 a year, also must be available around the clock to solve problems.

The new hardware that is altering this picture is called "thin client" technology, a name that refers to the fact that those desktop terminals are stripped of their software storage capabilities — thinned down — to become terminals that connect to servers that function as a central computer.

May sound familiar

This may sound familiar to anyone who used a computer before the PC revolution , when computer terminals were wired to IBM, Digital Equipment, or similar mainframe computers that were tended behind closed doors by technicians. "The industry is calling it recentralization," says Taylor of this return to the past.

But by requiring that software be installed and maintained only at the servers, operating costs plummet and fancy software becomes more affordable.

Taylor this fall will launch his first application of this approach, installing accounting software in host servers at his company's offices that nearby New Hampshire College will be able to tap, via the Internet, for teaching its business courses.

Simultaneously, his company, The Taylor Group, is discussing the hosting of specialized business applications with New Hampshire's largest private manufacturing company, Cabletron Corp. of Rochester, and with a Massachusetts health care firm, Physicians Quality Care Inc. of Waltham, Mass.

Anticipating success in these pilot installations, Taylor recently bought a 9.5 acres of land in Bedford where he plans to build new offices for his 75-employee company — with 10,000 square feet of space set aside for a hosting center.

GTE Net division to hire 500 in state, change its name

By Ross Kerber
GLOBE STAFF

GTE Internetworking plans to hire 500 e-commerce consultants and engineers in Massachusetts this year to help develop its high-speed data network and offer services as part of a proposed spinout from GTE Corp.

The division, with headquarters in Burlington, also plans to announce today that it will change its name to Genuity Inc. as it becomes a publicly traded company.

The plan is part of a controversial bid by GTE and Bell Atlantic to gain government approvals for their $84 billion merger plan, which would create the country's biggest local phone company.

Currently, the GTE unit employs about 2,000 people in Massachusetts and 3,500 in all. It includes most of the assets of the former Bolt Beranek & Newman in Cambridge, which GTE bought in 1997 for $616 million. GTE says the unit had revenue of about $1 billion last year but wasn't profitable.

In 1969, Bolt Beranek was one of the Pentagon's first contractors for the computer system that became the Internet. More recently, the company has operated high-speed data connections for big corporations and Internet service providers. In February, it won a contract from America Online Inc., estimated to be worth more than $2.5 billion, to install new connections for the service provider.

If the Genuity spinout is approved, said GTE Internetworking's president, Paul R. Gudonis, the company would become one of the top four providers of Internet connectivity services, along with Sprint, WorldCom, and UUNet. To compete, Gudonis said, Genuity will offer more consulting services to help companies create corporate Internets and business-to-business services for e-commerce. Gudonis would be head of the new company.

The future of the division remains a touchy issue before regulators, however. In filings with the Federal Communications Commission, GTE and Bell Atlantic had proposed to spin off the unit as a public company and keep a 10 percent ownership interest, with an option to increase that to 80 percent within five years.

But competitor AT&T says that would leave those companies effectively in control of the unit. AT&T wants the FCC to insist that Bell Atlantic make more commitments to open local phone service to competition. The FCC is considering the arguments and hopes to rule on the merger by July.

Matthew Kovar, a manager at the Yankee Group consulting firm who follows the networking industry, said Genuity would be free as a stand-alone company to pursue a more aggressive strategy than it would be as a local phone company unit. "It's not a change to the entire business model," he said of Genuity's plans. "But maybe these are things they felt they weren't free to do, or weren't able to do, because of the lethargic Bell operating company mentality."

Gudonis said he couldn't discuss financial specifics, including the total amount of networking investment Genuity would make, until the company files registration statements with the Securities and Exchange Commission to sell public shares. No filings are expected until the FCC clears the merger of the parent companies, he said.

Gudonis's tenure with the GTE unit dates back to 1994, when he joined Bolt Beranak as president of what then was known as its "BBN Planet" division, providing high-speed data services to individual companies. The business totalled about $5 million that year, he said; now it will generate the majority of Genuity's revenue. In addition to Internet companies, customers include Honeywell and FleetBoston Financial Corp.

Genuity also will invest heavily to upgrade its Internet backbone services so it can eventually handle the heavy demands needed to send video signals to homes via cable modems and high-speed phone lines. Clients for these services include Yahoo Inc. and General Electric's NBC Interactive, he said.

The unit is also constructing a new office park in Woburn. Gudonis said it will house 1,400 people by next year, some of whom transferred from other offices in the state.

GTE, others play the name game

BY DENISE PAPPALARDO

LOS ANGELES — GTE Internetworking announced at Internet World 2000 last week it is changing its name to Genuity.

This development keeps the ISP in step with its parent company, GTE, which also announced that once its pending merger with Bell Atlantic is final, the joint company will be called Verizon.

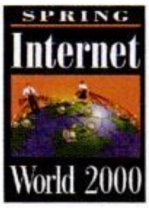
And to complete the name-game circle, Bell Atlantic Mobile and Vodafone AirTouch said last week they will call their joint wireless entity Verizon Wireless (see story, page 91).

GTE Internetworking, now Genuity, is changing its name as it prepares to become an independent company. In February, GTE and Bell Atlantic told the Federal Communications Commission they were willing to spin off GTE's ISP in order to see GTE and Bell Atlantic's merger through.

It is not known if the FCC will take them up on the offer, but the ISP is moving ahead with its plans. Paul Gudonis, president of Genuity, says the change is not dependent on the FCC's decision but is instead prompted by market shifts.

"The name change is part of an evolving strategy to take advantage of the next Internet revolution," Gudonis says. The company likes the fact that the name Genuity is a derivative of ingenuity, he says. He added some at the ISP wanted to go back to the ISP's roots and rename GTE Internetworking BBN Planet. Those folks lost out. GTE acquired BBN Planet in May 1997 and renamed the ISP GTE Internetworking four months later.

But the name Genuity is not new either. In November 1997, GTE Internetworking acquired the San Francisco Web-hosting company Genuity. By choosing a name the ISP already owned and hasn't used since the acquisition, they were able to avoid the exhaustive trademark and URL searches typically done when naming or renaming a company.



At the press conference, Gudonis also said Genuity signed a deal with Akamai to deploy Akamai's FreeFlow content-distribution servers throughout its network. Genuity will offer FreeFlow services in addition to its current content-distribution services, which are based on Inktomi servers and Genuity's Hopscotch load-balancing technology.

In other Internet World news:

- Akamai introduced its Traffic Analyzer and Reporter tools that offer FreeFlow content-distribution customers real-time and historical information on Web site performance.
- Sprint announced it is offering Microsoft Windows 2000 Advanced Server and Site-Server Commerce Edition Web hosting services to business customers. Win 2000 Advanced Server includes Microsoft SQL Server 7.0, which is used for advanced cataloging and database storage.

TECHNOLOGY & INNOVATION

Genuity's plan to raise $2.6b in IPO would be largest by ISP

BLOOMBERG NEWS

WASHINGTON – Genuity Inc., the pioneering Internet unit of GTE Corp., said its planned initial public offering could raise as much as $2.6 billion, making it the largest ever for a US Internet service provider.

GTE, a local phone service provider based in Irving, Texas, is selling 90.5 percent of Genuity, whose Internet roots date back to the sending of the first e-mail.

GTE is making the sale so regulators will allow it to be bought by Bell Atlantic Corp. and form the biggest US local phone company under the name Verizon Communications. Bell Atlantic said yesterday it expects to complete the purchase next month.

Burlington, Mass.-based Genuity first filed for the IPO last month without specifying the number of shares being sold or the price being sought.

"It's obviously a very large deal, and it's unclear in this type of environment how willing the market will be to swallow something of this size," said Darren Chervitz, a money manager at Jacob Asset Management in New York.

Genuity said it plans to sell 173.9 million Class A common shares for between $12 and $15 each, raising between $2.1 billion and $2.6 billion before expenses. At the $13.50 midpoint of the expected price range, the stock sale would be worth $2.3 billion, according to Genuity's amended IPO filing to the Securities and Exchange Commission.

At the top of the expected price range, Genuity would rank as the ninth-biggest IPO in US history and the largest ever for a US Internet service provider. Among worldwide Internet IPOs, Genuity would likely rank behind Germany's T-Online International AG, which raised $2.8 billion last month, Chervitz said.

The value of Internet stocks and IPOs have fallen in recent months. Since March 10, the Bloomberg US Internet index has dropped by more than half, from 301.78 to 137.64, while the Bloomberg IPO Index has sunk from 2415.11 to 1007.47.

Genuity said it plans to use $1.8 billion of the funds being raised to expand its network, which makes up part of the mesh of wires that connect computers around the world and are referred to as the backbone of the Internet. The rest of the IPO proceeds would be available for other general purposes, which could include acquisitions, although none are in the works now, the filing said.

The IPO funds would represent only a part of the company's capital spending plan to expand its network infrastructure at the cost of $11 billion to $13 billion between 1999 and 2004. Genuity plans to spend $1.8 billion to $2 billion on the project this year, according to the filing.

The entire company, with 192.2 million shares to be outstanding immediately after the IPO, would have a market value of between $2.3 billion and $2.9 billion at the IPO price range. At the midpoint, Genuity would be valued at $2.6 billion.

The combined GTE and Bell Atlantic hold about 18.3 million Class B common shares, giving them 9.5 percent in Genuity following the IPO. Those shares would be worth between $219.1 million and $273.8 million, at the $12-15 per share price range. At the $13.50 midpoint, the stake would be worth about $246.5 million.

Under their proposal to regulators, the companies could convert their Class B shares – which are largely identical to the publicly traded Class A – into 800 million Class C common shares, which get five votes each versus one apiece for the other classes. The conversion would give Bell Atlantic and GTE an 82 percent equity stake and 96 percent voting control over Genuity, the filing said.

The companies could make the swap if they permit competition from other companies within Bell Atlantic's local phone markets in 12 states, by an unspecified date in 2005. Bell Atlantic's 13th state, New York, already is open. US law forbids a local carrier from providing long-distance service – including Internet access – in states where it hasn't completed steps to allow local competition, according to the filing.

Bell Atlantic plans an IPO this year for another of its businesses, Verizon Wireless, which is a joint venture with Vodafone AirTouch PLC.

GTE shares rose 37.5 cents to close at $60.625, after reaching as high as $61.50 in late afternoon trading.

[HN01F6][GDrive]

2000 (June 19) - RCRWireless article - Verizon gets green light ; The FTC approves transfer of GTE Corp.'s communications licenses to Bell Atlantic Corp

See [HW005C][GDrive] - By Reily Gregson on JUNE 19, 2000Archived Articles

WASHINGTON-The Federal Communications Commission late Friday approved the transfer of **GTE Corp.'s** communications licenses to Bell Atlantic Corp. contingent on 25 conditions, including putting some wireless properties into a trust until they can be sold so as to not violate cellular cross-ownership rules.

"There will be those that will claim this merger brings us closer to a re-emergence of Ma Bell, however, my support is predicated on the applicants' enforceable commitments to open its traditional local markets to competitors, invest in new markets and accelerate deployment of broadband technologies. The end result should produce more competition, not less," said FCC Chairman William Kennard.

"This is a great day for Bell Atlantic and **GTE**, for our customers, our investors and our employees … This final approval contains reasonable conditions that clear the way to unite these two great companies into Verizon Communications," said Charles R. Lee, chairman and chief executive officer of GTE and designated chairman and co-CEO of the new company. The merger is expected to close by June 30.

Bringing GTE's wireless holdings into Verizon Wireless-the mobile-phone company consisting of Bell Atlantic Mobile, PrimeCo and Vodafone AirTouch plc-would create the nation's largest wireless company, with more than 24 million customers and a footprint covering 90 percent of the United States.

"Our ability to deliver a full plate of voice, data, Internet and wireless services to all our customers will make Verizon the next great brand in communications," said Ivan Seidenberg, chairman and CEO of Bell Atlantic and designated president and co-CEO of Verizon.

Bell Atlantic and GTE obtained Department of Justice approval after selling off overlapping wireless properties. [Note - US attorney general as of 2000 is Janet Reno, https://en.wikipedia.org/wiki/Janet_Reno]. Some of the sales were made in a multiproperty deal with Alltel Corp., which was approved by the FCC's Wireless Telecommunications Bureau last week.

One of the major conditions on the transfer involves GTE's Internet backbone, operation of which would violate the Telecommunications Act of 1996.

To get around the telecom act's prohibition against regional Bell operating companies offering long-distance services, Bell Atlantic and GTE proposed, and the FCC accepted, spinning off the Internet backbone into a new entity called **Genuity [(Genuity Incorporated (2000))]**.

Verizon would have a 9.5 percent interest in **Genuity [(Genuity Incorporated (2000))]** until Verizon is granted long-distance authority in the former Bell Atlantic states. Bell Atlantic has received such authority in New York but still has 12 states and the District of Columbia to go. Once approval has been obtained, Verizon would then be permitted to control up to 80 percent of Genuity. If approval is not granted for at least 50 percent of the old Bell Atlantic territory within five years, the conversion to 80-percent stock would evaporate.

Seidenberg said he expects long-distance approval within two years from the close of the merger.

This arrangement satisfied FCC Commissioner Susan Ness, who said approving the merger was "a close call."

Both Republican members of the commission partially dissented in the approval because of the conditions placed on it.

"None of the shortcomings I address here or in my previous statement on these issues will ever be addressed unless the commission begins to reform the majority's `balancing approach' to merger review that we apply again here, or seriously question the aforementioned specious theories of potential harm," said FCC Commissioner Michael Powell.

FCC Commissioner Harold Furchtgott-Roth also dissented because he does not believe the commission should be involved in regulating undersea cable licenses. This is one of the approvals the FCC granted.

Amid concerns that someone might challenge the license transfers, the companies said they believe the approval with conditions can withstand any court challenge.

"We think this arrangement is bullet proof. We believe we have the best lawyers and best consultants that one could have … We don't think there is a minuscule chance that this would be overturned," said Lee.

Fate of WorldCom/Sprint

Internet issues also may derail WorldCom Inc.'s hopes of marrying Sprint Corp. and gaining control of Sprint PCS.

Sprint Chairman William Esrey told shareholders last week at the company's annual meeting in Westwood, Kan., that some Justice Department staff do not support the merger.

"We have had a number of high-level meetings with [DOJ] officials in recent weeks, but it remains unclear if we will or will not get the necessary government clearances to implement the merger," Esrey said.

WorldCom needs the merger to fill in the large wireless gap in its offerings. Sprint needs to expand its international reach. Both companies would benefit from combining their fixed-wireless assets.

While DOJ seems concerned with the antitrust implications of a merger between the nation's No. 2 and No. 3 long-distance companies, the European Commission is concerned about WorldCom's dominance of the Internet. Experts believe WorldCom is willing to sell off Sprint's Internet backbone but not its stake in UUNet.

Similar concerns when WorldCom bought MCI Communications Corp. led to the sale of some of WorldCom's assets to Cable and Wireless plc. This sale was not successful and experts believe the EC does not want to create a repeat situation.

The EC is scheduled to make a decision by July 12

Should WorldCom/Sprint convince DOJ and EC officials that the merger would create an all-distance company in an all-distance telecommunications market, the company still must receive FCC approval to transfer its licenses.

Sylvania Electric Products was an American manufacturer of diverse electrical equipment, including at various times radio transceivers, vacuum tubes, semiconductors, and mainframe computers such as MOBIDIC. They were one of the companies involved in the development of the COBOL programming language.

History

[...]

The *Hygrade Sylvania Corporation* was formed when *NILCO*, *Sylvania* and *Hygrade Lamp Company* merged into one company in 1931.

In 1939, Hygrade Sylvania started preliminary research on fluorescent technology, and later that year, demonstrated the first linear, or tubular, fluorescent lamp. It was featured at the 1939 New York World's Fair.[1] Sylvania was also a manufacturer of both vacuum tubes and transistors. In 1942, the company changed its name to Sylvania Electric Products Inc.

During World War II, Sylvania was chosen from among several competing companies to manufacture the miniature vacuum tubes used in proximity fuze shells due to its quality standards and mass production capabilities.[2]

In 1959, Sylvania Electronics merged with General Telephone to form General Telephone and Electronics (GTE) [aka **GTE Corporation**].

Sylvania developed the earliest flash cubes for still cameras, later selling the technology to Eastman Kodak Company, and later a 10-flash unit called FlipFlash, as well as a line of household electric light bulbs, which continued during GTE's ownership and today is sold by Osram Sylvania.

In June 1964, Sylvania unveiled a color TV picture tube in which europium-bearing phosphor was used for a much brighter, truer red than was possible before.[3]

Through merger and acquisitions, the company became a significant, but never dominating supplier of electrical distribution equipment, including transformers and switchgear, residential and commercial load centers and breakers, pushbuttons, indicator lights, and other hard-wired devices. All were manufactured and distributed under the brand name GTE Sylvania, with the name Challenger used for its light commercial and residential product lines. GTE Sylvania contributed to the technological advancement of electrical distribution products in the late 1970s with several interesting product features. At the time, they were the leading supplier of vacuum cast coil transformers,

manufactured in their Hampton, Virginia plant. Their transformers featured aluminum primary winding and were cast using relatively inexpensive molds, allowing them to produce cast coil transformers in a variety of KVA capacities, primary and secondary voltages and physical coil sizes, including low profile coils for mining and other specialty applications. They also developed the first medium voltage 3 phase panel that could survive a dead short across two phases. Their patented design used bus bar encapsulated in a thin coating of epoxy and then bolted together across all three phases, using special non-conductive fittings.

By 1981 GTE had made the decision to exit the electrical distribution equipment market and began selling off its product lines and manufacturing facilities. The Challenger line, mostly manufactured at the time in Jackson, Mississippi, was sold to a former officer of GTE, who used the Challenger name as the name of his new company. Challenger flourished, and was eventually sold to Westinghouse, and later Eaton Corporation. By the mid-1980s, the GTE Sylvania electrical equipment product line and name was no more.

In 1993 GTE exited the lighting business to concentrate on its core telecomms operations. The European, Asian and Latin American operations are now under the ownership of Havells Sylvania. With the acquisition of the North American division by Osram GmbH in January 1993 Osram Sylvania Inc. was established.[4]

Brand name

In the early 1980s, GTE Sylvania sold the rights to the name Sylvania and Philco for use on consumer electronics equipment only, to the Netherlands' NV Philips. This marked the end of Sylvania's TV production in Batavia, New York, USA, and Smithfield, North Carolina, USA. The Sylvania Smithfield plant later became Channel Master. The rights to the Sylvania name in many countries are held by the U.S. subsidiary of the German company Osram. The Sylvania brand name is owned worldwide, apart from Australia, Canada, Mexico, Thailand, New Zealand, Puerto Rico and the USA, by Havells Sylvania, headquartered in London.

Osram Sylvania

Osram Sylvania manufactures and markets a wide range of lighting products for homes, business, and vehicles and holds a leading share of the North American lighting market [2]. In fiscal year 2008, the company achieved sales of about 1.75 billion euros, which comprised about 38% of Osram's total sales at the time. [5] Osram's worldwide lighting businesses employed about 9,000 people at the time. In 2016, Osram spun off the general lighting business which included the North American Osram Sylvania unit into an independent company called LEDVANCE headquartered in Garching, Germany. In 2017, LEDVANCE was merged into a consortium of Chinese investment companies and the Chinese lighting manufacturer MLS under the LEDVANCE name. The North American headquarters of LEDVANCE, previously referred to as Osram Sylvania, and located in Danvers, Massachusetts, was relocated to Wilmington, Massachusetts in 2015, a town north of Boston, MA. LEDVANCE continues to use the well known Osram and Sylvania brand names in their corresponding and representative markets throughout the world.

Advertising

Sylvania Skylark portable radio seen in a television commercial from the 1950s.

- From 1951 until 1956, Sylvania sponsored the game show *Beat the Clock*. The grand prizes on the show would be Sylvania television sets, and some consolation prizes would be Sylvania radios. Sylvania "Blue Dot (tm) for sure shot" flashbulbs would be used to take a photograph of the contestants in awkward outfits or messy stunts.
- One of Sylvania's heavily advertised TV features was a lighted perimeter mask of adjustable brightness called "HALOLIGHT", which was purported to ease the optical transition if a viewer glanced from a dark background to the bright TV screen. Today Philips markets an Ambilight feature, lighting the wall behind a flat display to soften the viewing experience. HALOLIGHT could not be adapted for color TV, because color TV white balance (aka tracking from low to high brightness) was unpredictable. Since the white color temperature of the HALOLIGHT and the illuminated color screen could not be made equivalent, HALOLIGHT was withdrawn.
- Osram Sylvania sponsored the It's a Small World ride at Disneyland in California with a twelve-year agreement starting in 2009[6]. In 2014, the sponsor logo at the attraction's entrance changed to that of Siemens, the parent company of Sylvania.

Accidents

The Sylvania Electric Products explosion, which involved scrap thorium, occurred on July 2, 1956, at their facility in Bayside, Queens, New York City.[7][8] The incident injured nine people;[7] one employee subsequently died of his injuries.[

The globalized world of the new millennium has become highly vulnerable to epidemics of infectious diseases. It is a vulnerability that has been underscored by several recent pandemics, including Covid-19. Driven by global demographic and societal trends, these events have become more frequent, larger, and - depending on the pathogen - more deadly.

Unfortunately, the 'out of sight, out of mind' mentality often results in lessons being forgotten during interepidemic periods. Epidemics will continue to wreak havoc on human and economic health unless we develop more effective and sustainable early warning surveillance, prevention and control programs. Join Duane J. Gubler, ScD, FAAAS, FIDSA, FASTMH, as he shares lessons learned and suggestions for mitigating the impact of future pandemics.

Gubler is Emeritus Professor and founding director, Signature Research Program in Emerging Infectious Diseases at the Duke-NUS Medical School, Singapore. He is Adjunct Professor in his alma mater, Johns Hopkins Bloomberg School of Public Health, the Duke University School of Medicine and Duke Global Health Institute. He has spent his entire career working on tropical infectious diseases with an emphasis on dengue, Aedes-transmitted and other vector-borne diseases. He worked for the Centers for Disease Control and Prevention for 25 years and has extensive field experience in Asia, the Pacific, tropical America and Africa, and has published extensively on all aspects of dengue and other vector-borne infectious diseases, with over 350 publications and 2 books to his credit. Gubler is a Fellow, Infectious Disease Society of America, Fellow, American Association for the Advancement of Science, and Fellow and Past President of the American Society of Tropical Medicine and Hygiene.

Dr. Duane Gubler is an Emeritus Professor and Founding Director of the Emerging Infectious Diseases (EID) Signature Research Programme at Duke-NUS Medical School, Singapore. As founding director, Prof Gubler led the establishment of the EID Programme in 2007 and to institutionalise and advance on the lessons learned from Singapore's experience with SARS in 2003 and H1N1 influenza in 2009.Thanks to this effort, Singapore's response to COVID-19 has been lauded by many around the world for the country's high level of readiness and efficiency.

Prof Gubler has spent his career working on insect-borne infectious diseases, in particular dengue and dengue hemorrhagic fever. He has lived in tropical countries for 26 years and has extensive field experience in Asia, the Pacific and Caribbean islands, Central and South America and Africa. Gubler has published more than 350 papers on every aspect of dengue and other vector-borne diseases and has served as a consultant to the World Health Organization and countless other agencies. He was instrumental in developing the Pediatric Dengue Vaccine Initiative.

A graduate of The Johns Hopkins University School of Hygiene and Public Health, Prof Gubler founded the Dengue Branch of the National Center for Infectious Diseases, at the US Centers for Disease Control and Prevention (CDC) and served as Chief for nine years, and as Director of the Division of Vector-Borne Infectious Diseases, CDC for 15 years, during which time he led the development of the US national Lyme disease program, the global response to the 1994 Indian plague epidemic, the1999-2004 western Hemisphere epidemic of West Nile encephalitis, and was directly involved in responding to the 1999 Malaysia Nipah encephalitis epidemic. He was previously Director of the Asia-Pacific Institute of Tropical Medicine and Infectious Diseases at the University of Hawaii. He has served on numerous WHO committees and study groups, and scientific advisory boards of a number of institutes and companies. He is a Fellow of the Infectious Disease Society of America, Fellow of the American Association for the Advancement of Science (AAAS), and is past President and Fellow of the American Society of Tropical Medicine and Hygiene.

Duane Gubler, ScD '69

DISTINGUISHED ALUMNUS AWARD

Emeritus Professor and Founding Director,

Emerging Infections Diseases (EID)

Signature Research Programme at Duke NUS Medical School, Singapore

Duane J. Gubler, ScD, is Emeritus Professor and founding Director of the Program in Emerging Infectious Diseases which is affiliated with the Duke University-Graduate Medical School in Singapore. He earned his ScD degree at the Johns Hopkins School of Public Health in 1969 under the guidance of acclaimed professor Lloyd E. Rozeboom. Gubler spent his entire research career investigating mosquito-transmitted diseases, especially dengue/dengue hemorrhagic fever. He has extensive research experience in Southeast Asia, the Pacific, tropical America, and elsewhere in the world with over 350 publications on both dengue and other vector-borne tropical diseases. Gubler served as Director of the Division of Vector-Borne Infectious Diseases, National Infectious Diseases Center for the CDC in Colorado for 15 years, and was founding Chief of the CDC's Dengue Branch for nine years. He has served as a consultant/advisor on numerous WHO committees. He is Past President and Fellow of the American Society of Tropical Medicine and Hygiene, Fellow of the American Association for the Advancement of Science and Fellow of the Infectious Diseases Society of America.

Warmer world could be a sicker place

The first evidence linking global warming to the spread of diseases is being evaluated.

By William K. Stevens
NEW YORK TIMES

Scientists have long theorized that climatic changes related to global warming could unleash outbreaks of diseases such as malaria, dengue fever, cholera and heat stroke. But with the modest amount of warming experienced so far, they have been unable to produce much hard evidence.

Now the experts have a research gift from an unlikely benefactor: El Niño. Combined with an underlying global warming trend, say scientists, El Niño will probably make 1998 the warmest year in several centuries.

And the heavy rains, droughts and other extreme weather fostered by El Niño over the last year are precisely what many scientists expect will also result from a predicted warming of the globe in the decades ahead.

So in the belief that 1997 and 1998 may provide a taste of what is to come, those who pay attention to the health effects of climate are now pulling together data about recent weather-related illness and death.

While most of the evidence they have found is circumstantial, it suggests that amid all the scientific smoke there is some fire.

These are some of the clues: The World Health Organization reports "quantitative leaps" in the incidence of malaria around the world; the incidence of cholera increased markedly over the last year in Latin America; warm, wet weather in the southern Rockies provided more food for deer mice, carriers of the hantavirus.

LIONEL CIRONNEAU / Associated Press

The beach is packed in Nice, France, on Monday. A heat wave gripping much of Europe caught people off guard in France, which has had a rainy summer with moderate temperatures.

While this and similar evidence is sifted and tested, scientists are also beginning to focus more closely on the health impact of extreme weather events quite apart from El Niño, especially in the United States.

One thing they are finding is that there is a statistically significant association in the United States between heavy rainstorms and outbreaks of waterborne diseases. These include hepatitis, E. coli infections and the cryptosporidium parasite that infected 400,000 people and killed 100 in Milwaukee in 1993.

If the relationship between heavy rain and disease is a solid one, the United States may be in for a surge of climatically induced waterborne illness. Analyses of the last century's weather records have found that extremely heavy rainstorms have become more common.

Climatologists say that this is what would be expected in a warming atmosphere, which holds more moisture and causes more water to evaporate from the oceans. The heavier rain that results is more likely to cause floods that not only kill people but also overwhelm drinking-water purification systems.

In the always contentious debate over climate change and the uncertainties that attend it, it has been especially difficult to get a handle on the question of health and disease. The Intergovernmental Panel on Climate Change, an international group of scientists advising the United Nations, recognized this in its 1995 report.

Some recent events, the intergovernmental panel said in 1995, might plausibly be early signals of climate-induced changes in human health. The panel cited a surge in heat-related deaths in India in 1995 (there was a similar surge this year), changes in the ranges of some insect-borne diseases and the spread of cholera along coastal areas in some developing countries.

But the group also said it was "not possible to attribute particular, isolated events to a change in climate or weather pattern."

The problem, said Dr. Duane Gubler, director of the division of vector-borne infectious diseases at the Centers for Disease Control and Prevention, "is that we may see some correlations" between climate and disease outbreaks, "but we don't know whether it's cause and effect." So, he said, "we're kind of cautious" in tying climatic change to changes in health.

Not a few experts point out, for instance, that while a warming atmosphere would theoretically be expected to expand the range of mosquito-borne tropical diseases such as malaria and dengue fever, reality is not so simple.

Temperature, humidity, rainfall and other weather factors are indeed some of the main things that influence transmission of the diseases. In some instances, temperature increases the virulence of the disease itself, by prompting viruses to multiply more. Heavier rainfall creates more standing water for some kinds of mosquitoes to breed in, and populations soar. Drought encourages people to store water in open containers, with the same result.

But in the developed countries, experts like Gubler say, public health pluses such as pest control and better living conditions (more tightly built houses, for example) have pretty much slammed the door on epidemics of mosquito-borne illness.

But the richer countries, including the United States, may not be immune to other climate-sensitive health problems, such as heat waves.

Many climate experts say that heat waves are likely to become more intense and more deadly. If they are right, what has happened in Texas this summer may be a foretaste. More than 100 people have died there in a heat wave that saw temperatures in Dallas rise above 100 degrees Fahrenheit for weeks on end.

1999 (May 04) - CJ Peters, Gubler assigned to what is called "Nipah" (Wasnt Peter Daszak working on this too ?)

Disease experts are stumped by killer virus from Malaysia

By Patricia J. Mays
ASSOCIATED PRESS

ATLANTA — In a quarantined laboratory, U.S. scientists outfitted in biohazard spacesuits are probing a killer that has struck on the other side of the world.

The mysterious microscopic enemy has killed more than 100 people in Malaysia in seven months, and scientists are baffled about its origin and mode of transmission.

"Every couple of years something like this comes along," says Dr. C.J. Peters, head of the special pathogens branch at the Centers for Disease Control and Prevention. "We don't know how this stuff spreads, how far it's going to go. We really don't know what's at the end of the tunnel."

The rare form of viral encephalitis, which spread from pigs to humans, first surfaced last year. It has since sickened more than 250 Malaysians, mostly pig farmers. Many of their herds fell ill, and some pigs died. A similar illness afflicted 11 slaughterhouse workers in Singapore, one fatally, who killed pigs imported from Malaysia.

Soldiers have killed almost 1 million pigs and some stray dogs to try to curb the virus. On Monday, pet owners in Malaysia's high-risk areas were told to get their animals checked immediately after new tests confirmed house pets could transmit the disease to humans.

Medical authorities named the new virus Nipah, for the village where it first was isolated.

As remote as the Nipah virus might seem, controlling and understanding it are a concern of epidemiologists around the globe because of fear it could spread quickly.

"In today's world, it's not unrealistic to think of the possibility that someone could get on a plane and land in San Francisco with it," says Dr. Duane Gubler, director of the CDC's Division of Vector-Borne Infectious Diseases at Fort Collins, Colo.

"In today's world, it's not unrealistic to think of the possibility that someone could get on a plane and land in San Francisco with it."

Dr. Duane Gubler
infectious disease specialist

For months, Malaysian health officials were certain the killer was Japanese encephalitis, a mosquito-borne virus common to the area. The two pathogens cause similar symptoms — high fever, aches, eventual coma and, often, death.

But most people in the region had been vaccinated for Japanese encephalitis as children. Also, it doesn't usually kill adult pigs.

The government declared a state of emergency in three Malaysian states and launched fogging and vaccination campaigns, to no avail. The Nipah virus raged on. And despite no proof that Nipah can infect people who eat or handle pork, the epidemic has wreaked havoc on Malaysia's nearly $400 million pork industry.

On March 7, baffled Malaysian researchers sought help from their counterparts at Gubler's CDC office in Fort Collins.

Six days later, a Malaysian researcher arrived in Fort Collins with slides of cells infected with the virus. The researchers worked through the weekend, screening the sample against dozens of known viruses. All were negative.

When they tried to isolate Nipah, it formed giant cells with multiple nuclei — epidemiological patterns not at all like Japanese encephalitis. By Sunday, a red flag had gone up: The Nipah virus fit in none of the three virus families studied at Fort Collins and was actually a previously unknown paramyxovirus. This family includes measles and mumps, but one of the last new paramyxoviruses discovered was the especially virulent Hendra virus.

"That was when we . . . sent it to Atlanta," Gubler said.

The samples were taken to a special CDC lab that houses deadly microbes that have no vaccine or cure, such as the Ebola virus that killed 245 Zaireans in 1995.

The CDC's medical detectives quickly identified the culprit as related to but far deadlier than the very rare Hendra virus. Hendra was first detected in 1994 in Australia, where it killed 15 racehorses and two trainers.

But they know little else.

The Asian tiger mosquito— which has white stripes on its legs and thorax — is believed to have arrived in Houston around 1985 via a shipment of tires from Japan. The species quickly spread, transported mostly in scrap tires.

Asian tiger mosquito thrives despite devastating drought

Associated Press

UPPER MARLBORO, Md. — The lack of rain might have curbed the population of garden-variety mosquitoes this summer, but experts say a particularly stringent variety — the Asian tiger mosquito — is spreading.

It defies most mosquito stereotypes. It will breed in anything that holds water, even tiny amounts, such as flowerpots, tires, old soda cans and clogged rain gutters. It bites more often than standard mosquitoes.

It is especially prevalent in inner-Beltway communities in Prince Georges County. But researchers say they are sure Asian tigers are all over the metropolitan area.

"They're spreading and worsening," said Jeannine M. Dorothy, an entomologist in the Maryland Department of Agriculture's Mosquito Control division. "There's really no way we can control it."

The Asian tiger — which has white stripes on its legs and thorax — is believed to have arrived in Houston around 1985 via a shipment of tires from Japan. They quickly swept up the coast of the southeastern United States, transported mostly in scrap tires.

Asian tiger mosquitoes were found around a tire recycling plant in Baltimore in the late 1980s and showed up around the same time in Prince Georges.

Scientists say the Asian Tiger is hard to slap dead.

"There are some mosquitoes that will just sit on you, but the Asian tiger is hard to kill because it's very flighty," said Stephen Sackett, field operation supervisor for the New Orleans Mosquito Control Board. "The Asian tiger will come in quick, bite and fly off."

Scientists say that in laboratory settings, the Asian tiger has been found to be a successful disease bearer, or "vector," able to transmit maladies such as encephalitis, Dengue fever, yellow fever, and dog heartworm. Outside the laboratory, there have been no reported fatalities connected to the Asian tiger.

"We keep watching it. We monitor it," said Duane J. Gubler, director of vector-borne infectious diseases at the Centers for Disease Control in Fort Collins, Colo. "So far, there is no evidence that it is involved in human disease transmission."

Insect repellent body creams and sprays do work, Dorothy said.

Their numbers can be cut down by getting rid of standing water, no matter how little. Other tips include changing birdbath and wading pool water once a week and keeping ornamental pools stocked with minnows.

Dorothy is investigating the unproven idea that copper might kill Asian tiger larvae. She said cemetery workers in Louisiana noticed that bronze flower vases don't incubate mosquito eggs the way ceramic and cement vases do.

To test it, Dorothy has set up little experiments in Cheverly, Bladensburg and other small Prince Georges towns. Her control tires have stagnant water in them; others hold copper tubing, old pennies and water.

"I hope it works," she said. "If it does, we will be able to say, 'You can control Asian tigers and it only costs pennies a year.' "

ALL OUT ATTACK

Virus surprised pros

Rarity of disease caught city health officials off guard

By MICHAEL R. BLOOD
DAILY NEWS CITY HALL BUREAU CHIEF

On Aug. 23, the city Health Department was alerted by a Queens hospital that several elderly patients had an unknown illness that attacked with alarming ferocity — high fever, nausea, paralysis.

It wasn't until last Friday — nearly two weeks later — that the city announced it was facing its first outbreak of potentially deadly St. Louis encephalitis.

By then, two patients had died and scores of others were potentially infected by the mosquitoes that carry the virus.

"I think it's one of these deals when officials looked at it and just didn't believe it," said Jonathan Day, a University of Florida professor who has studied the disease since 1983. "I think that if there had been a history of the epidemic in New York City — such as Chicago, Houston or Dallas — I think it would have been recognized much more quickly."

What city officials knew and when they knew it is being asked as helicopters blanket neighborhoods with insecticide and frightened residents stay indoors or coat themselves with bug repellent to ward off mosquito bites.

Could New Yorkers have known sooner that danger was buzzing at their ears?

"St. Louis encephalitis is a virus that is normally in the southern part of the United States," said Bill Reisen, an expert on mosquito-borne viruses at the University of California at Davis.

For doctors in New York City, "It certainly isn't something you would look for," he said.

It was one month ago — Aug. 10 — when a 60-year-old Whitestone, Queens, man walked into his doctor's office complaining of high fever, weakness and nausea. He would become the earliest known case of symptoms that would be identified as St. Louis encephalitis, which is now blamed for three deaths in the city.

Doctors at Flushing Hospital Medical Center, where the man was admitted Aug. 12, thought they had a case of pneumonia on their hands. But the man's condition worsened, and it wasn't until several other patients with similar symptoms were admitted that doctors began to suspect something more serious and widespread.

"We weren't quite sure what it was," said Rick Conetta, director of critical care and medicine at the hospital.

Hospital officials alerted city health officials of the mysterious cases Aug. 23 — but it wasn't until Aug. 29 that the federal Centers for Disease Control and Prevention was notified, said CDC spokesman Tom Skinner. The state was not notified until Sept. 2.

The city shipped the CDC blood and spinal fluid samples Sept. 2, and the first cases were confirmed last Friday.

It's at that point, after two elderly patients had died of the virus, that the public was made aware of the outbreak — on the Friday afternoon before Labor Day.

"It was unclear what was going on with the initial patients," said Marcelle Layton, who heads the city Health Department's Bureau of Communicable Diseases.

Before the CDC confirmed the cases, "it was unclear whether this was due to a mosquito-borne virus. It never happened here before," she said.

"No one was sitting on these samples, as far as we know," said Duane Gubler, the CDC's director of the Division of Vector-borne Diseases.

Mosquitoes become carriers of the virus after feeding on infected birds. Most people bitten by infected mosquitoes will never realize it or will develop only mild symptoms. But the virus can be deadly for a small percentage of the population, particularly the elderly.

Scientists are still puzzling over how the outbreak came to Queens. No other outbreaks have been reported nearby, they said.

"I don't think that they have as much control over the situation as they'd like us to believe," Bayside resident Mitchell Mayer said of health authorities. "I'm a little frustrated and a little scared."

"I don't think that they have as much control over the situation as they'd like us to believe."

THOMAS MONASTER DAILY NEWS

ON THE ATTACK Fire officials load cans of insect spray into a van yesterday at Queens post.

Steps in the virus scare

Aug. 10: A 60-year-old Whitestone, Queens, man goes to his doctor complaining of fever, nausea and weakness. He is admitted two days later to Flushing Hospital Medical Center, exhibiting the first known symptoms of what will be identified as St. Louis encephalitis.

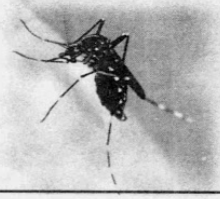
Aug. 15: An 80-year-old man is admitted to the hospital's intensive-care unit suffering from a heart attack and a fever of 104 degrees.

Aug. 18: A 75-year-old man is admitted to the intensive-care unit with a high fever and deteriorated mental state.

Aug. 23: Doctors alert Dr. Marcelle Layton at the city Health Department. She tells them to send blood and spinal fluid samples to the Centers for Disease Control and Prevention's lab.

Aug. 27: Health Department reviews medical charts.

Aug. 29: Department calls CDC to report cases of unexplained encephalitis-like illness.



Aug. 31: CDC dispatches its first team of investigators to New York.

Sept. 2: CDC receives blood and spinal fluid samples from four patients suffering from similar symptoms of nausea, fever and paralysis.

Sept. 3: CDC confirms three cases of St. Louis encephalitis, and announces one death, the 80-year-old man. City begins spraying insecticide.

Sept. 4: Two more cases are confirmed, as well as the death of an 87-year-old woman.

Sept. 8: CDC confirms first case with no known Queens connection — in Sunset Park, Brooklyn — bringing the number of confirmed cases to nine, with three deaths.

Yesterday: City begins spraying citywide.

1999 (Sep 25) - NYTimes : "African Virus May Be Culprit In Mosquito-Borne Illnesses"

Duane Gubler tests and FINDs "west nile" in those birds....

By Jennifer Steinhauer / Sept. 25, 1999 / [HN01I8][GDrive]

African virus may be cause of N.Y.C. 'encephalitis' cases

The New York Times

NEW YORK — The mosquito-borne illness that has killed three people in New York City may not have been St. Louis encephalitis, as experts thought, but may have been a similar disease that has never been diagnosed in the Western Hemisphere, government scientists said Friday.

The disease, West Nile virus, was discovered this week in dozens of birds that died in and around the Bronx Zoo this summer. The virus is indigenous to north and east Africa and Asia, and occasionally makes its way to Europe, but it has never been found in birds or humans in the Americas, said Duane Gubler, the director of the division of vector-borne infectious disease for the federal Centers for Disease Control and Prevention.

Before Friday, the illness that has infected at least 14 people in New York City and four in Westchester County was believed to be St. Louis encephalitis, which was surprising enough, because that disease is rarely found outside the southeastern United States.

Scores of tests will be needed before health officials are sure whether the people stricken were infected by some type of West Nile virus-like illness or St. Louis encephalitis. Officials at the CDC said they hope to complete the tests next week.

But the discovery of the West Nile strain in the birds has cast doubt on the original diagnosis, officials said. "West Nile virus is closely related to St. Louis encephalitis, the virus we thought was causing the outbreak," Gubler said. The discovery of the dead birds, he added, "has caused some confusion as to whether that is true now."

If officials confirm that the disease that sickened New Yorkers was the West Nile virus, it would have no practical effect on those who have become ill, or on the efforts to prevent the disease from spreading. Both illnesses are transmitted from birds to mosquitoes to people, via the same type of mosquito. The insecticide used to kill those mosquitoes is exactly the same.

The symptoms of both illnesses are virtually the same and are usually mild, though in rare cases they can cause neurological disorders and even death. Experts said those severe cases — which generally involve the elderly, children under 5 and those with compromised immune systems — are even less frequent with West Nile virus. With both illnesses, there is no cure.

"The important message to get across is that all the public health and responsive measures implemented are the same," said Tom Skinner, a spokesman at the CDC.

But from an epidemiological standpoint, the discovery of West Nile virus in New York is stunning. "This is exciting," Gubler said. "We prefer it didn't occur, but it is interesting.

"What we are seeing in the waning years of the late 20th century is the transport and movement of these viruses in new areas," he added. "And you get a virus moving into a new area, the entire mosquito population is susceptible."

The mosquito-borne illness that has killed three people in New York City may not be St. Louis encephalitis, as experts have thought, but rather a similar disease that has never been diagnosed in the Western Hemisphere, Government scientists said yesterday.

The disease, West Nile virus, was discovered this week in dozens of birds that died in and around the Bronx Zoo this summer. The virus is indigenous to Asia and northern and eastern Africa and occasionally makes its way to Europe, but has never been found in birds or people in this hemisphere, said **[Dr. Duane J. Gubler (born 1939)]**, the director of the division of vector-borne infectious disease at the Federal Centers for Disease Control and Prevention.

Before yesterday, the illness that has infected at least 14 people in New York City and 4 in Westchester County was believed to be St. Louis encephalitis, which was surprising enough because that disease is rarely found outside the Southeastern United States.

Scores of tests will need to be completed before health officials will be able to say for sure whether the infections were caused by some type of West Nile virus or St. Louis encephalitis. Officials at the C.D.C. said they hope to have the tests completed sometime next week.

But the discovery of the West Nile strain in the birds has cast some doubt on the original diagnosis, officials said. **''West Nile virus is closely related to St. Louis encephalitis, the virus we thought was causing the outbreak,'' [Dr. Duane J. Gubler (born 1939)] said. The discovery of the dead birds, he said, ''has caused some confusion as to whether that is true now.''**

The finding of the West Nile virus in New York stunned experts, who have no theory so far on how the strain found its way here.

If officials confirm that the disease that sickened New Yorkers was the West Nile virus, it would have no practical effect on those who have fallen sick, or on the efforts to control the disease from spreading. Both illnesses are transmitted from birds to mosquitoes to people by the same type of mosquitoes, and the same insecticide would be used.

The symptoms of both illnesses are virtually the same and are usually mild, though in rare cases they can cause neurological disorders and even death.

Experts said those severe cases -- which generally involve the elderly, children under 5 and those with compromised immune systems -- are even less frequent with West Nile virus.

"The important message to get across is that all the public health and responsive measures implemented are the same," said Tom Skinner, a spokesman at the C.D.C.

But from an epidemiological standpoint, the discovery of West Nile virus in New York is remarkable. "This is exciting," Dr. Gubler said. "We prefer it didn't occur, but it is interesting."

"What we are seeing in the waning years of the late 20th century is the transport and movement of these viruses in new areas," he added. "And you get a virus moving into a new area, the entire mosquito population is susceptible."

Yesterday, two elderly women were added to the list of confirmed cases of the mosquito-borne illness. One of the women, who is 90 years old and in critical condition, was the first case to be confirmed in Manhattan since the outbreak began in August. Officials said the woman, who lived near Central Park, apparently contracted the virus in Manhattan, but it was not clear where.

Now, old and new blood samples from people with symptoms, trapped mosquitoes, as well as roughly 450 birds will be examined to see whether the West Nile virus found in the birds was what has caused the New Yorkers to become ill.

It is not surprising that the diagnosis of those who have taken ill could have been mistaken, experts said -- the illnesses appear very similar, and few would have thought to look for an illness whose closest brush with this country was in France in the 1960's. The worst modern outbreak of the West Nile virus was in Romania in 1996, when 90,000 cases were confirmed and 17 people died.

The discovery of the West Nile virus came about in large part by some dogged sleuthing by a head of the department of pathology at the Bronx Zoo, Federal officials said. That pathologist, **[Dr. Tracey S. McNamara (born 1954)], said she became concerned in late July when she heard that a large number of crows had been dying around the zoo. Then, birds at the zoo began to go. Over Labor Day weekend, the zoo lost a Guanay Cormorant, three Chilean flamingos, a pheasant and a bald eagle. Because these deaths followed those of some crows, experts strongly doubt that the disease originated in the zoo.**

Autopsies of the birds revealed streaking in the heart and brain hemorrhages. An equine encephalitis was suspected, but Dr. McNamara was skeptical, because the emus in her care, which are very susceptible to that illness, were thriving.

When two more flamingos died on Sept. 9, she sent samples to laboratories of the United States Department of Agriculture, which ruled out all the common bird viruses. Stymied, they called in an equine virologist to do further testing. The C.D.C. and doctors at an Army lab in Maryland were also sent samples.

Yesterday, the C.D.C. discovered the West Nile virus link.''Everyone was shocked,'' Dr. McNamara said. ''It's possible it came in with a human being or a smuggled bird, and I am not at all certain it will ever be established how it got here.''

The Mayor's Office of Emergency Management, which has been in charge of the spraying, would not comment on the C.D.C. news.

As Westchester County prepared to continue its spraying last night, many Jewish residents voiced concern that such efforts would interfere with the start of the Succoth holiday, which requires observants to sit in an open air tent or hut to take their evening meal.

Victoria Hochman, a spokeswoman for the Westchester County Executive's office, said the agency was aware of the holiday and had contacted regional Jewish centers, "but we have decided it is a health emergency and we have to go with the spraying for the good of everyone." [...]

1999 (Sep 26) - NYTimes : "Exotic Virus Is Identified In 3 Deaths"

By Andrew Jacobs / Sept. 26, 1999 / [HN01I9][GDrive]

The mosquito-borne illness that has killed three people in New York City is not St. Louis encephalitis, but a similar disease that has never before been found in the Western Hemisphere, health officials said early this morning.

Scientists in two states who have been examining brain tissue from the people killed by the outbreak of encephalitis confirmed that it was caused either by West Nile virus, from Africa, or Kunjin virus, a variant that is found only in Australia.

Since last month, 14 people in New York City and Westchester County have been diagnosed with encephalitis, although it was unclear whether the two strains identified today are responsible for all the cases.

An official with the Centers for Disease Control and Prevention in Atlanta, and a researcher at the University of California at Irvine said this morning that the closely related strains had been positively identified in the brain matter of New York City residents killed by encephalitis. Until now, neither strain had been found in birds or people in this hemisphere.

[Dr. Duane J. Gubler (born 1939)], director of the C.D.C.'s division of vector-borne infectious diseases, said that the agency's lab found the West Nile virus in the brain of one of the victims early last week. "It was a total surprise to us," he said. "There was no reason to suspect that we'd find West Nile here."

[Dr. Walter Ian Lipkin (born 1952)], the director of the Emerging Diseases Laboratory at the University of California at Irvine, said his colleagues had identified the virus in the brains of three victims from Queens that had been sent to his lab last week. "It's very odd that they've been found here," he said. "On the other hand, viruses evolve and they have the capacity to adapt themselves." **Dr. Lipkin emphasized that the genetic difference between West Nile virus and Kunjin virus is so slight that the two are practically the same strain.**

Until yesterday, New York health officials said they had found the West Nile virus only in birds that had died in and around the Bronx Zoo. But this morning, after the C.D.C confirmed the discovery of the virus in humans, a state official acknowledged that officials had known about the findings of [Dr. Walter Ian Lipkin (born 1952)] and Dr. Gubler for several days, but wanted to conduct more tests.

John Signor, a State Health Department spokesman, said the ageny was planning to release the information tomorrow after more testing confirmed the earlier findings. "The identification of a virus is a complex process," he said. "We felt more testing needed to be done."

Despite the discovery that the encephalitis outbreak had been caused by a different virus, officials said that the public health measures undertaken to date would not change: the spraying of mosquitos and warnings to reduce exposure to the insects remains. Mr. Signor said that the treatment for those already infected with the disease would remain the same.

The Federal Centers for Disease Control and Prevention said Friday night that its scientists had identified a West Nile-like virus in four birds from New York that they had tested in their laboratory in Fort Collins, Colo.

The birds included two flamingos and an Asian pheasant from the Bronx Zoo, and a crow reported to be from Scarsdale, said Kristine Smith, a spokeswoman for the New York State Health Department.

Yesterday, city health officials continued collecting dead birds, which they had started to do on Friday. Special telephone lines and asked residents to call in sightings of dead birds. By 4 P.M. yesterday, the City Health Department had received two dozen reports of dead birds in all five boroughs, and sent out staff members from its pest control division to retrieve specimens, said a spokeswoman, Sandra Mullen.

"The birds will be kept on dry ice and brought to our Bureau of Laboratories," she said, adding that most of the dead birds reported were crows, which have been dying in large numbers since the beginning of the outbreak. Health officials in Suffolk County collected five dead crows on Friday, and sent them for analysis to the State Department of Environmental Conservation yesterday, said the director of public health, Mahfouz Zaki.

And after receiving reports at 5:30 P.M. on Friday that earlier samples from dead crows tested positive for an encephalitis-like disease, they sprayed South Huntington and Huntington Station with pesticides.

In Manhattan, a team from the Parks Department swept through Central Park on Friday night searching for dead birds but found none, said Parks Commissioner Henry J. Stern. He said that more teams would be dispatched, but that all park staff members had been notified and were on the lookout.

News that the infection was either West Nile virus or an Australian variant has deepened an epidemiological mystery that began in July with the deaths of numerous crows around the Bronx Zoo.

A pathologist at the zoo, [Dr. Tracey S. McNamara (born 1954)], first noticed that large numbers of crows were dying, reaching 40 by August. Then, birds at the zoo, including a guanay cormorant, three Chilean flamingos, a pheasant and a bald eagle, died.

Though the symptoms of both diseases are similar, and the steps to combat them are the same, the mosquitoes that carry them can differ, health officials said.

Ms. Smith of the State Health Department said the mosquitoes that carry St. Louis encephalitis and West Nile viruses, the Culex pipiens, are generally active from dusk to dawn. But another type of mosquito known to carry the West Nile virus, the Aedes vexans, is also active during the day, she said. [...]

1999 (Oct 03) : Ian Lipkin vs Gubler

ANCIENT DISEASE

More questions than answers as scientists battle encephalitis

By SUSAN FERRARO
SUNDAY NEWS STAFF WRITER

Brilliant medical sleuths tracked down the surprise virus that's killing New Yorkers, but larger mysteries of how an exotic illness never before seen in the United States got here — and what to do about it — remain unsolved.

The outbreak in New York of West Nile virus, which causes deadly encephalitis, an inflammation of the brain, is the first of what may be an unending march of tropical killers on Western shores.

Scientists can't say how long the current siege of West Nile virus will last, exactly which insects are transmitting it from birds to humans, how virulent it is or even if global warming plays a role.

"As a virus, it is extremely promiscuous, which means it has multiple hosts: people, different birds, different mosquitoes and ticks," said Dr. Dickson Despommier, a microbiologist at Columbia University. "That makes it very complex biology. No one knows what will happen next."

CRACKING THE CASE

Scientists suspect the West Nile virus caught a ride on a jet plane from foreign climes — most likely Africa or Asia — a stowaway pathogen coursing through the blood of imported exotic birds or human travelers.

The West Nile strain comes from Africa and Asia, where it lives harmlessly in birds. It is a vector-borne disease: To be transmitted to a human, it needs a go-between — probably the common house mosquito.

In late July and August, some Queens residents began exhibiting encephalitis-like symptoms. Officials suspected the St. Louis strain, one of four flaviviruses spread by mosquitoes in the United States.

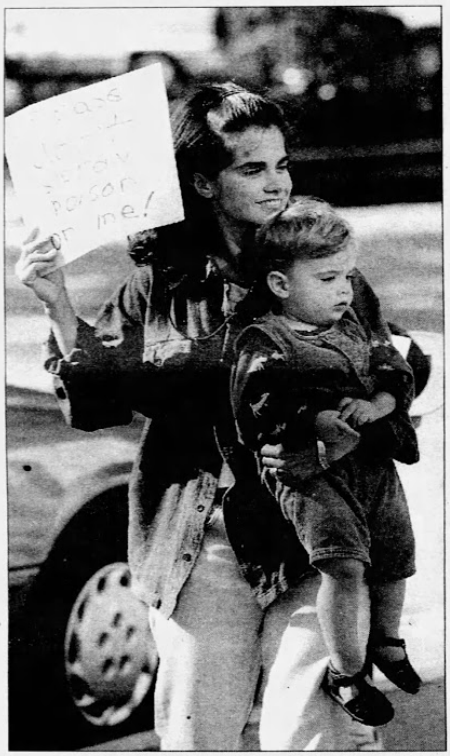
It was big news: St. Louis virus had never been found in the city. Officials at the federal Centers for Disease Control and Prevention in Atlanta confirmed the diagnosis when enough cases showed the antibody reaction characteristic of the virus.

The CDC did not look for West Nile — which has the same symptoms, produces similar antibodies and triggers identical results in standard lab tests — because it is unknown here, and generally viruses stick to their own geographical areas.

Still, puzzles lingered: Not everyone who got sick tested positive for St. Louis virus. And birds were dying, among them black crows — known to be susceptible to West Nile — and, at the Bronx Zoo, flamingos, a snowy owl and other exotic birds.

Zoo pathologist Dr. Tracey McNamara wondered why and packed samples off to a federal agricultural lab in Iowa. Scientists there found signs of a flavivirus, which birds can carry. McNamara suspected something new because the birds were dying. She had the specimens sent to the CDC for more testing.

Meanwhile, on Sept. 13 in Albany, the New York State Department of Health convened experts in encephalitis — not because of the Queens outbreak, but to discuss unrelated New York encephalitis cases.



KEVIN P. COUGHLIN

One participant was Dr. Ian Lipkin of the University of California at Irvine, an expert in emerging diseases. He has invented a molecular diagnostic tool that he will not patent but will make available to all ("This is my last attempt to get into heaven," he says).

State Health Department researchers Dr. Cinnia Huang and Dr. Leo Grady were intrigued by Lipkin's work, and when talking about the Queens outbreak later, the group wondered if it might be something other than the St. Louis virus.

Lipkin took human tissue samples from the Queens outbreak back to Irvine and nailed the culprit two days later: West Nile virus. Called an unsung hero by one New Yorker who was privy to the discovery, Lipkin stepped back while state officials coordinated with the CDC to announce the news.

BREAKING THE NEWS

Dr. Duane Gubler, the CDC's top expert in vector-borne infectious diseases, broke the news and credited McNamara too. Almost simultaneously, other CDC scientists had found the West Nile virus in her birds.

Lipkin's discovery completely changed the scope and implication of the New York epidemic. Overnight, the number of deaths went from three to four, all of them age 60 or older, and the total who were affected more than doubled.

By the weekend, there were five deaths, a sixth suspected death and 48 "laboratory-positive" cases — most in Queens but also in the Bronx, Brooklyn, Manhattan and Nassau and Westchester counties.

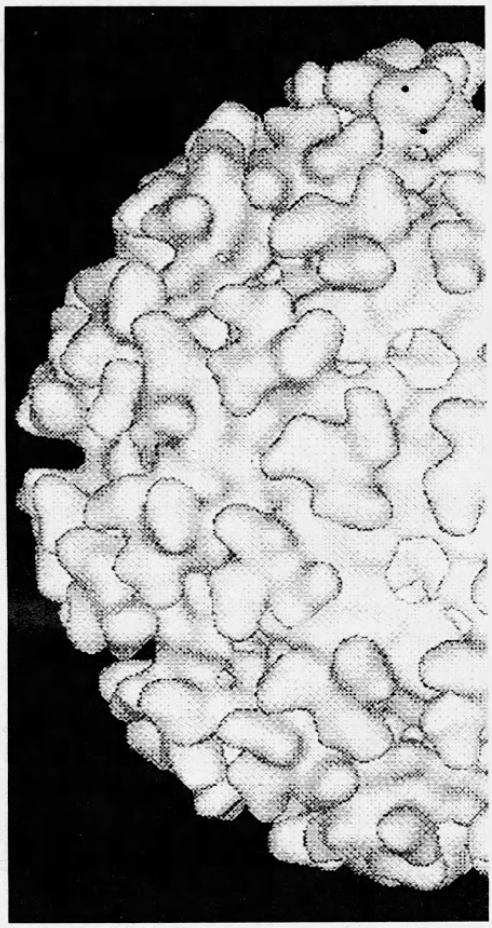
When St. Louis virus strikes, the death toll is about 5% of the total number of confirmed cases, said Dr. Jonathan Day, an expert in medical entomology at the University of Florida and a leading encephalitis expert.

If West Nile is the same and the deaths hold at six, the number of confirmed cases would top out at 120.

As for how long the epidemic will last, Day said knowing when the most recent victim fell ill is a clue. "From the date of onset, go back 10 days. Say it was Sept. 22; go back to Sept. 12, so you will know it was still going then."

Cooler nights slow mosquitoes, and the first frost — usually by mid-November — will send them packing for the season. But no one knows if the virus will return in the spring.

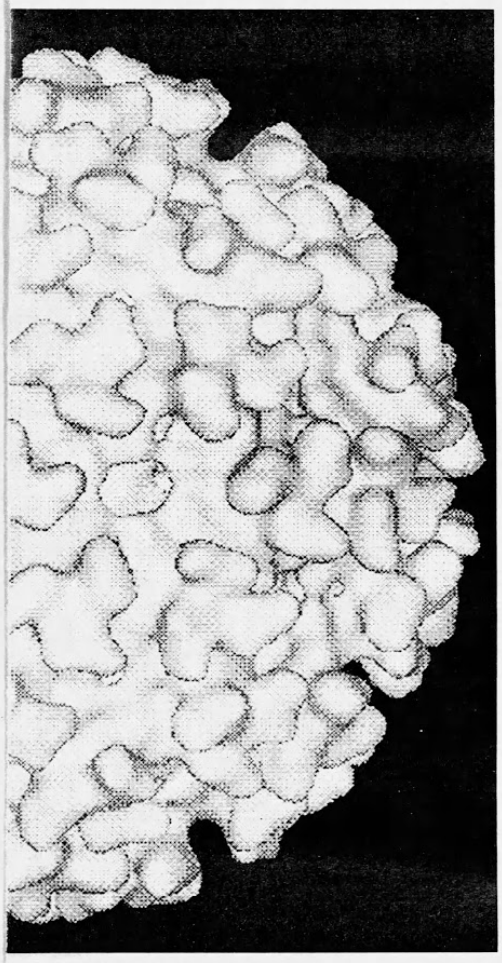
To find out, scientists and

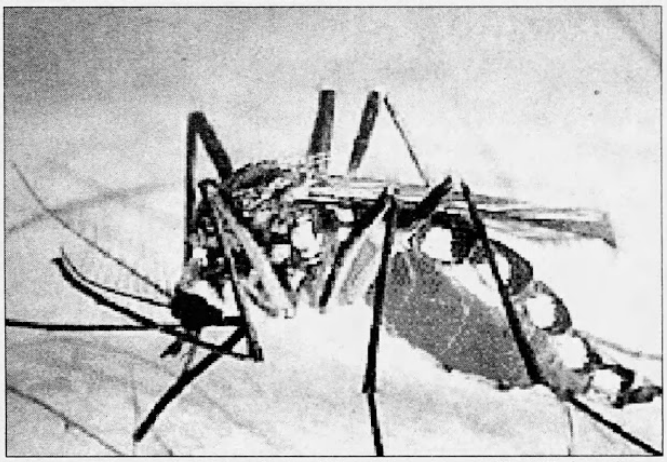


PUBLIC ENEMY **Alphavirus (above) borne by mosquitoes has sparked fear. At a demonstration Friday in Mineola, Carrie Jaskowski of Bayside, Queens, totes her 18-month-old son, Oliver, and a sign protesting spraying of pesticides on Long Island.**

[HN01L5][GDrive]

IS ON THE MOVE





Aedes mosquito — marsh variety or its tree-hole cousin — may carry West Nile fever virus.

Danger signs of West Nile fever

Most mosquito bites do not cause disease. And many people who get sick recover quickly from what seems like mild flu. But St. Louis encephalitis and its close cousin West Nile fever can worsen and kill the young, old or those with weakened immune systems.

Symptoms include:

Fever, lethargy and headache.

Rarely, inflammation of the brain, delirium, memory loss, seizures, death; in some cases, a stiff neck.

If you have mosquito bites and worrisome symptoms, consult a doctor. Diagnostic tests include blood tests, MRI (magnetic resonance imaging) and analysis of spinal fluid. In the rare cases of brain swelling, corticosteroids can help.

health officials have six months to study the virus, watch its progress as birds fly south and plan an attack if it returns. A key piece of the puzzle is the role played by the birds — living and dead.

BIRD BRAINS

Since August, birds have been dying in unusual numbers. If West Nile virus, supposedly milder than St. Louis virus, is responsible, that could indicate an especially virulent strain, since it does not kill birds in Africa and Asia.

So far, there are reports of 732 dead birds, 180 in the city. Pathologists have found West Nile in birds from Connecticut, Rockland, Suffolk, Nassau and Westchester counties and McNamara's zoo specimens.

Infected birds die the way people do, of brain inflammation, said Dr. Barry Hartup at Cornell University in Ithaca. But the rising bird body count may not be linked to the West Nile epidemic alone.

"In fact, 732 dead birds is not a lot in this area," said John Bianchi of the Audubon Society. Some 1,000 birds die in New York City every day after slamming into buildings, he said, especially on overcast autumn days when they can't see the stars and building lights dazzle them.

Migration causes birds stress, and autumn is peak migration season. The summer drought together with a five-year population increase among crows threatens that species in particular, said Ward Stone, New York State wildlife pathologist.

Finally, malathion — the chemical liberally sprayed over the city since September to kill mosquitoes — probably doesn't hurt birds directly, Hartup said, but acute poisoning by it is possible if birds eat contaminated insects.

From birds, West Nile virus is probably transmitted by *Culex pipiens*, the house mosquito — the same bug that carries St. Louis virus, which means that spraying can be equally effective for both viruses.

But like everything else in this epidemic, that, too, may change. "There are two good other possibilities," said Despommier: the salt marsh mosquito (*Aedes solicitans*) and the treehole mosquito (*Aedes tarsalis*).

Identifying the go-between agent is essential: Spraying deters salt marsh mosquitoes, which can travel about 40 miles — much farther than the one-mile lifetime limit of the house mosquito — but won't touch the treehole variety.

BUG GO-BETWEEN

In Africa, ticks are a nasty, persistent vector of West Nile virus. Most experts do not implicate them here. But it is possible, and ticks can live several years, said Dr. Mahfouz Zaki, an expert in West Nile virus who heads the Public Health Department in Suffolk County.

A final West Nile vector may be humans. Unlike St. Louis virus, West Nile has a higher viremia — concentration of virus in the blood — which means mosquitoes could pick it up directly from one person and pass it to another.

The virus has been found in humans in Israel, Romania and Uganda. "A person in those places who was bitten just before they went to New York, and five to seven days later felt sick, that's where it could have begun," said the University of Florida's Day.

"Could it have been one person?" Hartup asked. "It seems unlikely, but anything is possible."

WHY AND WHERE

Discovered in Uganda 62 years ago, West Nile virus broke free of its usual haunts in 1996 when it erupted in Romania, making 393 sick and killing 17, all over age 50. There's a Russian outbreak going on now, though little news of it has filtered out to the West.

Environmentalists think global warming could be a factor in this sudden spread. Mosquitoes thrive in warm, wet winters and hot, dry summers, said Dr. David Rind, a climate researcher at the National Aeronautics and Space Administration and Columbia University's Goddard Institute for Space Studies in Manhattan.

But there may be no connection with this outbreak, he said. North America has been cooler than the rest of the world during most of this century, said Dr. Gavin Schmidt, also at the Institute, and is only now catching up with Europe.

What scientists do know is that jet travel transports germs around the globe in hours, and a major port city such as New York — also home to many immigrant populations and frequent world travelers — is an obvious landing spot.

Tropical diseases already showing up in American emergency rooms include dengue from Mexico, bubonic plague found in ground squirrels and drug resistant tuberculosis, said Amherst College biologist Dr. Paul Ewald.

Mosquito-borne diseases are fairly easily controlled here because of good housing — bugs can't bite what they can't touch. But as New York wrestles with its epidemic, the 1999 West Nile virus is teaching hard lessons.

"Everything is here," said Zaki of Suffolk County, and the "luxury" of living in a country free of tropical diseases is past. "Now we have to take a different look and be aggressive in management and control."

That means surveillance of birds, bugs and humans — noting when and where mosquitoes flourish, checking bird health, watching for signs of human encephalitis along the bird migratory paths — and constant cleanup, Despommier said.

It's hard work — what researchers call "shoe leather epidemiology," he said. Those who graduate from the CDC's elite Epidemiology and Intelligence Service are given a yellow tie with blue shoes on it — "and one shoe has a hole in it."

DAILY NEWS Sunday, October 3, 1999

[HN01L6][GDrive]

1999 (Oct 11) - NYTimes : "In New York Outbreak, Glimpse Of Gaps in Biological Defenses"

By Jennifer Steinhauer and Judith Miller / Oct. 11, 1999 / [HN01IB][GDrive]

On Sept. 23, nearly three weeks after **Mayor Rudolph W. Giuliani** announced that New York was being attacked by a mosquito-borne virus often found in the Southern United States, senior Federal health officials convened a conference call to hear some startling news.

The scientist who initially identified the virus as St. Louis encephalitis said he had changed his mind, an official who was present said. It was probably a form of West Nile virus, a disease never before seen in the Western hemisphere.

Stunned by the sudden turn, senior officials at the Federal Centers for Disease Control and Prevention peppered their colleague with questions. Was he sure? What testing was done? Was it repeated?

The officials decided not to inform New York of the new finding immediately. They sent the scientist, **[Dr. Duane J. Gubler (born 1939)],** back to his laboratory in Fort Collins, Colo., to do more tests. He reconfirmed the conclusion, and the next morning, calls went out to New York City.

Federal public health officials were chagrined but not overly worried by the sudden switch in diagnosis. West Nile virus is slightly less virulent than St. Louis encephalitis, and the city was already eradicating the mosquitoes that transmitted the disease, whatever it was.

But the announcement caused concern among many of the scientists and Government officials who are working to strengthen the nation's defenses against biological warfare. They saw the New York outbreak as a dress rehearsal, a test of how public health officials could detect and deal with the sudden spread of a disease not typically found in the United States. To them, the missed diagnosis was unnerving.

''The encephalitis outbreak in New York is a powerful lesson for public health authorities,'' said Alan P. Zelicoff, a senior scientist at the Federal Center for National Security and Arms Control at Sandia National Laboratories in New Mexico. ''It is a sobering, not so reassuring, demonstration of the inadequacies of the U.S. detection network for emerging diseases.''

Local and Federal officials agree there is much to be learned from New York's experience that can be applied equally to defense against biological warfare and the emerging need to deal with the global spread of virulent disease.

While the public health system performed well in many regards, officials point to several key missteps. For instance, in testing samples from the initial victims, the C.D.C. screened only for six viruses common in this country. The scientists did not test for several that have been linked to foreign epidemics or germ warfare.

In addition, the scientist holding a key clue to the true identity of the virus, a bird specialist who had noticed the unexplained deaths of crows near the Bronx Zoo, could not get anyone at the C.D.C. to return her calls for a week. In the end, she turned to several other Government laboratories, including a military research center, to confirm her suspicions that the C.D.C. had the wrong virus.

Finally, the myriad state, local and Federal agencies involved in the investigation did not always communicate well with one another.

''We've learned about the need for, and benefits of, improvements in laboratory coordination,'' said Scott Lillibridge, who leads the C.D.C.'s Bioterrorism Preparedness and Response Program. ''We've also learned how helpful surveillance can be, particularly in beginning to track the beginning, extent or progress of an infectious disease outbreak.''

Over the past several years, the Federal Government has invested hundreds of millions of dollars on a national program to defend against biological terrorism. Several officials said that in light of New York's experiences, much more money should be invested in the public health systems detecting epidemics.

The Discovery : 2 Elderly Patients Sound an Alarm

On Aug. 23, **Dr. Deborah S. Asnis,** an infectious disease specialist at Flushing Hospital Medical Center in Queens, called the city's Health Department with some distressing news -- two elderly patients had come in with symptoms that looked like a neurological illness -- fever, muscle weakness and confusion.

[Dr. Marcelle C. Layton (born 1958)], who heads the Health Department's Bureau of Communicable Diseases, told **Dr. Asnis to send samples to the State Department of Health**, and then called the C.D.C. to warn them that something -- maybe botulism -- was happening in New York City. As the week went on, the number of sick people was starting to mount.

The case was assigned to Dr. Gubler, one of the C.D.C.'s experts on diseases spread by insects. His suspicions focused on St. Louis encephalitis, which is often found in the Southeastern United States.

To confirm his theory, **[Dr. Duane J. Gubler (born 1939)],** tested the samples for antibodies against six viruses transmitted by insects and commonly found in the United States. The tests came back positive for St. Louis encephalitis, a close relative of West Nile fever.

The C.D.C. announced on Sept. 3 that tests of blood and spinal fluid had confirmed Dr. Gubler's suspicion. The Mayor called a hasty news conference in Queens. His office of emergency management took the helm and began a $6 million campaign to wipe out New York's mosquitoes.

Within days, New York City had practically cornered the nation's supply of insect repellent, and 250,000 brochures about the disease were printed and distributed, along with the free repellent, by 500 city employees.

And New Yorkers quickly began to debate which thing unknown to their region they feared the most -- St. Louis encephalitis, or malathion, the insecticide that began to rain down from clacking helicopters.

At the Bronx Zoo, officials were worrying about what seemed to be a serious, but separate biological event. Since July, zoo officials had been receiving calls from people in the Bronx and Queens about dead birds. Four days after the city's St. Louis encephalitis announcement, several exotic birds at the zoo were dead. But not emus. And that made **Tracey S. McNamara** nervous.

Dr. McNamara, who is the head of the department of pathology at the zoo, knew that St. Louis encephalitis, which is carried by birds and transmitted through mosquitoes, does not normally kill the birds.

She considered the possibility that the birds were being killed by another common form of encephalitis. But that disease is deadly to emus, which were thriving. Something much more complicated was afoot, she reasoned.

The pathologist took to her lab, spending 12 hours a day analyzing bird samples. What she found was so disturbing, she said, that she called the C.D.C to alert them. The dead birds were bleeding from the brain and had badly damaged hearts. Was a similar virus infecting people?

"We had dead people and dead birds and I thought we needed to pursue this," she said.

She also contacted the National Veterinary Services Lab in Ames, Iowa, part of the United States Department of Agriculture, to study the samples. Around the same time, Ward Stone, the chief wildlife pathologist for the State Department of Environmental Conservation, began noticing large numbers of dead crows, and alerted his counterparts in New Jersey and Connecticut that something strange was happening to the local bird

population.

While the C.D.C. agreed to take some of Dr. McNamara's samples, agency workers then did not return her daily calls for a week. "I got voice mail," she said. In fairness, she acknowledged, dead people were taking precedence.

But the agency seemed slow to grasp the possible link to the birds' illness. Dr. McNamara is circumspect about criticizing her colleagues at the C.D.C., but she said, "I would say a lesson to be learned was that there was some tunnel vision."

In the Federal Government's dress rehearsals of how a city might detect and handle a sudden outbreak of disease, officials had foreseen many different scenarios. But no one had anticipated an outbreak in which crucial evidence would be uncovered by a wildlife specialist.

"How we respond to introduced diseases in the wildlife perspective is not very well resolved," said Michael Samuel, a research project leader at the National Wildlife Health Center, a unit of the Department of Interior, which is also researching New York's outbreak. "I don't know that we as a nation have a contingency plan in place."

Dr. Stephen Ostroff, the acting deputy director for science and public health at the C.D.C., said that confusion is a normal part of an emerging diseases investigation.

"Anyone who continues to maintain that there was some mistake here doesn't understand the way science proceeds in outbreak investigations," Dr. Ostroff said. "You won't hear any apologies from me." He said he was not aware of Dr. McNamara's repeated attempts to reach C.D.C. officials.

The Breakthrough : Military Minds Turn to Outbreak

Back in the Bronx, Dr. McNamara was getting impatient. The veterinary lab in Ames had already exhausted its capabilities, but could not specifically identify the strange virus that was killing the birds.

Dr. McNamara sent more samples to the C.D.C., but she also put in a call to the United States Army Medical Research Institute of Infectious Diseases, looking for a favor.

Could the laboratory, which does not usually get involved with civilian requests, take a peek at her samples? Dr. McNamara, it turned out, had some chits to call in. She had recently attended the wedding of the pathologist who performs such tests. The lab agreed to take a look.

The system was working, after a fashion. The military's finest minds on bioterrorism had turned to New York's outbreak.

On Sept. 21, Dr. McNamara sent the samples to the lab by overnight mail. Within a day, the Army's unit, which is based in Fort Detrick, Md., confirmed that a virus of a very different sort was killing birds.

Meanwhile, the C.D.C. was beginning to make the connections. On the same day, officials at the agency called Dr. McNamara and said they wanted more material. She sent it out that evening.

On Sept. 24, scientists at the Army lab told her that the tests of bird samples for West Nile virus "really lit up," Dr. McNamara said.

The C.D.C., with help from each of the labs involved, had come to the same conclusion. That day, the agency announced that birds were dying in New York City, and a West Nile-like virus was the reason. The scientists strongly suspected that the humans had been killed by the same virus, but had yet to confirm it.

The answer came, strangely enough, from California. The New York State Department of Health, without telling the C.D.C., sent some of the brain tissue from people believed to have died of St. Louis encephalitis to a lab run by [Dr. Walter Ian Lipkin (born 1952)], a scientist at the University of California in Irvine who had bumped into state scientists at a conference in Albany.

On Sept. 24, [Dr. Walter Ian Lipkin (born 1952)] found that a form of West Nile virus -- which the C.D.C. now believes is similar to a strain previously found in Europe -- had sickened the New York patients. Soon after, the C.D.C. reached the same conclusion.

The words "West Nile virus" had little significance in New York. But in Washington, they raised red flags among American intelligence officials who follow bioterrorism, an incident reported by this week's New Yorker magazine.

In April, a supposed associate of Saddam Hussein published a book in Britain in which he claimed that the Iraqi leader had threatened in 1997 to unleash a form of West Nile virus against his enemies.

A closer look at the Iraqi biological weapons program found no evidence that Baghdad had ever experimented with the virus and intelligence officials, along with arms inspectors who had visited Iraq's laboratories, concluded the report was baseless.

Last night, the C.D.C. issued a statement saying it believed the West Nile outbreak was the work of "Mother Nature."

The eerie coincidence underscored what officials said was a new reality.

"Sadly the world has changed. The threat of bioterrorism is real and growing," said Dr. Margaret Hamburg, an assistant secretary at the Department of Health and Human Services who was previously head of the New York City Health Department. "Whenever a new or unexpected disease emerges in an outbreak such as this, it would be irresponsible not to at least consider the possibility of bioterrorism."

Congress, the officials said, has been slow to spend money on detecting outbreaks, even as they invest hundreds of millions in other bio-defense efforts and vaccines.

This year, lawmakers for the first time approved $120 million to strengthen the C.D.C.'s programs for education and monitoring disease. However, the $40 million set aside for improving state and local health detection was only disbursed late last month, as a West Nile-like virus was spreading through New York.

"We're spending hundreds of millions on questionable stockpiles of vaccines and antibiotics," said Dr. Zelicoff, the scientist at the Sandia Laboratory. "We should be improving the ability of local public health officials to recognize and report strange illnesses to a central authority that can quickly tell them what to do about it."

Inspectors find security lapses at local CDC lab

By The Associated Press

Inspectors have uncovered security lapses at a federal laboratory where scientists are studying deadly bacteria in Fort Collins.

In the wake of the Sept. 11 attacks, the federal Centers for Disease Control and Prevention laboratory has clamped down on access to its biological agents, established around-the-clock patrols and decided to erect a new security fence, director Dr. Duane Gubler said.

However, CDC inspectors visited the lab on the grounds of Colorado State University several weeks ago and found security lapses, Gubler said Friday.

Neither he nor other federal officials would elaborate.

The findings will be included in a report about security at CDC labs and National Institutes of Health facilities across the country.

Health and Human Services Inspector General Janet Rehnquist briefed Congress on the findings Wednesday in a closed-door hearing. The information will not be released to the public.

"We don't want people who might do harm to the government to learn about the strengths and weaknesses of the labs," HHS spokeswoman Katherine Harris said.

Gubler said the CDC has known about security shortcomings at the Fort Collins facility, the Division of Vector-Borne Infectious Diseases, for a long time and has been working to address them.

U.S. Rep. Bob Schaffer, R-Colo., said it will take millions of dollars to bring the aging facility up to standards.

"There are needs for modernization and improvement, not just on the security level but also from a functional standpoint," he said.

Researchers at the lab work with the microbes that cause plague, tularemia, West Nile virus, dengue, yellow fever and various forms of encephalitis.

Plague and tularemia both respond to the same antibiotics used to treat anthrax.

About 90 federal employees and several dozen contract employees work at the lab, which moved from Greeley to Fort Collins in 1967.

2001 - Dengue and West Nile Virus—An Interview with Duane Gubler, Sc.D.

VECTOR BORNE AND ZOONOTIC DISEASES, Volume 1, Number 1, 2001 (PDF : [HP006B][GDrive])

Dr. Gubler is the Director of the Division of Vector-Borne Infectious Diseases of the National Center for Infectious Diseases, the Center for Disease Control and Prevention in Fort Collins, CO. He has academic degrees in entomology and zoology (B.S.) from Utah State University, parasitology (M.S.) from the University of Hawaii, and pathobiology and tropical disease ecology (Sc.D.) from the Johns Hopkins University. Dr. Gubler has spent his career studying vector-borne diseases and has extensive field experience in Asia, the Pacific and Caribbean islands, Central and South America, and Africa. He has worked on dengue and dengue hemorrhagic fever for 29 years, and he co-developed the mosquito inoculation and immunofluorescent techniques that allowed for routine virologic confirmation of clinically diagnosed dengue cases. He used these methods in Southeast Asia to develop the first virologic surveillance for dengue hemorrhagic fever and to help to clarify the clinical spectrum of illness associated with dengue virus infection. Dr. Gubler also pioneered the field of mosquito vector competence and was the first to show that geographic variation in susceptibility to dengue viruses occurred among strains of both Aedes aegypti and Aedes albopictus. In the Caribbean, he directed the development of the CDC dengue laboratory, which now serves as a world reference laboratory for diagnosis, surveillance, prevention, and control of epidemic dengue. During this period, Dr. Gubler pioneered the concept of active disease surveillance and community-based, integrated mosquito control as the most effective approach to preventing epidemic dengue/dengue hemorrhagic fever. Dr. Gubler has coordinated major emergency responses to epidemics of vector-borne diseases, including the 1994 plague epidemic in India and the 1999 West Nile virus epidemic in the northeastern United States. He holds adjunct academic appointments as professor of microbiology at Colorado State University and professor of international health at the Johns Hopkins University School of Public Health and Hygiene. He is a Past President of the American Society of Tropical Medicine and Hygiene.

Please describe the mission of your laboratory in terms of mosquito-borne viruses.

We are responsible for all vector-borne infectious diseases, which include viruses and bacteria. In our division, we have four World Health Organization Collaborating Centers for Reference and Research: one each on arboviruses, plague, Lyme disease, and dengue hemorrhagic fever. Our mission is to monitor these vectorborne infectious diseases around the world, to provide consultation and advice to agencies from the local level to the international level, to conduct surveillance on a global basis, and to provide reference and reagent services for laboratories around the world. We also carry out research on ways to improve surveillance and to develop more effective strategies for prevention and control of these diseases, although we don't actually implement the control ourselves. Our laboratory-based research, which is primarily applied research, focuses on the development of improved diagnostics and immunogens.

How would you describe the global threat from mosquito-borne viruses in particular?

In terms of vector-borne diseases, you have to look at the current status from the perspective of what has happened over the past 50 years. By about 1970, we had effectively controlled many of the important vector-borne diseases. We went into the 1970s and 1980s in a rather complacent mode, with this effective control behind us. The policy- and decision-makers essentially redirected the resources that had been used for vector-borne diseases to other, higher-priority and competing areas. We saw the support for research on vector-borne diseases dry up during the 1970s, 1980s, and 1990s. Concurrently, during that 30-year period, we also saw many global demographic and societal changes that were conducive to the spread of infectious diseases in general, and vector-borne diseases in particular. In the past 20 years of the 20th century, from about 1980 to the present time, we have seen a dramatic resurgence of infectious diseases. The vector-borne viral diseases are among the most important of those. An example is dengue hemorrhagic fever, which is, without question, the most important vector-borne viral disease of humans. It was effectively controlled 30 years ago, but recently it has spread globally throughout the tropics. In 2001, more than half of the world's population, between 2.5 and 3 billion people, live in areas of risk for dengue. We estimate that every year there are between 50 and 100 million cases of dengue fever and several hundred thousand cases of dengue hemorrhagic fever, the more severe form of the disease, depending on epidemic activity. Other vector-borne viral diseases provide similar examples; Japanese encephalitis, which has also been resurgent in the past 20 years, is one. It is primarily a Southeast Asian disease, but we have seen it move into West India and Nepal, south into Papua New Guinea and northern Australia, and east into the Pacific. In addition, diseases such as West Nile, which have never been major public health problems, all of a sudden show up in places like New York and the northeastern United States to cause major outbreaks. It is a sign of the times, with the changing demographics and societal behavior, and the increased movement of people, animals, and commodities via modern transportation into areas that do not have the public health infrastructure to deal with vector- borne diseases. We have seen a major increase in epidemic activity associated with many of these viral diseases. For yellow fever, we have the most economical, effective, and safe live virus vaccine available. Yet yellow fever is potentially one of the most important emergent diseases in the next 10 years, primarily because large areas of the American tropics have become reinfested with Ae. aegypti, the principal urban vector. Once urban yellow fever transmission starts in Latin America, we expect this virus to move very rapidly into the Pacific and Asia via modern transportation. Yellow fever could become the next global public health emergency if we don't do something to reverse that trend. The unfortunate thing is that like dengue hemorrhagic fever in the Americas, we can see it coming and have the ability to prevent its occurrence, but we are sitting by and doing nothing. Arboviral diseases, in general, are among the most important emergent/resurgent infectious diseases that we will have to deal with over the next 10–20 years.

What are the priorities for the CDC?

The National Center for Infectious Diseases, of which we are one division, has developed a plan to deal with emergent infectious diseases. We have four primary areas of focus: surveillance and response, applied research, infrastructure and training, and prevention and control. We have identified a number of priority areas, including vector-borne and zoonotic diseases. Our priority over the next 10 years is to try and develop more effective surveillance, prevention, and control in the United States at the local, state, and federal levels to deal with vector-borne diseases. We are also working closely with international partners to develop more effective surveillance, prevention, and control programs in endemic and enzootic areas outside of the United States. The rationale is that if we can develop better partnerships in endemic areas, we can develop more effective global surveillance, and it would be less likely that diseases would be introduced into the United States and cause major epidemics here. We are focusing on prevention, rather than waiting for the epidemics to occur and then trying to respond to them.

What do you see as the major threats to the United States in terms of vector-borne viral diseases in the next decade?

Right now, the biggest threat would be the geographic spread of West Nile virus. It appears to have become established in this country, and because it is maintained in a mosquito–bird cycle, and a lot of the birds that are infected are migratory, it is possible, if not likely, that this virus will move south, then

move back north, and ultimately become established in most of the United States. It has important health implications in terms of human disease, of course, but it also has very important animal implications for the veterinary community. It has a very high fatality rate in horses, for example. The unique thing about this virus is that it has a very broad host range. It infects not only a large number of birds, but also a number of mammals; we don't yet understand the full implications of the introduction of this virus. The emergence of West Nile virus in the Western Hemisphere also represents an opportunity, a wake-up call, to warn us that we are not prepared for these kinds of introductions and that we must get on with the job of rebuilding the public health infrastructure and the research capacity to deal with vector-borne diseases that were controlled in this country 30 years ago. Other threats include several local viruses that have been here for many years. In dealing with the West Nile virus, we will also deal with them, but I don't see them as major threats in the future. Of the introduced viruses, we have dengue, which is introduced into this country repeatedly every year, with the numbers of cases introduced dependent on the amount of epidemic activity occurring in tropical areas. In recent years, we have seen increased transmission of dengue in the United States. We have two good vectors for the virus here, Ae. aegypti and Ae. albopictus, so the potential is always there for an outbreak of dengue fever in this country, especially in the southern tier of Gulf Coast states. Another potential problem for the United States is yellow fever. We used to have major outbreaks of both dengue and yellow fever in this country—they are both transmitted by the same mosquitoes in urban areas—so yellow fever is also a potential threat even though we have an effective vaccine for this virus. The key to eliminating the yellow fever threat is to use that vaccine effectively. Ideally, we would like to see the control of the mosquito vectors, but that will probably not happen any time soon. There are other arboviruses that could be introduced into this country. As I said, West Nile virus was a wake-up call, because other closely related viruses could cause similar types of problems— Japanese encephalitis is one of them. We have the mosquito vectors here that can transmit this virus. In addition, three very good mosquito vectors have been introduced into the U.S. since 1980: Ae. albopictus, which came sometime in the early 1980s; Ochlerotatus (Aedes) togoi, which was introduced into the northwest part of the country in the 1990s; and most recently, Ochlerotatus (Aedes) japonicus, which was first detected in 1998. We cannot predict what the next major introduction of an exotic agent might be. West Nile virus was the last virus we expected to be introduced into the United States. The takehome message is that we need to be prepared for the unexpected.

Are vaccines a realistic and reasonable strategy, or should surveillance and mosquito control be the primary approach to prevention?

Let's take vaccines first. Yes, vaccines are a realistic way to prevent disease, provided they are used properly. The yellow fever vaccine is a good example of a very economical and effective vaccine that is not effectively used. If we have vaccines, and they are not used, they are worthless. If we are going to put money into the development of vaccines, we have to be sure they are going to be used effectively.

What has prevented the yellow fever vaccine from being used effectively?

The main obstacle is competing priorities for limited resources. If you don't have an endemic disease, then the decision-makers usually take the limited resources and put them into areas where they are needed the most. While that may seem logical, with diseases such as the mosquito-borne diseases, which can resurge so quickly, it doesn't make sense. This is what happened with malaria as well. It is unlikely that we will ever eradicate the mosquito vectors, so we are always at risk for epidemics of these diseases. We need to educate the policy-makers about this ongoing risk and convince them to maintain the prevention methods indefinitely. If a vaccine is available, we need to maintain a high level of herd immunity in the population to prevent potential future epidemics. If mosquito control is the primary method of prevention, then we need to maintain that infrastructure to prevent transmission. The problem is that in the past 30 years, we have relied too much on surveillance and emergency response, as opposed to disease prevention. Surveillance is a critical component of any prevention strategy, but you must have a follow- up with sustainable programs in place to implement control to prevent subsequent human disease. Once you have an epidemic on your hands, it's generally too late. We need renewed emphasis on rebuilding capacity for vector-borne diseases, and that requires vector surveillance and understanding which species are present, where they breed, the seasonal distribution, and how these species' population densities respond to seasonal and other environmental conditions. It also requires surveillance to identify viral activity in the community. It has to be an ongoing program at the local level, and it has to be supported indefinitely. We are not going to eradicate mosquitoes or ticks, but that is not what people want to hear. These days many people want a "quick fix," a magic bullet. That's why vaccines are so popular, because they don't require any responsibility on the part of the individual. We have to go back to the thinking of 50 years ago, when people accepted some responsibility for disease prevention and helped public health authorities. We need the help of the people in the community if we're going to be successful in developing sustainable prevention programs for vector-borne diseases.

What hope is there for genetic modification of any of these mosquito species to make it more difficult or impossible for them to be vectors for infectious organisms?

There is always that hope. The manipulation of vector species to make them resistant to infection or less effective vectors can take a lot of forms: You can change their blood-feeding habits, for example, or genetically manipulate them so that the virus cannot replicate efficiently if they do become exposed. I certainly don't discourage research in this area, but having said that, I have to caution people that this gets into the "quick fix" area. This is the type of research that everyone likes to fund, from NIH on down. Millions of dollars have been put into this type of research over the past 30 years, and I would dare anyone to give me one example of where it has had any lasting impact on vector-borne disease transmission. These are very difficult manipulations to achieve, and even though you may be successful in the laboratory, when you put them into the field, it becomes more difficult to get that genetic change into the natural populations. I would strongly urge that there be more of a balance between funding for these kinds of projects and those to develop the basic programs in biology, behavior, prevention, and control that we know will actually work in preventing disease transmission.

I would like to focus more specifically on dengue and West Nile viruses. Beginning with dengue, please describe the current situation in the Americas.

It is depressing. We predicted, as early as 1980, that epidemic dengue would recur and become widespread in the American tropics and that dengue hemorrhagic fever would emerge in the region. Everything that we predicted has come true. Very few countries in the region, with the exception of Cuba, have taken seriously the challenge of developing prevention programs. Even Cuba has had some setbacks in recent years because of economic problems, but they are the only country in the region that effectively prevented and controlled epidemic dengue during the 1980s and most of the 1990s. In the past 30 years, the whole region has become reinfested by the principal urban vector, Ae. aegypti. Compared with the 1920s and 1930s, when there were major epidemics of both dengue and yellow fever in the region, the vector species now occurs in much higher densities in urban areas. There are more automobiles and therefore more tires; we have poor water systems, so people have to store water; and most consumer goods are packaged in nonbiodegradable plastics and tins. All of these make ideal larval habitats and breeding sites. Finally, the human populations are much larger in these urban areas, and the waste management systems in many cities are poor. The end result is a much denser human population living in intimate contact with much higher mosquito populations and, thus, much higher transmission potential for viral diseases like dengue. You add to that the increased movement of people between population centers around the world, who introduce new viruses on a regular basis, and the result is increased epidemic activity caused by all four dengue virus serotypes. This has created what I call hyperendemicity, or the co-circulation of multiple virus serotypes in communities, and that is generally associated with the emergency of dengue hemorrhagic fever. The situation in the Americas in 2001 is not good. We are going to see continued epidemics of dengue and continued dengue hemorrhagic fever, and we're going to see a lot of people dying of dengue hemorrhagic fever if we do not do something to

reverse the trend.

What is being done to control dengue virus?

Very little in the past 30 years. Since about 1970, the emphasis has been on spraying insecticides to control the adult mosquito population. Realizing that this approach does not work and that adulticides have little or no impact on disease transmission, we developed a community-based program in Puerto Rico in the 1980s that focused on larval control. We know that that approach works, because it was used to eradicate Ae. aegypti in the 1940s, 1950s, and 1960s from many countries of the region. The difference in 2001 is that we have large populations of people living in urban centers, and there is no way that any government in the region has the resources to go into every house every 7 days to control the larvae. If we're going to have sustainable larval control, we will need the help of the people who live in those houses. That is the rationale we used to develop the community-based program that has now become the basis for the global strategy of the World Health Organization. The Pan American Health Organization was among the first to embrace this approach. They developed guidelines for prevention and control of dengue hemorrhagic fever in 1994, held regional meetings with various governments, sent consultants to the countries to help them develop local programs, and followed up by sending review teams out to evaluate the progress. Unfortunately, with all of this work and support, most of the governments still do not have effective prevention and control programs in place. They still essentially wait until epidemics occur and then try to respond to them; the response is always too little and too late.

Has there been any demonstration of a decline of dengue virus due to control methods?

Probably the best example in this region is Cuba, which had a major epidemic of dengue hemorrhagic fever in 1981; they then implemented a mosquito control program. Initially, they used a lot of insecticides, but that really wasn't necessary. They developed a very effective larval control program that prevented epidemic dengue in Cuba for 16 years, from 1981 to 1997, using the people of the community and a lot of inspectors to follow up and evaluate. Essentially it was a top-down form of mosquito control, which requires central government control; this approach doesn't work in most democratic countries. But the take-home message is there: if you control the larval mosquitoes, you are going to control adult mosquitoes and prevent transmission; we know that it works. During this period, every country around Cuba had repeated, large epidemics of dengue. We have not effectively demonstrated that the community-based approach works in any other country. The closest to success would be in Puerto Rico, where in 1998 our surveillance system predicted an epidemic of dengue. The epidemic occurred as predicted, and a community- based response was implemented. It appeared that the epidemic was being controlled, when Hurricane Georges hit in the middle of all this. The hurricane terminated the surveillance program and probably also stopped transmission, so we don't have good data on the results of the program. The other country that has effectively controlled dengue using this approach is Singapore. Singapore put a program in place in 1968, and they went 20 years without any epidemics of dengue. In the mid-1980s, the director of the program retired, and they had a few years when it didn't function as well as it should have. Even so, they were able to keep the mosquito densities at a low level. The problem with Singapore is that it is surrounded by countries that repeatedly have major epidemics of dengue fever and dengue hemorrhagic fever, with hundreds of thousands of cases. Many immigrant workers go into Singapore on a daily basis, so they have a lot of introduced dengue, resulting in outbreaks during the 1990s.

What is the potential for dengue reaching epidemic levels in the United States?

Dengue is repeatedly introduced into this country every year. Millions of people travel from the United States to dengue-endemic countries in Latin America, Asia, the Pacific, and Africa, and they bring dengue back with them; in recent years, we have seen increased imported dengue. The mosquito vectors that transmit dengue occur in the United States, thus increasing the potential for epidemic transmission. Yet we have not had any major epidemics in this country for over 60 years. I think the reason for that is our lifestyle. We eliminated epidemic dengue and yellow fever in this country, but we did not eliminate the mosquitoes. Although there is reasonably good mosquito control—the mosquito abatement districts do a good job of controlling the mosquito populations—other factors probably played a more important role. These include reliable piped water systems, good waste management, and good housing with air conditioning and screening. We have relegated Ae. aegypti mosquitoes to outdoor peri-domestic habitats, where they do not have as much contact with humans. Human behavior in the United States is also not conducive to transmission. During the peak biting time, when Ae. aegypti feeds, humans are indoors, either eating breakfast in the morning or watching television in the late afternoons and evenings. My feeling is that while we are at risk and there is the potential for an epidemic, I don't think we are going to see any major epidemics of dengue in this country, as long as we maintain our public health infrastructure and our standard of living.

What are the similarities and differences between dengue and West Nile viruses?

They are similar in the sense that they are both flaviviruses, and they both cause a similar type of illness—a nonspecific viral syndrome— in the majority of infected patients. But there are a lot more differences between these viruses than there are similarities. West Nile is generally a rural disease, whereas dengue is an urban disease. West Nile is maintained in a Culex mosquito–bird cycle, and dengue is maintained in an Aedes–human cycle. There is no good evidence yet, although we don't discount it, that humans play a role in the transmission cycle of West Nile virus; whether the viremia is high enough for a human to infect mosquito vectors has not been determined. While West Nile is primarily a rural virus, recent epidemics have occurred in urban areas (Bucharest, New York City, Volgograd, and Tel Aviv), so it is adaptable to urban areas. Whether it will persist in urban areas is another question. Our guess is that it will ultimately become enzootic in the United States, primarily in rural areas.

What is the threat of West Nile—the worst-case and best-case scenarios?

Of course, the worst-case scenario would be that it has become established in the United States and will move with the migratory bird population south into the southern coastal states, as well as into the Caribbean and Latin America, and then with spring migrations will be reintroduced back into the United States, into the Midwest and western regions, and ultimately become widespread in the United States. The best-case scenario is that it will act like St. Louis encephalitis virus, which is closely related and has appeared in the northern latitudes. St. Louis encephalitis virus has occurred as far north as Canada, but generally, after outbreaks, the virus persists for a year or two and then disappears. These viruses, St. Louis encephalitis and West Nile, are basically tropical viruses, and their natural cycles are in tropical or subtropical regions. We won't know what the outcome will be until we have several years of surveillance data behind us.

What is most responsible for new mosquito vectors coming into the United States?

The most likely way these exotic mosquito species are brought into the country is in commodities, through container shipping. We are quite sure that Ae. albopictus and probably Oc. japonicus were introduced by this mechanism, probably in the used automobile or truck tire trade. These mosquitoes love to lay their eggs in used tires. When used tires arrive in the United States, they are often stored in an uncovered area; when it rains, the eggs are flooded, they hatch, and the larvae develop to pupae and adults. I don't know of a single case in which an exotic mosquito species has been established by the introduction of an adult, but I suppose it is possible.

of an adult, but I suppose it is possible.

What are the prospects and strategies for preventing further introductions of mosquitoes?

There are several possibilities. We tried to prevent the introduction of new species after Ae. albopictus was introduced in the 1980s by implementing strict quarantine regulations that required the people who brought in used tires to inspect and fumigate them to kill the eggs. Because there is such a huge trade and so many containers had to be checked, it became unreasonable to enforce that regulation, and it was taken off the books. I think the best way to prevent the establishment of exotic species in the United States is to rebuild the infrastructure in this country at the local level to deal with both pest and vector mosquito species. Any time a new species is introduced, effective surveillance by trained people will detect it immediately, and targeted control can be initiated to eliminate it. That is probably the most cost-effective way of preventing future introductions. It has the side benefit of having professional entomologists who are doing the mosquito surveillance and can implement controls to prevent disease. It also controls pest mosquitos and improves the quality of life for the people in the community.

What specifically is being done to control West Nile virus?

After the 1999 epidemic, we developed guidelines for the surveillance, prevention, and control of West Nile virus in the United States. We implemented those guidelines in the spring of 2000 with supplemental funding from Congress. Unfortunately, it was not enough money to initiate mosquito control, but it was enough to implement surveillance to monitor what was happening. We didn't even know if West Nile would survive throughout the winter. This winter, we will review the surveillance data from the 2000 transmission season, make further recommendations on the prevention and control of this disease, and help state and local health departments initiate their programs. If we are ever going to prevent human infection with West Nile virus, we have to get on with the business of developing locally based mosquito abatement programs. We need to focus on larval control and not wait until we have activity in an area and then depend on adulticides. There has to be a change in the mentality of the public health officials who are making decisions about vector-based disease control. We have a good model of mosquito abatement districts, especially along the Gulf Coast from Texas to Florida. They are highly professional, are funded through local mill levy tax systems, and are quite effective at doing mosquito surveillance and control.

Is it fair to say that at present there is insufficient trained manpower in the United States to address a threat such as West Nile?

Yes, it is safe to say that. To put this into a historical perspective, you must look back at the types of programs that were in place at the local and state levels and in our universities 30 years ago. In 1970, there were many local mosquito control programs in place, routinely doing mosquito surveillance and control, and there were numerous university-based arbovirus programs that provided the necessary technical expertise and diagnostic support for arboviruses. In 2001, however, you will find that not many states have mosquito surveillance and control programs in place and that either most of the arbovirus programs in the universities have deteriorated to the point where they are small, ineffective programs, or they have been completely eliminated. The first thing we need is for the public and public health officials to realize that if we are going to prevent epidemics of exotic diseases like West Nile, we need to rebuild the infrastructure to deal with mosquito-borne diseases. We are very ill prepared to deal with these kinds of introductions at the beginning of the 21st century.

Walter Douglas Gubler

Santa Clara - Walter Douglas Gubler, Ph.D. Emeritus, 72, passed away July 19, 2018.

He was born January 28, 1946, in St. George, Utah, to June Gubler and Thelma Whipple Gubler of Santa Clara.

He was raised in Santa Clara UT, and he graduated from Dixie High School in 1964.

Doug earned a Bachelor's of Science degree in Botany from Southern Utah University, a Master's of Science in Plant Pathology from the University of Arkansas at Fayetteville, and a PhD in Plant Pathology from the University of California, Davis

Doug worked one year as a research scientist with Campbell Soup Company, and then moved to U.C. Davis as an extension plant pathologist.

Called an "academic legend" by his colleagues, he was a co-author on over 120 refereed journal publications, 165 book chapters, 1 authored book, 6 books edited, and 168 abstracts.

His research in powdery mildew and Botrytis bunch rot were game-changers for the grape industry.

He also completed valuable research for the tree fruit, strawberry, and melon industries.

He gave over 40 talks a year and consulted in over 63 countries.

He was recognized globally as a leading expert in his field and received accolades from many groups, organizations, and associations for his contributions.

Doug mentored many graduate students, post-docs, and researchers during his career, and his legacy will live on through their continued efforts.

Doug married his high school sweetheart, Carol Leavitt Gubler, in August 1964, and they had five children.

While Doug loved his career, nothing came close to how much he loved and cherished his family.

He was proud of each of their achievements, and he was quick to let them know.

He generously shared his love and his sense of humor with his family, which made for many happy family gatherings.

Doug enjoyed teaching and learning, golfing, listening to talk radio, researching, telling jokes, playing cards and games with his grandchildren, and spending quality time with his friends and family.

Doug was an active member of The Church of Jesus Christ of Latter-day Saints, and served in various callings, including Bishop.

He loved the Lord and the blessings of serving in the church, and he regularly blessed the lives of others through his generosity and service.

He was a humble and kind religious leader, and beloved by all those he served and worked with in that capacity.

Once, when asked about the sacrifice of serving, he said, "Despite the demands, it is such an honor to serve in a capacity where I can hopefully be an instrument for good, in helping to serve God and my fellow men."

He is survived by his wife, Carol; son, Curtis; daughters: Kirsten Stevens (Lance), Sherie Linford (Fred), Andrea Carter (Brent), Natalie Jeffs (Randy); and grandchildren: J.D., Kaylee, Morgan, Chelsea, Ryan, Blake, Brandon, Lauren, Garrett, Ashley, Tyler, Julia, Andrew, Whitney, Spencer, Dax, Lexi, Brynn, and Grant.

His surviving siblings include: Ward Gubler (Judy), Pat Clove (Sheldon), Duane Gubler (Bobbie), Muriel Blake, Murray Gubler (Jane), and Jeff Gubler (Angela).

He was preceded in death by his parents, June and Thelma Gubler and his sister, Doris Daugherty.

Funeral services will be held Monday, July 30, 2018 at 11:00 a.m. at the Santa Clara LDS 14th Ward Chapel, 630 Riesling Avenue, Santa Clara, Utah.

Visitations will be held Sunday evening from 6:00 p.m. to 8:00 p.m. at Metcalf Mortuary, 288 West St. George Blvd. and on Monday, prior to services, from 9:30 a.m. to 10:30 a.m. at the church.

Interment will be in the Santa Clara City Cemetery.

Gulf War syndrome

Wikipedia Gulf War syndrome

Here are a few links to webpages that yet exist on the subject. [...]

This first link discusses the use of an adjutant that caused autoimmune disease , found in 95% of those military personnel that were given the vaccine. If one gives multiple vacciens at the same time, each with its adjutant, then overwhelming the immune system can occur, with infants being given multiple vaccines at the same time.

1999-04-10-newscientist-com-victims-of-vaccines.pdf

Victims of vaccines

10 April 1999

By Debora Mackenzie

A FATTY substance originally isolated from sharks could explain Gulf War syndrome. Blood tests on sick veterans in the US show that nearly all produce antibodies to squalene, a component of some experimental vaccines. Congress's General Accounting Office (GAO), which was asked to investigate, can't say for sure whether squalene was used on Gulf War troops. But it is now demanding further tests for squalene antibodies in military personnel. The Department of Defense is opposed to this.

Around 100 000 troops who served in the 1991 Gulf conflict with Iraq developed a mysterious illness involving memory loss, thyroid disorders, allergies, fatigue, rashes and persistent pain. Military authorities and sufferers have long argued over the cause of the symptoms and whether a distinct syndrome even exists.

Bob Garry, a virologist at Tulane University in New Orleans, has now tested 400 Gulf War veterans for antibodies to squalene, a polymer of fatty acids found in small quantities in human cell membranes. Ninety-five per cent of the veterans suffering from Gulf War syndrome (GWS) had high levels of squalene antibodies. People don't usually have enough squalene in their blood to prompt the production of detectable levels of antibodies, and none of the veterans without symptoms had antibodies. Garry's results have been peer reviewed, he says, and await publication.

Squalene can be released into the blood by physical injuries, where it boosts

the immune system's response to foreign antigens. This "adjuvant" effect means it is widely used in animal vaccines. Squalene is not licensed for use as an adjuvant in people, although it has been used experimentally on about 12 000 people.

Garry also tested two volunteers who had received experimental herpes vaccines containing squalene in trials run by the US National Institutes of Health. Both have high levels of squalene antibodies and symptoms similar to GWS. This suggests that GWS could be caused by the body turning against its own, natural squalene.

Jim Turner, a spokesman for the Department of Defense, says: "During the Gulf War, we never used squalene in vaccines." But many soldiers' vaccination records have been lost, which makes this difficult to verify. Jack Metcalf, a Republican member of Congress from Washington state, who asked the GAO to investigate, says: "In light of the number of misstatements DoD made to the GAO during this investigation, we cannot be expected to simply accept their denial of squalene use."

Vaccines have often come under suspicion as a cause of GWS. Gulf War soldiers were the first to be systematically vaccinated against anthrax and plague because Iraq was thought to have biological weapons. France was the only country not to vaccinate its troops, and only French veterans are free of GWS. In January, researchers at King's College Hospital in London reported that exposure to plague and anthrax vaccines was the factor that correlated most strongly with GWS in British veterans. GWS activists claim that some British soldiers received American vaccines.

GWS has also been blamed on exposure to chemicals in Iraq. But Garry found squalene antibodies in six soldiers who were vaccinated but never went to the Gulf.

The Gulf War Veterans Association, based in Versailles, Missouri, suspects that most cases of GWS were caused by experimental vaccines. If so, says the association's Dave vonKleist, this would violate the Nuremberg Convention. "Military personnel are not subjects for experimentation," he says.

THE GULF BIO WAR: HOW A NEW AIDS-LIKE PLAGUE THREATENS OUR ARMED FORCES

- May 1, 2016
- 0

by Alan R. Cantwell, Jr., M.D.

What is the common thread which weaves through the occurrence of the highly contagious disease known as the Gulf War Syndrome, which has struck as many as 60,000 veterans? Dr. Cantwell has found a biowarfare connection. Since the Nuremberg trials, it has been against international law to use people as guinea pigs in experiments without their informed consent. In an unprecedented legal decision, the FDA allowed the Pentagon to give un-approved drugs and vaccines to soldiers without their consent. The Pentagon also refused to identify the types of drugs and injections the troops were given forcibly, rendering them powerless against genetically altered "supergerms."

As many as 60,000 of the 700,000 Gulf War vets who served in Desert Storm in 1991 are ill with a variety of symptoms lumped together as Persian Gulf War Syndrome (GWS). Symptoms include chronic fatigue, severe neurological disorders, muscle and joint pain, shortness of breath, gastrointestinal problems, memory loss, insomnia, rashes, depression, headaches, and other complaints. GWS is a sexually transmitted disease, and is contagious via the airborne route. Soldiers are passing the illness on to wives and family members; and their children appear to have an increased incidence of birth defects.

The government and the Pentagon stand accused of ignoring the vets by denying they were exposed to chemical or biological agents in the Gulf. Originally many vets were told by military doctors that their symptoms were caused by stress. The large number of sick vets led to an official inquiry.

In August 1995, a massive government study of GWS indicated no evidence of so-called Gulf War disease. Dr. Stephen Joseph, assistant secretary of defense for health affairs, claimed the soldiers were suffering from "multiple" diseases not stemming from any one cause, and that their collective health was no worse than their counterparts in civilian life. The report denied that vets were exposed to chemical agents in the Gulf.

Reynaldo Negrete, in a letter of protest to the Los Angeles Times (8/20/95), wrote:

When my son Ruben, a career Navy Seebee of 14 years, was sent to the Gulf he was a healthy young man weighing 185 pounds. When he came back four months later he had lost 20 pounds and his health. He continued to lose weight for more than a year, but the doctors at Port Hueneme and his command did nothing. Not until I had my congressman, Matthew G. Martinez, intervene on his behalf was our son admitted to the Naval Hospital in San Diego a year after arriving from the Gulf War a very sick young man. He then spent a year in the hospital, until he was medically discharged from the Navy no better off than the day he was admitted. Yet, my son continues to suffer, as does his family. My son has served his country very well, for more than 14 years. He has been deployed all over the world, and in just four short months in the Persian Gulf he comes home an invalid."

A year later, in 1996, the Department of Defense finally admitted that 400 soldiers (later changed to 5,000; still later to 20,000) may have been exposed to toxic agents when, after the war had officially ended, the military blew up an ammunition storage depot in Kamisiyah in southern Iraq on March 4 and again on March 10, 1991. After the bombings, a U.N. inspection team informed Pentagon officials that the buildings contained chemical weapons. However, the Pentagon immediately classified the U.N. report and the troops were never alerted about possible exposure to toxic chemicals.

Despite the cover-up, exposure to chemicals cannot account for so many sick soldiers. Not all sick vets were stationed in the Kamisiyah area. Many left the Iraqi war zone before the war actually started, or arrived after the fighting stopped. In addition, exposure to chemicals cannot explain why some cases of GWS are contagious.

The first media reports of a Gulf illness surfaced in the spring of 1992, a year after the war ended. As time passed, the transmissibility of the disease was downplayed, as well as the fact that wives complained about miscarriages and "burning semen" after sex with their husbands. Veteran's groups now claim that a third of Gulf War babies are born with birth abnormalities. LIFE magazine (November 1996) featured a story on these Gulf babies entitled "The tiny victims of Desert Storm: Has our country abandoned them?" Pictured on the cover was U.S. Army Sgt. Paul Hansen holding his three-year-old son, born with hands and feet attached to twisted stumps.

In the search for a cause of GWS, epidemiologists have been looking for a common factor that could have exposed so many Gulf War vets. Some sick vets were in the war zone for months, while others were stationed there for as little as nine days. And the illness has affected troops stationed in widely scattered geographic areas in the region.

One factor common to all the troops is that they were given experimental and potentially dangerous drugs and vaccines employed to protect them against Iraqi chemical and biowarfare agents. As early as December 1990, there were warnings about using our servicemen as medical guinea pigs. In an unprecedented legal decision, the FDA allowed the Pentagon to give unapproved drugs and vaccines without requiring consent of the soldiers. Claiming security reasons, the Pentagon also refused to identify the types or the number of drugs and injections they forced the troops to take.

An angry serviceman stationed in Saudi Arabia maintained his civil rights were violated, and sued the government in January 1991. Ever since the post World War II Nuremberg trials, which convicted many top-ranking Nazis for crimes against human nature, it has been unethical and unlawful to use people as guinea pigs in experiments without their informed consent. This legal requirement was waived when the lawsuit was dismissed by U.S. District Judge Stanley S. Harris, who cited the necessity of the military to protect the health of its troops.

Soldiers who rejected the injections were given them forcibly. Physicians who refused to cooperate with the military's experimental vaccine program were treated harshly. Army reservist Dr. Yolanda Huet-Vaughn protested it was her duty under the Nuremberg Code of Justice not to vaccinate personnel with experimental vaccines without their consent. At Huet-Vaughn's court-martial trial, a military judge ignored these considerations of international law and medical ethics, and sentenced the mother of three children to 30 months in prison. Under pressure from activist groups, the doctor was released from military prison after serving eight months.

Allegations that experimental drugs and vaccines are a cause of GWS have been downplayed for obvious reasons. The Pentagon does not want to publicize the idea that PGS could be a man-made disease due to unethical experiments with dangerous and possibly contaminated vaccines. Furthermore, the military has a long history of conducting covert medical experiments on its own personnel, as well as civilians; and the Agent Orange cover-up is still fresh in the minds of Vietnam war vets.

GWS is not limited to American soldiers. More than 1,100 British vets are ill. Many blame the injections they received against anthrax and plague. Englishman Tony Flint, associated with the Gulf War Veterans and Families Association, claims more than 100 vets have died of ailments ascribed to the inoculations. He says he was forced to take 13 inoculations in one week, and states there is no evidence of GWS among French troops who did not receive these vaccines.

The HIV Connection

Garth Nicholson and his wife Nancy, both respected microbiologists, have recently discovered a bacterium, a so-called "mycoplasma" in the blood of half the vets ill with GWS. The microbe associated with GWS has been identified as Mycoplasma fermentans (incognitus strain). Discovered a century ago in plants, mycoplasmas are the smallest known self-replicating microbes. Larger than viruses and much smaller than common bacteria, mycoplasmas have been implicated in a variety of diseases.

The mycoplasma in GWS could not be identified using standard lab tests. Through special genetic testing Garth Nicolson was able to discover the mycoplasma. Incredibly, the microbe had a piece of the envelope gene of the AIDS virus (HIV-1) attached to it! The HIV gene makes the mycoplasma even more aggressive, allowing it to attach to cells, which it then penetrates and poisons. According to Nicolson, a mycoplasma combined with the envelope gene of the AIDS retrovirus could never have originated in nature, but only through gene splicing in a laboratory.

Both Nicolsons contracted GWD from their daughter when she returned home from Desert Storm. Because of the contagious nature of the disease, the microbiologists suspected an infectious agent, rather than a chemical weapon. When the mycoplasma was identified, the research team discovered that treatment with antibiotics, particularly doxicycline, was helpful in some cases.

In an interview on the Dave Emory radio show (10/20/96), Garth Nicolson theorizes that the microbe could have been deployed through contaminated vaccines, through the deliberate release of Iraqi bioweapons, from blowback from destroyed Iraqi bioweapon factories, or possibly from scud missile attacks. He says there has been a Mycoplasma Unit at the University of Baghdad for 22 years, manned by Iraqi scientists who were trained in the U.S. Before the war, the U.S. government exported to Iraq various biological agents, both classified and unclassified, that could be used or developed as biological warfare agents.

Did this mycoplasma + HIV bioweapon originate in the U.S. or in the Gulf? It would be extremely helpful to know if there are cases of GWS in Iraq, Kuwait, Saudi Arabia, Jordan, and elsewhere in the Middle East. Surprisingly, the government and the media are silent on this question, although Nicolson claims 300,000 Iraqis have died and one million are sick since the war. It is rumored that 15-20% of the population of the countries surrounding Iraq are ill with GWS.

In a 40-page report entitled "Germ Warfare against America: The Desert Storm Plague and Cover-Up, Nicolson reports:

Mycoplasma fermentans (incognitus) has been tested on the Texas Department of Corrections prisoners in the late 1980s prior to the Gulf War. It was tested on death row inmates as well as other inmates in Huntsville, Texas. The guards then contracted it from the inmates, and the guards then gave it to their families and community. This mycoplasma vaccine testing was funded by the U.S. Army, and today there is an outbreak of 350 people in the Huntsville area with a strange disease resembling GWS.

Garth Nicolson's important research has appeared in the underground press, but until recently his research has been ignored by the mainstream, corporate-controlled media. On the Emory show Nicolson was asked how many soldiers have died of GWS. Although there are no official figures, he estimates that 12-15,000 vets have died of "unusual" diseases, and several thousand have died of cancer. If true, these death rates are very high considering the young age (under 25) of many of our soldiers. Apparently doctors, nurses, and medical personnel are contracting GWS from sick patients, indicating another AIDS-like epidemic in the making.

Further complicating the epidemiology of GWS is that soldiers' shot records and even medical records have disappeared or are unavailable. In addition, the Los Angeles Times (12/5/96) reports that military logs "crucial to Gulf War veterans who believe their health problems are linked to chemical weapons" are also missing and can't be found. These important logs cover the period March 4-10, during the bombings at Kamisiyah. The Senate Veterans Affairs Committee has recently won permission to examine General Norman Schwartzkopf's personal logs.

At the request of Rep. Norm Dicks of Washington state, a group of military and civilian scientists and Pentagon experts met on December 23, 1996, at Walter Reed Army Hospital in Washington, to discuss Nicolson's research. Walter Reed spokesman Ben Smith said the Army would agree to study his mycoplasma research as part of its investigation into the cause of GWS.

On December 27, 1996, a story about Garth Nicolson's research appeared on the front-page of the Los Angeles Times. However, the most significant part of Nicholson's research, namely that the mycoplasma had a piece of HIV attached to it, was not mentioned. The origin of the microbe was left in doubt, the writer simply stating that Nicolson's research suggests "the primitive bacterium, called mycoplasma, was deliberately altered for Iraqi use as a biological weapon."

Also not mentioned in the media was previous mycoplasma research conducted by the military a decade earlier. In 1986 Dr. Shyh-Ching Lo, a molecular biologist at the Armed Forces Institute of Pathology in Washington, D.C., reported a "virus-like agent" derived from Kaposi's sarcoma, the "gay cancer" associated with AIDS. Using highly technical methods of molecular biology, Lo's "virus" was subsequently identified as the bacterium Mycoplasma fermentans (also known as M. incognitus). In 1989, Lo also reported similar mycoplasma infection as the cause of death in six young, previously healthy military personnel from New Jersey, Virginia, Guam, and Turkey, all of whom died within one to seven weeks from a progressive and mysterious "flu-like disease." In 1991 Lo found yet another mycoplasma, Mycoplasma penetrans, in the urine of gays with AIDS. Luc Montagnier, the co-discoverer of the AIDS virus, has confirmed Lo's mycoplasma research. The Pasteur Institute virologist believes mycoplasmas are a necessary "co-factor" that allows HIV infection to progress to full-blown AIDS.

Are mycoplasmas being developed as biological warfare weapons? Certainly all known infectious agents are screened for possible military use by biowarfare scientists around the world. As stated, there was a Mycoplasma lab in Iraq. Before the Gulf War the Iraqis freely used nerve gas against the Kurds in Northern Iraq; and after the war they used mustard gas against Shiite Muslim nomads in southern Iraq. And the U.S. Army conducted mycoplasma research

in Huntsville, Texas.

Before the Gulf War the mixing of the AIDS virus (HIV) with mycoplasmas in the laboratory by Lo and Montagnier was recorded in the scientific literature. When mycoplasma was added to HIV-infected blood cells in test tubes, it made the AIDS virus more pathogenic. Silver-leaf monkeys experimentally infected with Lo's mycoplasma all developed infections, immunosuppression, and died within 7 to 9 months with an AIDS-like "wasting syndrome."

A "Mycoplasma Workshop," sponsored by The National Institutes of Allergy and Infectious Diseases, was held in San Antonio, Texas, in December 1989. Lo's research was featured. When asked if his fatal mycoplasma "flu cases" were contagious, Lo replied, "We don't know." Interestingly, some of Lo's patients improved with the antibiotic doxycycline, the same drug Nicolson has found effective in some cases of GWS.

Most physicians know little about mycoplasma infection, and even less about testing for these microbes. For many years this writer has reported mycoplasma-like organisms discovered in the damaged tissue of cancer, AIDS, and in auto-immune disease. This research has been published in medical journals and summarized in two books by this author: AIDS: The Mystery and the Solution (1984) and The Cancer Microbe (1990). Unfortunately, this research has been largely ignored by the AIDS and cancer establishments, as well as by so-called mycoplasma experts. These bacteria can be easily seen microscopically in the diseased tissue of AIDS (including Kaposi's sarcoma), cancer, and certain other diseases of unknown cause.

As some people in medical science are aware, important and valid scientific discoveries are ignored because they are "politically incorrect." Lo's mycoplasma research has been largely ignored by the leading virologists who direct AIDS research. Similarly, Lo has ignored the published research of hundreds of other researchers who have shown mycoplasma-like microbes in cancer, AIDS, and immune diseases. The inability of scientists to consider "politically incorrect" scientific findings may explain why physicians currently have such difficulty understanding and treating new epidemics like AIDS and GWS, in which these microbes are operative.

Why does the military ignore GWS and deny its existence? Undoubtedly, chemical and biological weapons were employed in the Gulf War. Was the military fully capable of detecting these bioweapons? Or was the detection of chemical agents and bioweapons ignored or covered up? Is the military capable of protecting its troops from modern day biowarfare? Are soldiers now powerless against genetically engineered "supergerms" deployed by biowarfare scientists?

In the future, will soldiers willingly go into battle knowing that exposure to bioweapons will be ignored by their government, and knowing that no one is immune from the effects of these man-made microbes of death?•

Persian Gulf War Illness

Other names

Persian Gulf War illnesses, and chronic multisymptom illness[1][2]

Summary of the Operation Desert Storm offensive ground campaign, February 24–28, 1991, by nationality

Symptoms

Vary somewhat among individuals and include fatigue, headaches, cognitive dysfunction, musculoskeletal pain, insomnia,[3] and respiratory, gastrointestinal, and dermatologic complaints

Causes

Toxic exposures during the 1990–91 Gulf War

Differential diagnosis

Chronic fatigue syndrome / myalgic encephalitis (CFS/ME); fibromyalgia; multiple sclerosis (MS)

Frequency

25% to 34% of the 697,000 U.S. troops of the 1990–91 Gulf War

Gulf War syndrome or **Gulf War illness** is a chronic and multi-symptomatic disorder affecting returning military veterans of the 1990–1991 Persian Gulf War.[4][5][6] A wide range of acute and chronic symptoms have been linked to it, including fatigue, muscle pain, cognitive problems, insomnia,[3] rashes and diarrhea.[7] Approximately 250,000[8] of the 697,000 U.S. veterans who served in the 1991 Gulf War are afflicted with enduring chronic multi-symptom illness, a condition with serious consequences.[9]

From 1995 to 2005, the health of combat veterans worsened in comparison with nondeployed veterans, with the onset of more new chronic diseases, functional impairment, repeated clinic visits and hospitalizations, chronic fatigue syndrome-like illness, posttraumatic stress disorder, and greater persistence of adverse health incidents.[10]

Exposure to pesticides and pills containing pyridostigmine bromide (used as a pretreatment to protect against nerve agent effects) has been found to be associated with the neurological effects seen in Gulf war syndrome.[11][12] Other causes that have been investigated are sarin, cyclosarin, and emissions from oil well fires, but their relationship to the illness is not as clear.[11][12]

Studies have consistently indicated that Gulf War syndrome is not the result of combat or other stressors and that Gulf War veterans have lower rates of posttraumatic stress disorder (PTSD) than veterans of other wars.[9][11]

According to a 2013 report by the Iraq and Afghanistan Veterans of America, veterans of the U.S. wars in Iraq and Afghanistan may also suffer from Gulf War syndrome,[13] though later findings identified causes that would not have been present in those wars.[11][12]

[...]

Signs and symptoms[edit]

According to an April 2010 U.S. Department of Veterans Affairs (VA) sponsored study conducted by the Institute of Medicine (IOM), part of the U.S. National Academy of Sciences, 250,000[8] of the 696,842 U.S. servicemen and women in the 1991 Gulf War continue to suffer from chronic multi-symptom illness, which the IOM now refers to as *Gulf War illness*. The IOM found that it continued to affect these veterans nearly 20 years after the war.[*citation needed*]

According to the IOM, "It is clear that a significant portion of the soldiers deployed to the Gulf War have experienced troubling constellations of symptoms that are difficult to categorize," said committee chair Stephen L. Hauser, professor and chair, department of neurology, University of California, San Francisco (UCSF). "Unfortunately, symptoms that cannot be easily quantified are sometimes incorrectly dismissed as insignificant and receive inadequate attention and funding by the medical and scientific establishment. Veterans who continue to suffer from these symptoms deserve the very best that modern science and medicine can offer to speed the development of effective treatments, cures, and—we hope—prevention. Our report suggests a path forward to accomplish this goal, and we believe that through a concerted national effort and rigorous scientific input, answers can be found."[8]

Questions still exist regarding why certain veterans showed, and still show, medically unexplained symptoms while others did not, why symptoms are diverse in some and specific in others, and why combat exposure is not consistently linked to having or not having symptoms. The lack of data on veterans' pre-deployment and immediate post-deployment health status and lack of measurement and monitoring of the various substances to which veterans may have been exposed make it difficult — and in many cases impossible — to reconstruct what happened to service members during their deployments nearly 20 years after the fact, the committee noted.[8] The report called for a substantial commitment to improving identification and treatment of multisymptom illness in Gulf War veterans focussing on continued monitoring of Gulf War veterans, improved medical care, examination of genetic differences between symptomatic and asymptomatic groups and studies of environment-gene interactions.[8]

Birth defects have been suggested as a consequence of Gulf War deployment. However, a 2006 review of several studies of international coalition veterans' children found no strong or consistent evidence of an increase in birth defects, finding a modest increase in birth defects that was within the range of the general population, in addition to being unable to exclude recall bias as an explanation for the results.[15] A 2008 report stated that "it is difficult to draw firm conclusions related to birth defects and pregnancy outcomes in Gulf War veterans", observing that while there have been "significant, but modest, excess rates of birth defects in children of Gulf War veterans", the "overall rates are still within the normal range found in the general population".[16] The same report called for more research on the issue.

Comorbid illnesses[edit]

Gulf War veterans have been identified to have an increased risk of multiple sclerosis.[17]

A 2017 study by the U.S. Department of Veterans Affairs found that veterans possibly exposed to chemical warfare agents at Khamisiyah experienced different patterns of brain cancer mortality risk compared to the other groups, with veterans possibly exposed having a higher risk of brain cancer in the time period immediately following the Gulf War.[18]

Causes[edit]

The United States Congress mandated the U.S. Department of Veterans Affairs' contract with the National Academy of Sciences (NAS) to provide reports on Gulf War illnesses. Since 1998, the NAS's Institute of Medicine (IOM) has authored ten such reports.[19] In addition to the many physical and psychological issues involved in any war zone deployment, Gulf War veterans were exposed to a unique mix of hazards not previously experienced during wartime. These included pyridostigmine bromide pills (given to protect troops from the effects of nerve agents), depleted uranium munitions, and multiple simultaneous vaccinations including anthrax and botulinum toxin vaccines. The oil and smoke that spewed for months from hundreds of burning oil wells presented another exposure hazard not previously encountered in a war zone. Military personnel also had to cope with swarms of insects, requiring the widespread use of pesticides. High-powered microwaves were used to disrupt Iraqi communications, and though it is unknown whether this might have contributed to the syndrome, research has suggested that safety limits for electromagnetic radiation are too lenient.[20]

The Research Advisory Committee on Gulf War Veterans' Illnesses (RAC), a VA federal advisory committee mandated by Congress in legislation enacted in

The Research Advisory Committee on Gulf War Veterans' Illnesses (RAC), a VA federal advisory committee mandated by Congress in legislation enacted in 1998,[21][22] found that pre-2005 studies suggested the veterans' illnesses are neurological and apparently are linked to exposure to neurotoxins, such as the nerve gas sarin, the anti-nerve gas drug pyridostigmine bromide, and pesticides that affect the nervous system. The RAC concluded in 2004 that, "research studies conducted since the war have consistently indicated that psychiatric illness, combat experience or other deployment-related stressors do not explain Gulf War veterans illnesses in the large majority of ill veterans."[23]

The RAC concluded[11] that "exposure to pesticides and/or to PB [pyridostigmine bromide nerve agent protective pills] are causally associated with GWI and the neurological dysfunction in GW veterans. Exposure to sarin and cyclosarin and to oil well fire emissions are also associated with neurologically based health effects, though their contribution to development of the disorder known as GWI is less clear. Gene-environment interactions are likely to have contributed to development of GWI in deployed veterans. The health consequences of chemical exposures in the GW and other conflicts have been called “toxic wounds” by veterans. This type of injury requires further study and concentrated treatment research efforts that may also benefit other occupational groups with similar exposure-related illnesses."[12]

Earlier considered potential causes[edit]

Depleted uranium[edit]

Major Gulf War engagements in which DU rounds were used

Depleted uranium (DU) was widely used in tank kinetic energy penetrator and autocannon rounds for the first time ever during the Gulf War[24] and has been suggested as a possible cause of Gulf War syndrome.[25] A 2008 review by the U.S. Department of Veterans Affairs found no association between DU exposure and multisymptom illness, concluding that "exposure to DU munitions is not likely a primary cause of Gulf War illness". However, there are suggestions that long-term exposure to high doses of DU may cause other health problems unrelated to GWI.[9]

More recent medical literature reviews disagree, stating for example that, "the number of Gulf War veterans who developed the Gulf War syndrome following exposure to high quantities of DU has risen to about one-third of the 800,000 U.S. forces deployed," with 25,000 of those having suffered premature death.[26] Since 2011, US combat veterans may claim disability compensation for health problems related to exposure to depleted uranium.[27] The Veterans Administration decides these claims on a case-by-case basis.

A team at the University of Portsmouth lead by Professor Randall Parrish tested urine samples of 154 US veterans in 2021, reporting that no soldiers with the syndrome were exposed to significant amounts of depleted uranium and that it "is not and never was in the bodies of those who are ill at sufficient quantities to cause disease".[28][29]

Pyridostigmine bromide nerve gas antidote[edit]

The US military issued pyridostigmine bromide (PB) pills to protect against exposure to nerve gas agents such as sarin and soman. PB was used as a prophylactic against nerve agents; it is not a vaccine. Taken before exposure to nerve agents, PB was thought to increase the efficiency of nerve agent antidotes. PB had been used since 1955 for patients suffering from myasthenia gravis with doses up to 1,500 mg a day, far in excess of the 90 mg given to soldiers, and was considered safe by the FDA at either level for indefinite use and its use to pre-treat nerve agent exposure had recently been approved.[30]

Given both the large body of epidemiological data on myasthenia gravis patients and follow-up studies done on veterans it was concluded that while it was unlikely that health effects reported today by Gulf War veterans are the result of exposure solely to PB, use of PB was causally associated with illness.[9] However, a later review by the Institute of Medicine concluded that the evidence was not strong enough to establish a causal relationship.[31]

Organophosphates[edit]

Organophosphate-induced delayed neuropathy (OPIDN, aka organophosphate-induced delayed polyneuropathy) may contribute to the unexplained illnesses of the Gulf War veterans.[32][33]

Organophosphate pesticides[edit]

The use of organophosphate pesticides and insect repellents during the first Gulf War is credited with keeping rates of pest-borne diseases low. Pesticide use is one of only two exposures consistently identified by Gulf War epidemiologic studies to be significantly associated with Gulf War illness.[34] Multisymptom illness profiles similar to Gulf War illness have been associated with low-level pesticide exposures in other human populations. In addition, Gulf War studies have identified dose-response effects, indicating that greater pesticide use is more strongly associated with Gulf War illness than more limited use.[35] Pesticide use during the Gulf War has also been associated with neurocognitive deficits and neuroendocrine alterations in Gulf War veterans in clinical studies conducted following the end of the war. The 2008 report concluded that "all available sources of evidence combine to support a consistent and compelling case that pesticide use during the Gulf War is causally associated with Gulf War illness."[9]

Sarin nerve agent[edit]

See also: Iraqi chemical weapons program

Many of the symptoms of Gulf War illness are similar to the symptoms of organophosphate, mustard gas, and nerve gas poisoning.[36][37] Gulf War veterans were exposed to a number of sources of these compounds, including nerve gas and pesticides.[38]

Chemical detection units from Czechoslovakia, France, and Britain confirmed chemical agents. French detection units detected chemical agents. Both Czech and French forces reported detections immediately to U.S. forces. U.S. forces detected, confirmed, and reported chemical agents; and U.S. soldiers were awarded medals for detecting chemical agents. The Riegle Report said that chemical alarms went off 18,000 times during the Gulf War. After the air war started on January 16, 1991, coalition forces were chronically exposed to low but nonlethal levels of chemical and biological agents released primarily by direct Iraqi attack via missiles, rockets, artillery, or aircraft munitions and by fallout from allied bombings of Iraqi chemical warfare munitions facilities.[39]

In 1997, the US Government released an unclassified report that stated:

> "The US Intelligence Community (IC) has assessed that Iraq did not use chemical weapons during the Gulf war. However, based on a comprehensive review of intelligence information and relevant information made available by the United Nations Special Commission (UNSCOM), we conclude that chemical warfare (CW) agent was released as a result of US postwar demolition of rockets with chemical warheads in a bunker (called Bunker 73 by Iraq) and a pit in an area known as Khamisiyah."[40]

Over 125,000 U.S. troops and 9,000 U.K. troops were exposed to nerve gas and mustard gas when the Iraqi depot in Khamisiyah was destroyed.[*citation needed*]

Recent studies have confirmed earlier suspicions that exposure to sarin, in combination with other contaminants such as pesticides and PB were related to reports of veteran illness. Estimates range from 100,000 to 300,000 individuals exposed to nerve agents.[41]

While low-level exposure to nerve agents has been suggested as the cause of GWI, the 2008 report by the U.S. Department of Veterans Affairs (VA) Research Advisory Committee on Gulf War illnesses (RAC) stated that "evidence is inconsistent or limited in important ways."[42] The VA's 2014 RAC report concluded that, "exposure to the nerve gas agents sarin/cyclosarin has been linked in two more studies to changes in structural magnetic resonance imaging findings that are associated with cognitive decrements, further supporting the conclusion from evidence reviewed in the 2008 report that exposure to these agents is etiologically important to the central nervous system dysfunction that occurs in some subsets of Gulf War veterans."[11]

Less likely causes[edit]

According to the VA's 2008 RAC report, "For several Gulf War exposures, an association with Gulf War illness cannot be ruled out. These include low-level exposure to nerve agents, close proximity to oil well fires, receipt of multiple vaccines, and effects of combinations of Gulf War exposures." However, several potential causes of GWI were deemed, "not likely to have caused Gulf War illness for the majority of ill veterans," including "depleted uranium, anthrax vaccine, fuels, solvents, sand and particulates, infectious diseases, and chemical agent resistant coating (CARC)," for which "there is little evidence supporting an association with Gulf War illness or a major role is unlikely based on what is known about exposure patterns during the Gulf War and more recent deployments."[42]

The VA's 2014 RAC report reinforced its 2008 report findings: "The research reviewed in this report supports and reinforces the conclusion in the 2008 RACGWVI report that exposures to pesticides and pyridostigmine bromide are causally associated with Gulf War illness. Evidence also continues to demonstrate that Gulf War illness is not the result of psychological stressors during the war." It also found additional evidence since the 2008 report for the role of sarin in GWI, but inadequate evidence regarding exposures to oil well fires, vaccines, and depleted uranium to make new conclusions about them.[11]

Oil well fires[edit]

During the war, many oil wells were set on fire in Kuwait by the retreating Iraqi army, and the smoke from those fires was inhaled by large numbers of soldiers, many of whom suffered acute pulmonary and other chronic effects, including asthma and bronchitis. However, firefighters who were assigned to the oil well fires and encountered the smoke, but who did not take part in combat, have not had GWI symptoms.[14](pp148, 154, 156) The 2008 RAC report states that "evidence [linking oil well fires to GWI] is inconsistent or limited in important ways."[42]

Anthrax vaccine[edit]

Iraq had loaded anthrax, botulinum toxin, and aflatoxin into missiles and artillery shells in preparing for the Gulf War and these munitions were deployed to four locations in Iraq.[43] During Operation Desert Storm, 41% of U.S. combat soldiers and 75% of UK combat soldiers were vaccinated against anthrax.[14](p73) Reactions included local skin irritation, some lasting for weeks or months.[44] While the Food and Drug Administration (FDA) approved the vaccine, it never went through large-scale clinical trials.[45]

While recent studies have demonstrated the vaccine is highly reactogenic,[46] and causes motor neuron death in mice,[47] there is no clear evidence or epidemiological studies on Gulf War veterans linking the vaccine to Gulf War illness. Combining this with the lack of symptoms from current deployments of individuals who have received the vaccine led the Committee on Gulf War Veterans' Illnesses to conclude that the vaccine is not a likely cause of Gulf War illness for most ill veterans.[9] However, the committee report does point out that veterans who received a larger number of various vaccines in advance of deployment have shown higher rates of persistent symptoms since the war.[48][9]

Combat stress[edit]

Research studies conducted since the war have consistently indicated that psychiatric illness, combat experience or other deployment-related stressors do not explain Gulf War veterans illnesses in the large majority of ill veterans, according to a U.S. Department of Veterans Affairs (VA) review committee.[*citation needed*]

An April 2010 Institute of Medicine review found, "the excess of unexplained medical symptoms reported by deployed [1991] Gulf war veterans cannot be reliably ascribed to any known psychiatric disorder",[49] although they also concluded that "the constellation of unexplained symptoms associated with the Gulf War illness complex could result from interplay between both biological and psychological factors."[50]

Pathobiology[edit]

Chronic inflammation[edit]

The 2008 VA report on *Gulf War illness and the Health of Gulf War Veterans* suggested a possible link between GWI and chronic, nonspecific inflammation of the central nervous system that cause pain, fatigue and memory issues, possibly due to pathologically persistent increases in cytokines and suggested further research be conducted on this issue.[51]

Diagnosis[edit]

Clinical diagnosis of Gulf War illness has been complicated by multiple case definitions. In 2014, the National Academy of Sciences Institute of Medicine (IOM)—contracted by the U.S. Department of Veterans Affairs for the task—released a report concluding that the creation of a new case definition for chronic multisymptom illness in Gulf War veterans was not possible because of insufficient evidence in published studies regarding its onset, duration, severity, frequency of symptoms, exclusionary criteria, and laboratory findings. Instead, the report recommended the use of two case definitions, the "Kansas" definition and the "Centers for Disease Control and Prevention (CDC)" definition, noting: "There is a set of symptoms (fatigue, pain, neurocognitive) that are reported in all the studies that have been reviewed. The CDC definition captures those three symptoms; the Kansas definition also captures them, but it also includes the symptoms reported most frequently by Gulf War veterans."[52]

The Kansas case definition is more specific and may be more applicable for research settings, while the CDC case definition is more broad and may be more applicable for clinical settings.[52]

Classification[edit]

Medical ailments associated with service in the 1990–1991 Gulf War have been recognized by both the U.S. Department of Defense and the U.S. Department of Veterans Affairs.[4]

Before 1998, the terms *Gulf War syndrome, Gulf War veterans' illness, unexplained illness*, and *undiagnosed illness* were used interchangeably to describe chronic unexplained symptoms in veterans of the 1991 Gulf War. The term *chronic multisymptom illness* (CMI) was first used following publication of a 1998 study[35] describing chronic unexplained symptoms in Air Force veterans of the 1991 Gulf War.[31]

In a 2014 report contracted by the U.S. Department of Veterans Affairs, the National Academy of Sciences Institute of Medicine recommended the use the term *Gulf War illness* rather than *chronic multisymptom illness*.[52] Since that time, relevant publications by the National Academy of Science and the U.S. Department of Defense have used only the term *Gulf War illness* (GWI).

The U.S. Department of Veterans Affairs (VA) confusingly still uses an array of both old and new terminology for *Gulf War illness*. VA's specialty clinical evaluation War Related Illness and Injury Study Centers (WRIISCs) use the recommended term *Gulf War illness*,[53] as do VA's Office of Research and Development (VA-ORD) and many recent VA research publications.[54] However, VA's Public Health website still uses *Gulf War veterans' medically unexplained illnesses*, *chronic multi-symptom illness* (CMI), and *undiagnosed illnesses*, but explains that VA doesn't use the term *Gulf War syndrome* because of varying symptoms.[55]

The Veterans Health Administration (VHA) originally classified individuals with related ailments believed to be connected to their service in the Persian Gulf a special non-ICD-9 code DX111, as well as ICD-9 code V65.5.[56]

Kansas definition[edit]

In 1998, the State of Kansas Persian Gulf Veterans Health Initiative sponsored an epidemiological survey led by Dr. Lea Steele of deployment-related symptoms in 2,030 Gulf War veterans. The result was a "clinically based descriptive definition using correlated symptoms" in six symptom groups: fatigue and sleep problems, pain, neurologic and mood, gastrointestinal, respiratory symptoms, and skin (dermatologic) symptoms.[52]

To meet the "Kansas" case definition, a veteran of the 1990–91 Gulf War must have symptoms in at least three of the six symptom domains, which during the survey were scored based on severity ("severity"). Symptom onset must have developed during or after deploying to the 1990–91 Gulf War theatre of operations ("onset") and must have been present in the year before interview ("duration"). Participants were excluded if they had a diagnosis of or were being treated for any of several conditions that might otherwise explain their symptoms ("exclusionary criteria"), including cancer, diabetes, heart disease, chronic infectious disease, lupus, multiple sclerosis, stroke, or any serious psychiatric condition.[52]

Applying the Kansas case definition to the original Kansas study cohort resulted in a prevalence of Gulf War illness of 34.2% in Gulf War veterans and 8.3% in nondeployed Gulf War era veterans, or an excess rate of GWI of 26.3% in Gulf War veterans.[52]

CDC definition[edit]

Also in 1998, a study published by Dr. Keiji Fukuda under the auspices of the U.S. Centers for Disease Control and Prevention (CDC) examined chronic multisymptom illness through a cross-sectional survey of 3,675 ill and healthy U.S. Air Force veterans of the 1990–91 Gulf War, including from a Pennsylvania-based Air National Guard unit and three comparison Air Force units. The CDC case definition was derived from clinical data and statistical analyses.[52]

The result was a symptom-category approach to a case definition, with three symptom categories: fatigue, mood–cognition, and musculoskeletal. To meet the case definition, the veteran of the 1990–91 Gulf War must have symptoms in two of the three categories and have experienced the illness for six months or longer ("duration").[52]

The original study also including a determination of severity of symptoms ("severity"). "Severe cases were identified if at least one symptom in each of the required categories was rated as severe. Of 1,155 participating Gulf War veterans, 6% had severe CMI, and 39% had mild to moderate CMI; of the 2,520 nondeployed era veterans Of 1,155 participating Gulf War veterans, 6% had severe CMI, and 39% had mild to moderate CMI; of the 2,520 nondeployed era veterans, 0.7% had severe and 14% had mild to moderate CMI."[52]

Treatment[edit]

A 2013 report by the Institute of Medicine reviewed the peer-reviewed published medical literature for evidence regarding treatments for symptoms

associated with *chronic multisymptom illness* (CMI) in 1990–91 Gulf War veterans, and in other chronic multisymptom conditions. For the studies the report reviewed that were specifically regarding CMI in 1990–91 Gulf War veterans (*Gulf War illness*), the report made the following conclusions:[31]

- Doxycycline: "Although the study of doxycycline was found to have high strength of evidence and was conducted in a group of 1991 Gulf War veterans who had CMI, it did not demonstrate efficacy; that is, doxycycline did not reduce or eliminate the symptoms of CMI in the study population."
- Cognitive Behavioral Therapy (CBT) and Exercise: "These studies evaluated the effects of exercise and CBT in combination and individually. The therapeutic benefit of exercise was unclear in those studies. Group CBT rather than exercise may confer the main therapeutic benefit with respect to physical symptoms."

The report concluded: "On the basis of the evidence reviewed, the committee cannot recommend any specific therapy as a set treatment for [Gulf War] veterans who have CMI. The committee believes that a 'one-size-fits-all' approach is not effective for managing [Gulf War] veterans who have CMI and that individualized health care management plans are necessary."[31]

By contrast, the U.S. Department of Defense (DoD) noted in a May 2018 publication that the primary focus of its Gulf War illness Research Program (GWIRP) "has been to fund research studies to identify treatment targets and test interventional approaches to alleviate symptoms. While most of these studies remain in progress, several have already shown varying levels of promise as GWI treatments."

According to the May 2018 DoD publication:[57][*excessive quote*]

> ***Published Results on Treatments***
>
> *The earliest federally funded multi-center clinical trials were VA- and DoD-funded trials that focused on antibiotic treatment (doxycycline) (Donta, 2004) and cognitive behavioral therapy with exercise (Donta, 2003). Neither intervention provided long-lasting improvement for a substantial number of Veterans.*
>
> *Preliminary analysis from a placebo-controlled trial showed that 100 mg of Coenzyme Q10 (known as CoQ10 or Ubiquinone) significantly improved general self-reported health and physical functioning, including among 20 symptoms, each of which was present in at least half of the study participants, with the exception of sleep. These improvements included reducing commonly reported symptoms of fatigue, dysphoric mood, and pain (Golomb, 2014). These results are currently being expanded in a GWIRP-funded trial of a "mitochondrial cocktail" for GWI of CoQ10 plus a number of nutrients chosen to support cellular energy production and defend against oxidative stress. The treatment is also being investigated in a larger, VA- sponsored Phase III trial of Ubiquinol, the reduced form of CoQ10.*
>
> *In a randomized, sham-controlled VA-funded trial of a nasal CPAP mask (Amin, 2011-b), symptomatic GW Veterans with sleep-disordered breathing receiving the CPAP therapy showed significant improvements in fatigue scores, cognitive function, sleep quality, and measures of physical and mental health (Amin, 2011a).*
>
> *Preliminary data from a GWIRP-funded acupuncture treatment study showed that Veterans reported significant reductions in pain and both primary and secondary health complaints, with results being more positive in the bi-weekly versus weekly treatment group (Conboy, 2012). Current studies funded by the GWIRP and the VA are also investigating yoga as a treatment for GWI.*
>
> *An amino acid supplement containing L-carnosine was found to reduce irritable bowel syndrome-associated diarrhea in a randomized, controlled GWIRP-funded trial in GW Veterans (Baraniuk, 2013). Veterans receiving L-carnosine showed a significant improvement in performance in a cognitive task, but no improvement in fatigue, pain, hyperalgesia, or activity levels.*
>
> *Results from a 26 week GWIRP-funded trial comparing standard care to nasal irrigation with either saline or a xylitol solution revealed that both irrigation protocols reduced GWI respiratory (chronic rhinosinusitis) and fatigue symptoms (Hayer, 2015).*
>
> *Administration of the glucocorticoid receptor antagonist mifepristone to GW Veterans in a GWIRP-funded randomized trial resulted in an improvement in verbal learning, but no improvement in self-reported physical health or other self-reported measures of mental health (Golier, 2016).*
>
> ***Ongoing Intervention Studies***
>
> *The GWIRP is currently funding many early-phase clinical trials aimed at GWI. Interventions include direct electrical nerve stimulation, repurposing FDA-approved pharmaceuticals, and dietary protocols and/or nutraceuticals. Both ongoing and closed GWIRP-supported clinical treatment trials and pilot studies can be found at http://cdmrp.army.mil/gwirp/resources/cinterventions.shtml.*
>
> *A Clinical Consortium Award was offered [in FY2017] to support a group of institutions, coordinated through an Operations Center that will conceive, design, develop, and conduct collaborative Phase I and II clinical evaluations of promising therapeutic agents for the management or treatment of GWI. These mechanisms were designed to build on the achievements of the previously established consortia and to further promote collaboration and resource sharing.*

The U.S Congress has made significant and continuing investment in DoD's Gulf War illness treatment research, with $129 million appropriated for the GWIRP between federal fiscal years (FY) 2006 and 2016.[58] The funding has risen from $5 million in FY2006, to $20 million each year from FY2013 through FY2017,[59] and to $21 million for FY2018.[60]

Prognosis[edit]

According to the May 2018 DoD publication cited above, "Research suggests that the GWI symptomology experienced by Veterans has not improved over the last 25 years, with few experiencing improvement or recovery ... . Many [Gulf War] Veterans will soon begin to experience the common co-morbidities associated with aging. The effect that aging will have on this unique and vulnerable population remains a matter of significant concern, and population-based research to obtain a better understanding of mortality, morbidity, and symptomology over time is needed."[57]

Prevalence[edit]

The 2008 and 2014 VA (RAC) reports and the 2010 IOM report found that the chronic multisymptom illness in Gulf War veterans—Gulf War illness—is more prevalent in Gulf War veterans than their non-deployed counterparts or veterans of previous conflicts.[9][11][49] While a 2009 study found the pattern of comorbidities similar for actively deployed and nondeployed Australian military personnel, the large body of U.S. research reviewed in the VA and IOM reports showed the opposite in U.S. troops.[61] The VA's 2014 RAC report found Gulf War illness in "an excess of 26–32 percent of Gulf War veterans compared to nondeployed era veterans" in pre-2008 studies, and "an overall multisymptom illness prevalence of 37 percent in Gulf War veterans and an excess prevalence of 25 percent" in a later, larger VA study.[11]

According to a May 2018 report by the U.S. Department of Defense, "GWI is estimated to have affected 175,000 to 250,000 of the nearly 700,000 troops deployed to the 1990–1991 GW theater of operations. Twenty-seven of the 28 Coalition members participating in the GW conflict have reported GWI in their troops. Epidemiologic studies indicate that rates of GWI vary in different subgroups of GW Veterans. GWI affects Veterans who served in the U.S. Army and Marines Corps at higher rates than those who served in the Navy and Air Force, and U.S. enlisted personnel are affected more than officers. Studies also indicate that GWI rates differ according to where Veterans were located during deployment, with the highest rates among troops who served in forward areas."[57]

Research[edit]

Epidemiologic studies have looked at many suspected causal factors for Gulf War illness as seen in veteran populations. Below is a summary of epidemiologic studies of veterans displaying multisymptom illness and their exposure to suspect conditions from the 2008 U.S. Department of Veterans Affairs report.[62]

A fuller understanding of immune function in ill Gulf War veterans is needed, particularly in veteran subgroups with different clinical characteristics and exposure histories. It is also important to determine the extent to which identified immune perturbations may be associated with altered neurological and endocrine processes that are associated with immune regulation.[63] Very limited cancer data have been reported for U.S. Gulf War veterans in general, and no published research on cases occurring after 1999. Because of the extended latency periods associated with most cancers, it is important that cancer information is brought up to date and that cancer rates be assessed in Gulf War veterans on an ongoing basis. In addition, cancer rates should be evaluated in relation to identifiable exposure and location subgroups.[64]

[...]

Controversies[edit]

An early argument in the years following the Gulf War was that similar syndromes have been seen as an after effect of other conflicts — for example, "shell shock" after World War I, and post-traumatic stress disorder (PTSD) after the Vietnam War.[66] Cited as evidence for this argument was a review of the medical records of 15,000 American Civil War soldiers showing that "those who lost at least 5% of their company had a 51% increased risk of later development of cardiac, gastrointestinal, or nervous disease."[67]

Early Gulf War research also failed to accurately account for the prevalence, duration, and health impact of Gulf War illness. For example, a November 1996 article in the *New England Journal of Medicine* found no difference in death rates, hospitalization rates, or self-reported symptoms between Persian Gulf veterans and non-Persian Gulf veterans. This article was a compilation of dozens of individual studies involving tens of thousands of veterans. The study did find a statistically significant elevation in the number of traffic accidents suffered by Gulf War veterans.[68] An April 1998 article in *Emerging Infectious Diseases* similarly found no increased rate of hospitalization and better health on average for veterans of the Persian Gulf War in comparison to those who stayed home.[69]

In contrast to those early studies, in January 2006, a study led by Melvin Blanchard published in the *Journal of Epidemiology*, part of the "National Health Survey of Gulf War-Era Veterans and Their Families", found that veterans deployed in the Persian Gulf War had nearly twice the prevalence of chronic multisymptom illness, a cluster of symptoms similar to a set of conditions often at that time called Gulf War Syndrome.[70]

> Louis Jones Jr. claimed Gulf War syndrome as a defense in his murder trial

On November 17, 2008, the Department of Veterans Affairs (VA) Research Advisory Committee on Gulf War Veterans' Illnesses (RAC), a Congressionally mandated federal advisory committee composed of VA-appointed clinicians, researchers, and representative Gulf War veterans,[71] issued a major report announcing scientific findings, in part, that "*Gulf War illness is real*", that GWI is a distinct physical condition, and that it is not psychological in nature. The 454 page report reviewed 1,840 published studies to form its conclusions identifying the high prevalence of Gulf War illness, suggesting likely causes rooted in toxic exposures while ruling out combat stress as a cause, and opining that treatments likely could be found. It recommended that Congress increase funding for treatment-focused Gulf War illness research to at least $60 million per year.[72][42]

In March 2013, a hearing was held before the Subcommittee on Oversight and Investigations of the Committee on Veterans' Affairs, U.S. House of Representatives, to determine not whether Gulf War illness exists, but rather how it is identified, diagnosed and treated, and how the tools put in place to aid these efforts have been used.[73]

By 2016, the National Academy of Sciences, Engineering, and Medicine (NASEM) concluded there was sufficient evidence of a positive association between deployment to the 1990–1991 Gulf War and Gulf War illness.[74]

Jones controversy[edit]

Louis Jones Jr., the perpetrator of the 1995 murder of Tracie McBride, stated that the Gulf War syndrome caused him to commit the crime and he sought clemency, hoping to avoid the death penalty given to him by a federal court.[75] Jones was executed in 2003.[76]

Related legislation[edit]

On March 14, 2014, Representative Mike Coffman introduced the Gulf War Health Research Reform Act of 2014 (H.R. 4261; 113th Congress) into the United States House of Representatives, where it passed the House by unanimous consent but then died in Congress when the Senate failed to take action on it.[77] The bill would have altered the relationship between the Research Advisory Committee on Gulf War Veterans' Illnesses (RAC) and the United States Department of Veterans Affairs (VA) under which the RAC is constituted. The bill would have made the RAC an independent organization within the VA, require that a majority of the RAC's members be appointed by Congress instead of the VA, and authorized the RAC to release its reports without needing prior approval from the VA Secretary.[78][79] The RAC is responsible for investigating Gulf War illness, a chronic multisymptom disorder affecting returning military veterans of the 1990–91 Gulf War.[4]

In the year prior to the consideration of this bill, the VA and the RAC were at odds with one another.[79] The VA replaced all but one of the members of the RAC, removed some of their supervisory tasks, tried to influence the board to decide that stress, rather than biology was the cause of Gulf War illness, and told the RAC that it could not publish reports without permission.[79] The RAC was created after Congress decided that the VA's research into the issue was flawed, and focused on psychological causes, while mostly ignoring biological ones.[79]

The RAC was first authorized under the Veterans Programs Enhancement Act of 1998 (Section 104 of Public Law 105-368, enacted November 11, 1998, and now codified as 38 U.S.C. § 527 note).[21][22] While the law directing its creation mandated that it be established not later than January 1, 1999,[22] the RAC's first charter was not issued until January 23, 2002, by VA Secretary Anthony Principi.[80] The RAC convened for its first meetings on April 11–12, 2002.[14]

Dr. William Arthur Hagan (born 1893)

Bio from Cornell -

See [HE001W][GDrive]

William Arthur Hagan October 14, 1893 — February 1, 1963 Professor Emeritus William Arthur Hagan died at the age of sixty-nine while on a plane traveling from New York to London. He was associated with Cornell University for over forty-six years as a graduate student, teacher, Dean, and Professor Emeritus. He retired from active service as Dean of the Veterinary College June 30, 1959, and became director of the National Animal Disease Laboratory at Ames, Iowa, a position that he held at the time of his death. His name is inextricably linked with the marked advancement of veterinary medicine during the past half-century.Born at Fort Scott, Kansas on October 14, 1893, **William Arthur Hagan received his preparatory education in Kansas schools and studied at Kansas State College, Manhattan, where he received the degree of Doctor of Veterinary Medicine in 1915**. He remained there for one year as an assistant in pathology and then came to Cornell in 1916 as an instructor in obstetrics. In 1917, he received the M.S. and was appointed instructor in pathology and bacteriology. He became Assistant Professor of Bacteriology in 1918 and Professor in 1919. In 1926, he was selected to head the Department of Pathology and Bacteriology. **Then in 1932, at the age of thirty-eight he was made Dean of the Veterinary College just sixteen years after he arrived at Cornell**.In addition to his exceptional mental endowment, Dr. Hagan possessed abundant energy and a great capacity for work. Not only were his regular duties more than adequately performed, but he successfully dealt with many other commitments. He was an assistant in the Department of Animal Pathology of the Rockefeller Institute in 1921-1922. He was a member of the American Veterinary Medical Association Committee and Council on Education 1938-1950. During the year 1943-1944 he was special assistant to Dr. A. W. Miller, United States Department of Agriculture. He served on the executive board of the American Veterinary Medical Association for five years and was chairman in 1944-1945. Following World War II, in 1945, he was appointed to membership on the United States Control Council in Germany, to aid in the rehabilitation of German veterinary colleges. I**n 1946-47, he was a member of the Secretary of Agriculture's Advisory Committee on Foot-and-Mouth Disease and contributed to the establishment of a United State Department of Agriculture center for research on this disease at Plum Island, New York**. He was elected president of the American Veterinary Medical Association for 1947-1948. In 1947, Governor Dewey appointed him to the New York Food Commission to recommend measures "to meet the present critical situation with respect to food and proper nutrition." In 1949, he became a member of the executive committee of

the Association of Land Grant Colleges and Universities. He served for many years as the United States member of the Permanent Committee of the International Veterinary Congresses. He was a delegate to the fifteenth International Veterinary Congress held at Stockholm in 1953 and Chairman of the United States Committee to the sixteenth International Veterinary Congress held in Madrid in 1959. In 1954, he was made Civilian National Veterinary Consultant to the Surgeon General of the United States. Two years later he was selected by the Secretary of Agriculture as Chairman of the Advisory Committee to Eradicate Brucellosis. In 1958 he headed a delegation of six veterinarians who visited the Soviet Union to study its livestock industry. During the following year he served as trustee of the Morris Animal Foundation, represented the American Veterinary Medical Association on the Ralston Purina Research Fellowship Awards Committee, and was elected vice president of the World Veterinary Association. He was also a member of many professional organizations.His many activities, in addition to the administration of the New York State Veterinary College, did not occupy all of Dr. Hagan's time, for he achieved a notable record in research and writing. He published more than 126 scientific articles. He was a contributor to Stedman's Medical Dictionary and to numerous other professional books. He was author of the textbook, The Infectious Diseases of Domestic Animals, which appeared in 1943 and is now in its fourth edition. A co-author, D. W. Bruner, was enlisted beginning with the second edition.The many accomplishments of Dr. Hagan did not go unrecognized, and numerous honors were awarded him. **As early as 1925 the International Education Board designated him a European Fellow with the privilege of attending the Robert Koch Institute for Infectious Diseases in Berlin for one year.** In 1938, he was granted the honorary degree, D.Sc., by Kansas State University. In 1941, he was presented with the Silver Beaver award, the highest mark of recognition in the scout movement, by the Louis Agassiz Fuertes Scout Council. In 1948 he was made Veterinarian of the Year on the basis of a nationwide poll conducted by Gaines Dog Research Center. Ten years later the New York State Veterinary Medical Association chose him as their Veterinarian of the Year. Honorary memberships were conferred upon him by the Royal College of Veterinary Surgeons, Great Britain; the Royal Veterinary Society, Sweden; the Hellenic National Veterinary Society, Greece; and the Veterinary Academy, France. In 1959, he was cited by the New York State Conference Board of Farm Organizations for outstanding services to agriculture. He was the winner of the Twelfth International Veterinary Congress prize in 1960 and of the American Veterinary Medical Association annual award in 1962. The honorary degree, LL.D., was conferred on him by the University of Toronto in 1962. His name appears in Who's Who in America.

The modern veterinary buildings at Cornell are a testimonial to his foresight, planning, and efforts. As memorials to Dr. Hagan, the New York State Veterinary Alumni Association in 1960 established the Hagan Student Loan Fund at Cornell, and in 1962 the faculty meeting room in the Veterinary College was designated "The Hagan Room."Dr. Hagan's reputation as an international figure in the field of veterinary education was based on solid ground. In the area of research he made important contributions to our knowledge of brucellosis and paratuberculosis. He was an excellent lecturer, writer, and teacher. He continued to teach a course in infectious diseases in the New York State Veterinary College until he retired. He was in constant demand everywhere as a lecturer and as an authority on all matters pertaining to veterinary medicine.The interests of this truly educated man were not limited to veterinary medicine. He was amazingly well informed in many fields. Regardless of the demands on his time, he was never too busy to discuss any problem with a student, staff member, or with anyone else who wished his counsel. He possessed an engaging personality, a great love of life, a keen sense of humor, and an interest in everything. He had a large circle of friends who will forever miss him.He married Esther Grace Lyon August 29, 1917, in Nickerson, Kansas. Their children are a son, William L. Hagan of Norwalk, Connecticut, and two daughters, Miss Janet Ann Hagan of New York City and Mrs. John L. Hyde of Southold, Long Island. Other survivors are five grandchildren; a brother, James S. Hagan of Los Altos, California; two nieces; and a nephew.Donald W. Baker, Myron G. Fincher, Dorsey W. Brun

- University of Oxford (PhD)
- University of Cambridge (PhD)

Occupation Professor

Stefan A. Halper (born June 4, 1944) is an American foreign policy scholar and retired Senior Fellow at the University of Cambridge where he is a Life Fellow at Magdalene College.[1] He served as a White House official in the Nixon, Ford, and Reagan administrations, and was reportedly in charge of the spying operation by the 1980 Ronald Reagan presidential campaign that became known as "Debategate". Through his decades of work for the CIA, Halper has had extensive ties to the Bush family.[2] Through his work with Sir Richard Billing Dearlove, he had ties to the British Secret Intelligence Service MI6.

Halper acted as an FBI informant during the bureau's investigation into Russian interference in the 2016 United States elections. A subsequent Inspector General report later named Halper as a "confidential human source", reporting on the conversations of officials within the Donald Trump campaign. [3][4]

Education

Halper[5] graduated from Stanford University in 1967.[6] *[NOTE - This means he would have started there for the 1963-1964 school year.* ***Donald Barr (born 1921)*** *became headmaster at Dalton in 1964. It is not clear if they met. [HN00JU][GDrive]]* Halper received a Ph.D. from the University of Oxford in 1971.[6] He was appointed Director of American Studies at the University of Cambridge's longstanding Department of Politics and International Studies in 2001.[1][6] He received a second Ph.D. from the University of Cambridge in 2004.[6]

Career

United States government (1971–1984)

Halper began his United States government career in 1971 in the United States Domestic Policy Council, part of the executive office of the president, serving until 1973.[6] He then served in the office of management and budget until 1974, when he moved to the office of the White House chief of staff as assistant to the chief of staff where he had responsibility for a range of domestic and international issues. During this time, **Halper worked as an assistant for three chiefs of staff, Alexander Haig, Donald Rumsfeld, and Dick Cheney. He held this position until January 20, 1977**.[6]

In 1977, Halper became Special Counsel to the Congressional Joint Economic Committee and Legislative Assistant to Senator William Roth (R-Del.).[6] In 1979 he became National Policy Director for George H. W. Bush's Presidential campaign and then in 1980 he became Director of Policy Coordination for the Reagan- Bush Presidential campaign.[6]

Halper played a central role in a scandal in the 1980 election. But it was not until several years after Reagan's victory over Carter that this scandal emerged. In connection with his position Halper's name came up in the 1983/4 investigations into the Debategate affair, which was a spying scandal in which Central Intelligence Agency (CIA) officials passed classified information about Carter administration's foreign policy to Reagan campaign officials in order to ensure the Reagan campaign knew of any foreign policy decisions that Carter was considering (Iran hostage crisis). Reagan Administration officials cited by *The New York Times* described Halper as "the person in charge" of the operation.[7][8] Halper called the report "just absolutely untrue".[9]

In 1983, United Press International (UPI) suggested that Halper's handler for this operation was Reagan's Vice Presidential candidate, ex-CIA-Director George H. W. Bush, who worked with Halper's father-in-law, ex-CIA-Deputy-Director [**Ray Steiner Cline (born 1918)**] .[9] After Reagan entered the White House, Halper became Deputy Assistant Secretary of State for Political-Military Affairs.[6] Upon leaving the Department in 1984, he remained a Senior Advisor to the Department of Defense and a Senior Advisor to the Department of Justice until 2001.[6][2][10]

Business (1984–1990)

From 1984 to 1990 Halper was chairman and majority shareholder of the Palmer National Bank of Washington, D.C., the National Bank of Northern Virginia and the George Washington National Bank.[6] Palmer National Bank was used to transfer money to Swiss Bank Accounts controlled by White House aid Oliver North.[11]

According to Peter Dale Scott's book *The Iran-Contra Connection: Secret Teams and Covert Operations in Reagan Era* on the Iran–Contra affair, Ray Cline's son-in-law Roger Fontaine "made at least two visits to Guatemala in 1980 ... (with General Sumner) drafting the May 1980 Santa Fe Statement, which said that World War III was already underway in Central America against the Soviets and that Nicaragua was the enemy. And some Reagan aides felt that Halper "was receiving information from the CIA."[12]

The Palmer National Bank, where Halper worked, was described as "the D.C. hub by which Lt. Col. Oliver North sent arms and money to the anti-Sandinista guerrilla Contras in Nicaragua. One of Palmer's founders, Stefan Halper, had no previous banking experience, but was George H.W. Bush's foreign policy director during Bush's unsuccessful 1980 presidential campaign." [13]

Academic and media (1986–2000)

From 1986 to 2000 Halper wrote a national security and foreign policy-focused weekly newspaper column, syndicated to 30 newspapers.[6]

Halper has worked as a senior foreign policy advisor to various think-tanks and research institutions, including the Center for Strategic and International Studies, and The Center for the National Interest, where he is a Distinguished Fellow. He has served on the Advisory Board of Directors of the Paul H. Nitze School of Advanced International Studies and contributed to various magazines, journals, newspapers and media outlets. These include: *The Washington Post*, *Los Angeles Times*, *The Wall Street Journal*, the BBC, CNN, SKY NEWS, ABC, CBS, NBC, C-Span, and a range of radio outlets.

Professor Halper is a member of the Cosmos Club in Washington D.C., and the Travellers Club in London.

United States government research (2012–2016)

From 2012 to 2016 Halper received $1 million in contracts for "social sciences and humanities" research from the Defense department's Office of Net Assessment, some of which Halper subcontracted to other researchers. Forty percent of the money had been awarded before Trump announced his candidacy in 2015.[14]

Secretive opposition research for the 1980 Reagan Campaign

The New York Times reported that for Ronald Reagan's 1980 campaign, Halper was the "person in charge" of running a "highly secretive" operation to get "inside information" about the Carter Administration's foreign policy and pass it to the Reagan campaign. Halper was running the operation out of Reagan's campaign headquarters according to Reagan Administrative officials. Those sources also said that several other retired Central Intelligence Agency officials were involved in the operation. Halper had been the deputy director of the State Department's Bureau of Political-Military Affairs shortly before

taking on the operation research assignment. Halper was officially a campaign aide responsible for providing 24 hour news updates and policy ideas. Halper, worked under Robert Garrick, the director of campaign operations, who in a telephone interview said that Halper was *supposed to help with communications, but I kind of thought he had another agenda going -he was always on the phone with the door closed, and he never called me in and discussed it with me.* David Prosperi, another Reagan campaign aide, said, *He provided us with wire stories and Carter speeches, but people talked about his having a network that was keeping track of things inside the Government, mostly in relation to the October Surprise.* Ray S. Cline, Halper's father-in-law and a former senior Central Intelligence official, dismissed the Reagan aides' disclosures as a *romantic fallacy.*[15]

FBI Operation 'Crossfire Hurricane'

Halper acted as an FBI informant for Crossfire Hurricane, the FBI's investigation into Russian interference in the 2016 United States elections, and was a subject of the Spygate conspiracy theory initiated by President Donald Trump in May 2018. His FBI handler, initially identified only as "Case Agent 1", was later identified as Stephen M. Somma, a counterintelligence investigator.[16] Trump's theory falsely alleges that the Obama administration implanted a paid spy in the 2016 Trump campaign "for political purposes" to gather information in support of Hillary Clinton's candidacy.[17][18] Beginning in summer 2016, Halper spoke separately to three Trump campaign advisers – Carter Page, Sam Clovis and George Papadopoulos – but there is no evidence that Halper had actually joined Trump's campaign. Halper first met Carter Page at a symposium at the University of Cambridge organized by Steven Schrage.[19]

Page said that he "had extensive discussions" with Halper on "a bunch of different foreign-policy-related topics", ending in September 2017.[20] A former federal law enforcement official told *The New York Times* that their initial encounter at a London symposium on July 11–12, 2016 was a coincidence, rather than at the direction of the FBI.[21][20] Clovis's attorney said that Clovis and Halper had discussed China during their sole meeting on August 31 or September 1, 2016.[20] On September 2, 2016, Halper contacted Papadopoulos, inviting him to London and to write a paper on Mediterranean oil fields, which he did.[20] On September 15, 2016, Halper asked Papadopoulos if he knew of any Russian efforts to disrupt the election campaign; Papadopoulos twice denied he did, despite Joseph Mifsud telling him the previous April that Russians had embarrassing Hillary Clinton emails, and Papadopoulos bragging about it to Alexander Downer in May. *The New York Times* reported in April 2019 that the FBI had asked Halper to approach Page and Papadopoulos, although it was not clear if he had been asked to contact Clovis.[22] In May 2019, the *Times* reported that Page had urged Halper to meet with Clovis and that the FBI was aware of the meeting but had not instructed Halper to ask Clovis about Russia matters. The *Times* also reported that the FBI also sent an investigator using the name Azra Turk to meet with Papadopoulos, while posing as Halper's assistant. The *Times* stated that the FBI considered it essential to add a trained and trusted investigator like Turk as a "layer of oversight", in the event the investigation was ultimately prosecuted and the government needed the credible testimony of such an individual, without exposing Halper as a longtime confidential informant.[23]

Trump's Spygate allegations were rebutted,[23][24][25] despite renewed interest in April 2019 after attorney general William Barr testified to Congress that "spying did occur" on the Trump campaign, although his characterization of "spying" was unambiguous and he was specific. He stated he was assembling a team to examine the matter. His statement was based upon the Justice Department inspector general report and who had been looking into it and related matters for some time. Prior to his 2016 activities, Halper had a February 2014 encounter at a London intelligence conference with Michael Flynn, then the head of the Defense Intelligence Agency (DIA) and later a Trump supporter and first national security advisor. Halper became so alarmed by Flynn's close association with a Russian woman that a Halper associate expressed concerns to American authorities that Flynn may have been compromised by Russian intelligence. Flynn was forced out of the DIA six months later, although public accounts at the time cited other reasons for his removal, including his management style and views on Islam.[26]

Lawsuit

The "Russian" woman, former Cambridge academic Svetlana Lokhova sued Halper in 2019 for $25 million,[27] alleging he had conspired with multiple news outlets to spread the false and salacious narrative that she had seduced Flynn on orders from the Russian government. [28] Halper filed a response to the lawsuit in which he declared that he is entitled to the legal immunity ordinarily afforded to federal agents, "even if the lawsuit's allegations are true". Halper's motion to dismiss stated in part:"Private individuals who participate in FBI investigations are subject to the federal common law qualified immunity applicable to government agents." [29]

Department of Justice Report

A 2019 Department of Justice report, according to the New Your Times, reports that an undercover F.B.I. agent posed as Mr. Halper's assistant during a 2016 London meeting with George Papadopoulos. However, the report's author, Michael Horowitz, did not find any evidence that Mr. Halper tried to infiltrate the Trump campaign. [1]

Consideration for Trump administration role

Axios reported in May 2018 that during the transition Trump top trade advisor Peter Navarro had recommended Halper for an ambassadorship.[30]

Personal life

Halper's former wife, Sibyl Cline, is the daughter of the former CIA deputy director for intelligence, Ray S. Cline.[8]

He retired from Cambridge University in 2015, and now lives in Virginia in the U.S. He consults for Crossword Cybersecurity chaired by Sir Richard Dearlove, the former head of MI6.[31]

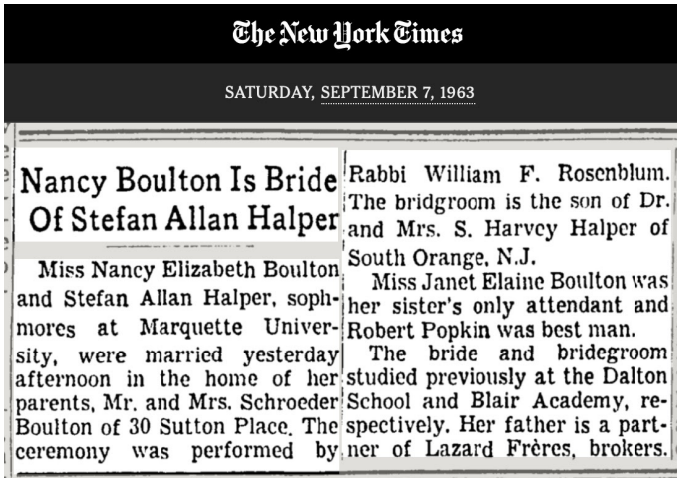
Books

He is the co-author of the bestselling book *America Alone: The Neo-Conservatives and the Global Order*, published by the Cambridge University Press in 2004, and also co-author of *The Silence of the Rational Center: Why American Foreign Policy is Failing* (2007). In April 2010, his book *The Beijing Consensus: Legitimizing Authoritarianism in Our Time* was published by Basic Books. Also a bestseller, it has been published in Japan, Taiwan, China, South Korea, and France.[*citation needed*]

Awards

Halper is a recipient of the State Department's Superior Honor Award, the Justice Department's Director's Award, and the Defense Department's Superior Honor Award.

1963 (Sep 07) - First wedding



The New York Times

SATURDAY, SEPTEMBER 7, 1963

Nancy Boulton Is Bride Of Stefan Allan Halper

Miss Nancy Elizabeth Boulton and Stefan Allan Halper, sophmores at Marquette University, were married yesterday afternoon in the home of her parents, Mr. and Mrs. Schroeder Boulton of 30 Sutton Place. The ceremony was performed by Rabbi William F. Rosenblum. The bridgroom is the son of Dr. and Mrs. S. Harvey Halper of South Orange, N.J.

Miss Janet Elaine Boulton was her sister's only attendant and Robert Popkin was best man.

The bride and bridegroom studied previously at the Dalton School and Blair Academy, respectively. Her father is a partner of Lazard Frères, brokers.

[HN01BJ][GDrive]

Notes on Father-in-law : Schroeder Boulton

Father in law - https://www.nytimes.com/2000/02/23/business/schroeder-boulton-91-wall-st-executive.html

Schroeder Boulton, 91, Wall St. Executive

Feb. 23, 2000

Schroeder Boulton, a 67-year veteran of Wall Street, died on Feb. 13 at his home in Greenwich Village. He was 91 years old.

Mr. Boulton was fond of saying that he was one of just four people who began their careers on Wall Street in the depth of the Depression. He was hired in 1931 to be a research trainee at Baker, Weeks & Harden. In 1936, he graduated from Columbia University, receiving a degree in business.

He went on to work at Lazard Freres & Company and Jesup & Lamont. He retired two years ago as first vice president of Tucker Anthony Inc.

Mr. Boulton was born in Brooklyn in 1909. He was a grandson of Frederick Schroeder, mayor of the City of Brooklyn and founder of the Germania Bank.

In 1935 he married Marjorie Clayton; she died in 1964.

A year later he married Dr. Mary Holzman Bancroft, a psychotherapist who died in 1998.

Mr. and Dr. Boulton were outspoken supporters of the civil rights movement and their Greenwich Village apartment was known as a meeting place for civil rights workers.

His daughter, Nancy Boulton-LeGates, remembers driving through a neighborhood when she was 5 years old and asking her father why anyone would want to live there. She said he answered: "Some people don't have a choice. They need to be helped, and it's our role in life to help them."

Mr. Boulton is survived by two daughters, Janet Boulton, of New York, and **Nancy Boulton-LeGates**, of Lincoln, Mass.; and three stepsons, Carter Bancroft, of Huntington, N.Y., and Michael and John Bancroft, both of Seattle.

1992 - Wedding (3rd) - to Lezlee Janis Brown

Stefan Halper...Stephen Halper...what good spook doesn't have at least a couple of names...

At one time -- in 1963 -- he was Stefan Allan Halper, when he married his first first wife, and his father was Dr. S. Harvey Halper See: https://timesmachine.nytimes.com/timesmachine/1963/09/07/82147616.html?pageNumber=17

Later on he was Stefan Alan Halper (and sometimes Stefan A. Halper) when he married his second first wife, Sibyl Cline, whose father was a senior CIA operative, and his father had become Saul Harvey Halper.

In 1990 he married his first second wife (actually his third wife), Lezlee Brown (who is sometimes known as Lezlee Brown Halper).

I think he has also gone by Steven Halper from time to time...and possibly Mr. Azra Turk. :)

https://westvirginia.forums.rivals.com/threads/who-hired-stefan-halper.202176/

Stefan Halper, the Cambridge University con man that the Obama administration hired to brush up against the Trump campaign, is not a household name, thanks to the Fake News media, which refuses to cover Spygate honestly. Had this fraud, who enriched himself for years at taxpayer expense (during the Obama administration he pulled down hundreds of thousands of dollars for phony-as-hell research projects at the Department of Defense), spied on a Democratic presidential candidate at the direction of a Republican administration, he would have reporters staked out in front of his house 24/7. As it is, the "Walrus," as the Brits nicknamed him, can probably waddle around his "Virginia farm" (which was one of the places where he tried to entrap Carter Page) without any trouble from pesky journalists.

A few weeks ago, the media reported that the White House had ordered the FBI to disclose more information about Halper. Naturally, Justice Department officials are dragging their feet. So we still don't know who hired Halper: Did John Brennan hire him? Or Peter Strzok? Did Brennan's "working Langley group," which had been meeting before the FBI investigation officially began in July 2016, discuss hiring Halper? Did Brennan's gang get a recommendation from British intelligence to use Halper?

We know from existing press accounts that Halper, who ran a forum for British spies at Cambridge University, had ties to many, if not all, of the sorry players in this London-to-Langley farce. We also know from those accounts that Halper had been spying on Michael Flynn since 2014, around the time Flynn had left defense intelligence in the Obama administration and become persona non grata in the eyes of John Brennan for opposing his feeble approach to Islamic terrorism.

***TAS* has spoken to old colleagues of Halper and they describe him as "bumptious," a "blowhard," and an avaricious fraud who entered the Deep State through a door opened by his father-in-law at the CIA, Ray Cline. After Halper behaved foolishly during the 1980 Reagan campaign, he tried to get a job in the new administration. But initially he couldn't; Reagan aides had sized him up as a jackass.** Halper persisted and eventually nabbed a phony-baloney position in the State Department.

But say this for Halper: he knows how to wedge his finger into DC's pies. The Walrus scented a final meal in the 2016 campaign. He assumed Hillary (whom he endorsed in press reports while simultaneously spying for the Obama administration against her opponent!) would win and reward him with a new gusher of Deep State cash.

Little did the Walrus realize that he would find himself exposed at the swamp's bottom as Trump began to drain it. Less James Bond than a balloonish Johnny English, Halper has now outlived his usefulness, both to Langley and British intelligence.

It is depressing how DC operates, but it is also very funny. The CIA has long been a magnet for gossipy, pseudo-scholarly hacks like Halper. The question Nixon once asked about the CIA remains relevant: "What the hell do those clowns do out there in Langley?" Under Obama, the answer was that they sat around a table with Brennan and Strzok and cooked up schemes to spy on Donald Trump.

British intelligence, which had been keeping a close eye on Trumpworld since the summer of 2015, likely encouraged Brennan and Strzok to use Halper in order to entrap Page and George Papadopoulos. After all, Halper was over there anyways and could use his Cambridge gig as a cover. Moreover, by encouraging the CIA and FBI to use Halper, who was already in their orbit, the Brits could participate in the outcome of the election more directly. It is obvious that the same Trump Derangement Syndrome gripping Brennan and Strzok also infected the British government. It didn't want Trump to win and thereby deepen what it saw as a post-Brexit pit. Christopher Steele, the former British spy whom Hillary hired to defame Trump, was running around with his hair on fire about Brexit's passage and the prospect of a Trump presidency, according to the *New Yorker*'s Jane Mayer.

Out of this hysteria came a Brennan-Brit spy campaign desperate to catch the Trump campaign out in collusion. According to Chuck Ross's reporting in the *Daily Caller*, Halper grew more and more exasperated as his efforts to pump Papadopoulos for information failed. Halper even had his secretary, Azra Turk, try to use her feminine wiles on the minor campaign volunteer in the hopes of coaxing him into a damning admission.

Even China's spies look less ham-handed than Halper. At least its version of Johnny English drove Dianne Feinstein around the Bay Area for a few years. And let's not forget another great moment in Chinese espionage: its attempt to obtain Jorge Bergoglio's medical records from a crooked Spanish monsignor on Beijing's payroll. The monsignor gave the Chinese spies a bogus report, but it didn't matter. They got the commie-leaning pope they wanted anyways, who is now on the cusp of letting atheistic Marxists propose the names of candidates for ecclesiastical vacancies in China. What a world.

Abstract

The 1970 foil meeting at Atlanta, Georgia, of the Interuniversity Communications Council, Inc. (EDUCOM) devoted one day (October 15, 1970 to a consideration of the theoretical and practical aspects of national, regional and local computer networks. The papers which were presented by the morning panel members are reproduced here. In the afternoon concurrent seminars, each exploring a specific type of network in greater depth, gave the participants further opportunity to exchange their views on and experience with the subject.

The meeting came at a time when many universities were beginning to feel severe financial restrictions and a consequent reawakening of interest in resource sharing. The presentations and discussions made it clear that the technology for a nationwide, message - switched, high speed computer link had been developed and that a network which is larger and more powerful might be cheaper as well. The confluence of needs, trends, thoughts and technology which took place at this meeting make it highly significant and perhaps even a watershed, in the development of networks for academic computing.

EDUCOM is a nonprofit consortium of more than one hundred universities and colleges working cooperatively to advance the use of computers and communications technology in higher education. Under the presidency of Henry Chauncey, the six - year - old organization also conducts joint research and development projects involving computer technology, provides special services to members, publishes a quarterly Bulletin, and acts as a spokesman for its members in Washington, as well as in academic circles. EDUCOM's main office is in Princeton, New Jersey.

MISS DOROTHY BUTLER WILL BE WED SEPT. 6

Marriage to Lewis B. Harder to Take Place in Bedford, N. Y.

Miss Dorothy Dyer Butler, daughter of Mrs. James Butler of this city and Bedford Hills, N. Y., and the late Mr. Butler, has completed plans for her marirage to Lewis Bradley Harder, son of Mrs. Crawford Burton of this city and East Hampton, L. I., and Lewis Francis Harder of Philmont, N. Y. The wedding will take place on Sept. 6 in St. Patrick's Roman Catholic Church, Bedford, N. Y., and will be followed by a reception at the country home of the prospective bride's mother.

Miss Butler will have her sister-in-law, Mrs. James Butler, the former Miss Jessie Ewing, as her matron of honor. The other attendants will be Mrs. Samuel B. Moore Jr., the former Miss Genevieve Butler Travers, cousin of the bride-elect; Mrs. Peter H. Dominick, Mrs. Richard A. Springs Jr., the Misses Avery Harder, sister of the prospective bridegroom; Zoe C. Thorne and Reid Handy, all of New York; Mrs. Brooks McCormick of Chicago and Miss Faith Thoron of Boston.

Philip M. Harder will be his brother's best man. The ushers will be John W. Harder, another brother; Pierce J. Butler, brother of the bride-elect; John Reid, John Horton Ijams Jr., Edward Allis 4th of Milwaukee, Frank L. Hinckley of Providence, R. I.; Hubert P. Earle of Philadelphia, Sherman Gray of Salt Lake City, William H. Claflin 3d of Boston and Jackson Porter Dick of Atlanta.

Dorothy Butler Wed in Bedford To L. B. Harder

Bride Escorted by Brother, James Butler Jr., at Nuptials In St. Patrick's Church

Special to THE NEW YORK TIMES.

BEDFORD, N. Y., Sept. 6—Miss Dorothy Dyer Butler, daughter of Mrs. James Butler of New York and Bedford Hills, and the late Mr. Butler, was married here this morning in St. Patrick's Roman Catholic Church to Lewis Bradley Harder, son of Mrs. Crawford Burton of New York and East Hampton, L. I., and Lewis Francis Harder of Philmont, N. Y. The Rev. John Flynn performed the ceremony.

The bride, who was escorted by her brother, James Butler Jr., wore a princess gown of slipper satin made with a fitted basque and heart-shaped neckline. The full overskirt formed a long train at the back. She wore a triangular heirloom rosepoint lace shawl as a veil and carried a bouquet of Eucharist lilies.

1941-09-07-nytimes-pg-41-clip-butler-harder-wedding

Mrs. James Butler Jr., the former Miss Jessie Ewing, sister-in-law of the bride, was the matron of honor and wore a gown of old rose faille taffeta. The other attendants, who were gowned in pale pink faille taffeta were Mrs. Samuel B. Moore Jr., Mrs. Peter H. Dominick, Mrs. Richard A. Springs Jr., all of New York; Mrs. Brooks McCormick of Chicago, the Misses Faith Thoron of Boston, Zoe C. Thorne, Reid Handy, Avery Harder, a sister of the bridegroom, all of New York. All the attendants wore headdresses of two shades of rose velvet trimmed with ostrich plumes and carried small muffs covered with the same colored plumes.

Philip M. Harder was best man for his brother, whose ushers were John W. Harder and Henry U. Harder, other brothers of the bridegroom, Pierce J. Butler, a brother of the bride; John Reid, John Horton Ijams Jr., all of New York; Frank L. Hinckley of Providence, R. I., and Hubert P. Earle of Philadelphia.

After the ceremony a reception was held at the home of the bride's mother at Little Cassiobury, Bedford Hills.

The bride attended Marymount Academy, was graduated from the Westover School and studied at the New York School of Fine and Applied Art. She was introduced to society in December, 1937, and is a member of the Junior League and the Colony Club. Mr. Harder prepared at St. Mark's School and was graduated this June from Harvard University, where he was a member of Hasty Pudding-Institute of 1770 and the Delphic Club.

MRS. PIERCE J. BUTLER

Miss Anne Gaughan, daughter of Mrs. Frank J. Gaughan and the late Attorney Gaughan of Hazleton, and Pierce J. Butler, son of Mrs. Albert Hunt Marckwald of New York City and Bedford Hills, N. Y., and the late James Butler, were married this morning at 11 oclock at St. Gabriel's Church, Hazleton. The Very Rev. Monsignor D. J. Kane officiated. At the conclusion of the ceremony the papal blessing was given the young couple.

The bride, who was given in marriage by her uncle, Dr. R. A. Gaughan, wore a Renaissance period gown of heavy antique satin, made on princess lines, with an heirloom rosepoint veil, and a long train. Her bouquet was of white orchids and stephanotis.

Miss Frances Smith, cousin of the bride, was maid of honor, and the bridesmaids were Mrs. Lewis Bradley Harder, sister of the bridegroom, Misses Anne Murray of New York, Joan Hurley of Boston, Mrs. George Hoffman of Albany, and Miss Cornelia Krause of Hazleton. They wore gowns of cafe au lait marquisette, with full skirts, and bodices of Chantilly lace. Their headdresses were halos of hair lace, the same color as the gowns, with bows of soft grosgrain, and they carried bouquets of African daisies.

Lt. James Butler, A. A. F. of New York City, was best man, and the ushers were Lt. Lewis Bradley Harder, U. S. N. R., brother-in-law of the bridegroom, Albert H. Marckwald, Jr., Raymond Dyer Connor, Stuart A. MacGuire, and Robert MacGowan Smith, cousin of the bride.

Sergeant Robert Molino of the Navy Air Corps, presented an organ recital before the ceremony. Visiting priests seated in the sanctuary were Rev. Edward J. Dalton, chaplain at Mt. St. Mary's Rev. Cornelius McHugh of Mt. Pocono; Rev. J. J. Curran, of Bedford Hills, N. Y., and Rev. T. C. Monahan of Montrose.

The church was decorated with cybotium fern, palms, Easter lilies and white snapdragons.

Following the ceremony, a reception was held at the Hotel Altamont, where the bridal tables were decorated with ivy, bouvardia and gardenias. The couple left to spend a honeymoon at Sea Island, Georgia, and will be at home in Bedford Hills, N. Y., after July 1st. For traveling, Mrs. Butler wore a poudre blue ensemble.

The bride was graduated from Mt. St. Mary's Academy and attended Manhattanville College of the Sacred Heart and Duchesne Residence School, New York.

The bridegroom was graduated from the Canterbury School and attended Leicester Junior College before enlisting in the U. S. Naval Reserve, from which he received an honorable discharge. He is a member of the editorial staff of Westchester Co. Publishers, Inc., at White Plains, N. Y.

Wilkes-Barre guests at the wedding included Dr. and Mrs. Lawrence Sheridan and daughter, Mayor and Mrs. Con McCole, Dr. and Mrs. Walter McGuigan, Misses Jule, Gertrude and Alice Conlon, Judge M. F. McDonald, Mr. and Mrs. M. F. Reilly, Mrs. Lawrence Finn, Mrs. Charles Gallagher, Dr. and Mrs. Peter Mayock and daughter. The Scranton guests were Mr. and Mrs. John Bonner, Mrs. J. Ward.

National Aims For Volume

NEW YORK, July 8.—(AP.)—Frank L. Kellogg, recently elected chairman of National Department Stores, painted a grim picture today of the chain's operations before the new management that he heads took over.

Kellogg became chairman May 15 and presided at the annual stockholders' meeting yesterday. In the first four months of the chain's fiscal year beginning Feb. 1, he said, losses were running 15 per cent greater than in the same period of 1954, although sales were slightly higher.

Of the 17 stores in the National chain, said Kellogg, only seven showed sales increases between Feb. 1 and May 31, and the other ten failed to match their year-ago performance. Only three finished out of the red, he added.

May Sell Stores

Kellogg told stockholders that National must "secure for ourselves a greater share of the retail business in each city or community where we operate . . . your new management intends to strengthen our organization . . . (and) train our buyers to do a better job." Stores that fail to show definite promise may be sold, he said.

At a directors' meeting after the stockholders' session, Kellogg was elected to the additional post of president, succeeding Harry H. Schwartz. Lewis B. Harder, president of South American Gold & Platinum Co., was elected to the newly created post of financial vice president and George Lehrman was named secretary and treasurer.

Pass Dividend

South American Gold & Platinum recently acquired control of National.

Directors took no action on the common stock dividend usually declared at this time. The company had previously paid 25 cents at quarterly intervals. Kellogg said the company had not earned its dividends in 1953 and operated at a loss last year.

National Department Stores units here include Frank & Seder of Pittsburgh Inc., and Rosenbaum Co here

MUNCIE STAR, SUNDAY, SEPTEMBER 18, 1955

West Hemisphere Business Leaders Meeting Monday

By HARRY W. FRANTZ

Washington (U.P.)—Business leaders from North and South America will meet here Monday to decide whether to set up a permanent organization to encourage investment in Latin American economic development.

They were invited to participate in a meeting of the policy committee of the Interamerican Investment Conference which met at New Orleans last spring to promote progress in Latin America through increased investment of private capital. More than 800 businessmen from all parts of the western hemisphere attended that session and agreed that a permanent organization was feasible.

Primary labor of the New Orleans meeting was to publicize investment opportunities in nations to the south. Three hundred specific projects—and several hundred less definite—were suggested.

Committee Members

The policy committee is headed by Rudolph S. Hecht, chairman of the board of International House in New Orleans. Its other members are Edgar G. Baker, managing director of Time-Life International, New York, and Eric Johnston, chairman of the International Development Advisory Board.

The meeting will be non-controversial. The general purpose will be to further the objectives discussed at New Orleans. These included establishment of an investment opportunities clearing house in New Orleans, sources of possible financing, co-operation of other business organizations, and means of improving the investment climate in countries which need and want foreign capital.

Administration officials will not be on hand except by special invitation. Sessions will be held at headquarters of the Chamber of Commerce of the United States.

Accept Invitations

Among those who have accepted invitations are:

A. Boyd Campbell, president of the United States Chamber of Commerce.

Robert H. Craft, vice president, Investment Bankers Association of America, New York.

Hugh A. Davies, general director, Latin American operations, International Harvester Export Co., Chicago.

Henry W. Drath, vice president, Bank of America, San Francisco.

Harvey S. Firestone Jr., chairman, the Firestone Tire and Rubber Co., Akron.

J. Peter Grace Jr., president, W. R. Grace & Co., New York.

Lewis B. Harder, president and director, South American Gold & Platinum Co., New York.

Henry R. Luce, editor-in-chief, Time, Inc., New York.

H. C. McClellan, chairman of the board, National Association of Manufacturers, New York.

Jose B. Gelbard, president Confederacion General Economica De La Republica Argentina, Buenos Aires.

Manuel Granier, vice president, Camara Nacional De Industrias, La Paz, Bolivia.

Dr. Herbert Levy, president, Banco De America, Sao Paulo, Brazil.

Luis Roberto Vidigal, President Federacao Do Comercio Estado De Sao Paulo, Sao Paulo.

Dr. Genero Payan, Genero Payan Y Cia, Bogota, Colombia.

Jose M. Bosch, president, Cia Ron Bacardi S.A., Santiago De Cuba.

Burke O. Hedges, Asociacion Nacional De Industriales De Cuba, Havana.

Luis Legorreta, Banco Nacional De Mexico, Mexico City.

Eugenio Mendoza, Eugenion Mendoza Y Cia, Caracas, Venezuela.

Eduardo Montealegre, Manager, Banco Nicaraguense, Managua, Nicaragua.

Dr. Martin Del Corrall, president Banco De Bogota, Bogota.

Manuel Da Costa Sousa, president of Conference of Industries, Sao Paulo.

Potato chips account for about 12 per cent of the potato crop sold for food.

COLOMBIA

Foreign Investment Need Told by Bogota Lawyer

A top Colombian business leader called United States' assistance to Latin America since World War II "short and much talked about."

Genaro Payan, corporation lawyear for Colombian and American firms, opened yesterday afternoon's panel on "The Role of U.S. Industry" with a plea for more foreign investment in his nation.

Payan stated that "the very fact that Colombia has not received more gifts is a source of pride and, of course, all to the good."

But, he added, "of United States' government credits granted abroad, though these have increased considerably in the past three years, Colombia has not known how to request nor has it been granted a large share."

No Unusual Problems

The Bogota attorney praised the overall conduct of American business operations in his country thus far, but declared that great new private funds must flow into Colombia if its full potential as a Western Hemisphere partner is to be fulfilled.

Payan noted that "outside of monetary exchange difficulties with which he (the American businessman) must cope . . . there are no outstandingly unusual problems for U.S. businessmen in Colombia.

"Adverse nationalism is practically nonexistent.

"In a way, Colombia has been fortunate in coming tardily into the picture of international industry and in having had its first experiences with the best of United States' firms without the concept of colonialism," he said.

The speaker observed that Colombia's traditional leading class "in general . . . do not know how the United States businessman well enough and he, in turn, has not had time to meet them yet."

"The fact that Colombia is economically part of the hemisphere and that its problems and projections are to be tackled hemispherically is barely dawning to all except a few," Payan said.

The Colombian leader stated his nation's leadership group, politically and economically, "are broadening their base on a rapidly growing urban middle class."

"They have made the country what it is today without foreign business partners or assistance such as the United States once received from Europe," Payan said.

Rape Tax Policy

Lewis Harder, president of the South American Gold & Platinum Co., launched an attack upon American corporation taxes on earnings made in Colombia and other foreign nations.

"If we continue to tax this way," charged Harder, "we won't be the financial leader in the Western Hemisphere, which is necessary to keep Latin America strong and save our own world position."

Harder joined Payan and other members of the panel in a plea for more capital investment by U.S. firms and individuals in the future potential of Colombia.

Harder declared "we (the United States) must drop these taxes. There's going to be a big fight in Congress during the next two years, but I believe the issue will be won."

If that occurs, the executive predicted that "both private and corporate money will flow down to South America."

Harder foresaw a flight of foreign-based American firms, including his own, to reincorporate in Canada if United States corporate taxes upon them were not liquidated.

"We may shift our entire corporate structure to Canada, which has no similar taxation," he said. "We don't want to do it, because it would be bad for the United States."

Prof. Surrey Counters

Harder's criticism was countered by Stanley Surrey, professor of taxation at Harvard Law School, who stated that foreign-based firms already are favored by the Federal revenue system.

"While corporations here in the United States are taxed 52 percent on earnings," said Surrey, "companies abroad were only taxed 40 to 45 percent. In addition, other concessions have been made."

Prof. Surrey called the "talk of double-taxation simply a roadblock to intelligent thinking about the other obstacles to foreign investment."

Harder's thesis was backed up by C. Boice Nourse, chairman of the Colombian panel and vice president of the First National City Bank of New York in charge of the western group of the Caribbean District.

"We don't believe that such taxation is the dominating factor in slowing down investment flow to Colombia. But liquidating these taxes would be a contribution similiar to what we've been asking of the Colombians," said Nourse.

Latin American Conference Opens at Harvard Tomorrow

Prominent businessmen from all parts of the country will assemble tomorrow at the Harvard Graduate School of Business Administration for a significant three-day conference on "Latin-American Development and United States Industry." The meeting is sponsored by the Business School in cooperation with the Boston Globe.

The purpose of the conference is "to identify and evaluate major trends which will influence the economies of certain Latin-American countries during the next five to ten years, and their implications for the United States business community."

Five countries have been selected for special study at conference sessions: Argentina, Brazil, Colombia, Mexico and Venezuela. These five were chosen as the result of a survey conducted several months ago among American business leaders to determine which Latin-American countries they considered of the greatest current interest.

★ ★ ★

While discussions will center around these five republics, the conference will deal with problems that are common to all Latin-American nations.

Keynote speakers at general sessions of the conference will be Roy R. Rubottom Jr., Assistant Secretary of State for Inter-American Affairs; J. Peter Grace, president of W. R. Grace & Co., and Galo Plaza, former President of Ecuador.

Each day of the conference five panel discussion meetings will be held simultaneously, each dealing with the development of one of the five countries selected for special study. A distinguished group of panelists at these sessions will analyze economic trends and discuss possibilities for investment and trade.

Chairmen of Panels

Chairmen of the panels will be the following:

Argentina—R. de F. Boomer, director of South American Subsidiaries and of Lone Star Cement Corp.

Brazil—H. W. Balgooyen, executive vice-president of American & Foreign Power Co.

Colombia — C. Boice Nourse, vice-president of First National City Bank of New York.

Mexico—Dr. John Fayerweather, assistant professor of business administration, Harvard Business School.

Venezuela—Walter J. Donnelly, special representative of the United States Steel Corp. to the American Republics.

Participating as panelists will be leading businessmen, financiers, educators, and government officials from Latin American nations and the United States.

Gordon Heads Conference

Opening session of the conference will take place at the Business School at 1:30 tomorrow afternoon, when President Nathan M. Pusey of Harvard and Dean Stanley F. Teele of the Business School will welcome the gathering of businessmen. Lincoln Gordon, William Ziegler, professor of international economic relations at the Business School, who is the director of the conference, will also speak.

The first panel discussion session will be held from 2:30 to 5 p.m. tomorrow. This will be followed at 7 p.m. by a banquet in the Hotel Sheraton-Plaza, at which J. Peter Grace and Ex-President Galo Plaza will be the speakers.

On Tuesday there will be panel discussion sessions at 9:30 a.m.

PROF. LINCOLN GORDON
Conference Director

and 2 p.m. A luncheon meeting will be held at 12:30 in Kresge Dining Hall at the Business School.

The final panel discussion will take place Wednesday morning at 9:30 and the conference will conclude with a luncheon at the Sheraton-Plaza at 1:30. Assistant Secretary of State Rubottom will be the principal speaker.

Welcome Businessmen to Harvard

PRES. NATHAN M. PUSEY

DEAN STANLEY F. TEELE

Conference Program

MONDAY, SEPT. 9

A. M.—Registration: Hotel Statler and Hotel Sheraton-Plaza, main lobby.

1:30—Plenary Session. Welcome by President Pusey and Dean Teele. Introduction to conference by Prof. Gordon.

2:30-5:30—First Panel Sessions. "The Challenge of Balanced Growth." (The agenda for each of the five countries to be discussed will be the same, except for minor variations).

Analysis of the basic developmental problems facing the country, including: the broad lines of development since World War II; the probable direction of growth over the next 5-10 years; and the major bottlenecks which may be encountered. Problems to be considered include: agricultural vs. industrial expansion; production for export vs internal consumption; regional imbalance; fuel, power and transportation availabilities; human resources; and the needs for social and economic overhead.

7:00—Banquet, Hotel Sheraton-Plaza. Speakers: J. Peter Grace and Galo Plaza.

TUESDAY, SEPT. 10

9:30-12:30—Second Panel Sessions —"Financing Economic Development"

Analysis of the local currency and foreign exchange required to finance economic development. Problems to be considered include: mobilization of domestic savings and their most effective allocations; control of domestic inflation; foreign exchange needed for capital goods and raw materials; and monetary, fiscal and exchange policies.

12:30—Lunch, Kresge Dining Hall, Harvard Business School

2:00-5:00—Third Panel Sessions— "The Role of U.S. Industry"

Appraisal of the experience of and the opportunities for United States trade and investment, including the trends in the country's trade with the U.S. and the limitations imposed by the balance of payments position; the tendency to replace imports with domestic manufactures, and opportunities created thereby; the investment climate; and some of the principal operating problems in the country.

WEDNESDAY, SEPT. 11

9:30-12:30—Fourth Panel Sessions —"Future Prospects"

Continuation of discussion from the Third Sessions; evaluation of future prospects; summary and recapitulation.

1:15—Luncheon, Hotel Sheraton-Plaza. Speaker, Roy R. Rubottom Jr.

45 Experts to Take Part in Panel Meetings

Forty-five noted authorities on Latin America will take part in panel discussions planned for the Harvard conference. Among them are leading industrialists, financiers and educators from Latin American republics and from the United States. The complete list of participants in the five discussion groups, each dealing with a particular Latin American nation, follows:

★ ★ ★

Argentina

CHAIRMAN

Robert de Forest Boomer, a founding director of Vision and its Portuguese-language affiliate Visao, published in Brazil, and a co-founder of the Inter-American Council of Commerce and Production. Currently he is a member of the board of directors of the Argentine American Chamber of Commerce and the Pan American Society of the United States; chairman for the United States of the Bilateral Investment Commission of Brazil and a member of a similar commission for the Argentine; and a director of the foreign subsidiary companies of the Lone Star Cement Corp.

PANELISTS

Rodolfo Kats, economist; publisher of "Economic Review".

Raul Lamuraglia, industrialist; director, Central Bank.

Arnaldo Massone, president, Instituto Massone S.A., honorary president the Argentine Chamber of Commerce.

Eustaquio Mendez Delfino, president of Buenos Aires Stock Exchange.

H. A. Arnold, president, Olin-Mathieson International Corp.

Latimer Gray, senior vice president, First National Bank of Boston.

A. O. Stanley, editor, "International Markets", Dun's Review and Modern Industry.

Leo Welch, vice president, Standard Oil Company (New Jersey).

Brazil

CHAIRMAN

Henry W. Balgooyen, executive vice president of American & Foreign Power Co. He is a director of the Pernambuco Tramways & Power Co., Ltd., North Mexico Power & Development Co., Ltd., the Telephone Co. of Pernambuco Ltd., the South Brazil Electric Co., Ltd., and the Brazilian Power Co. He is also a director of the United States Interamerican Council and the National Foreign Trade Council.

PANELISTS

Jose Garrido Torres, editor, Conjuntura Economica.

Trajano Pupo Netto, manager, Sao Paulo branch, First National City Bank of New York.

Luis Roberto Vidigal, industrialist.

Cladence Dauphinot, director-president, Deltec S. A.; chairman of the board, the Deltec Corp.

Stacy May, executive, International Basic Economy Corp.

Jacob Viner, professor of economics, Princeton University.

Colombia

CHAIRMAN

C. BOICE NOURSE, vice president of the First National City Bank of New York in charge of the Western Group of the Caribbean District. He began his career with the National City Bank in 1920. Until April 1954 he had extensive experience in Latin America, in Argentina and Uruguay, and as manager of the Mexico City Branch, and resident vice president in charge of Colombian and Cuban branches. In 1954 he was transferred to Head Office as assistant to the Manager of the Overseas Division.

PANELISTS

Carlos Echavarria, president, Compagnia Colombiana de Tijidos S.A.

Guillermo Herrera, director, Caja Agraria, Andes Bank, Andina Brewery, and other companies.

Genaro Payan, attorney.

Guillermo Restrepo, executive, Gaseosas Colombianas.

Lewis Harder, president, South American Gold & Platinum Co.

Francis Kurtz, consultant; formerly chairman of the board of American Coffee Corporation.

Robert Merrill, vice president, American Cable & Radio Corporation.

Myron Reed, executive vice president, American & Foreign Power Company.

Mexico

CHAIRMAN

John F. Fayerweather, assistant professor at the Harvard Business School, where he is responsible for courses in international business administration, including development of a new course in management of foreign operations. He has been involved in two major research projects; a study of mine management in Mexico and Canada; and currently, a study of management relationships between United States and Mexican executives. He is chairman of the American Marketing Association Committee for Teaching Foreign Marketing.

PANELISTS

Raul Martinez Ostos, subdirector, Nacional Financiera.

Edgardo Reyes Salcido, director, Department of Industrial Relations, Monterrey Technical Institute.

Gustavo Romero Kolbeck, deputy director, Investments Commission, executive office of the president.

Eduardo Prieto Lopez, vice president, Cananea Consolidated Copper Co.

Gen William H. Draper Jr., chairman of the board, Mexican Power & Light Co., Ltd.

James Maddox, American Universities field staff.

Charles Meyers, vice president for Latin America, Sears, Roebuck & Co.

Alexander Nimick, research director, Vision, Inc.

Venezuela

CHAIRMAN

Walter J. Donnelly, special representative of the United States Steel Corp. to the American Republics since 1953. He joined the Bureau of Foreign and Domestic Commerce in 1923 and held posts in Colombia, Cuba, Brazil, Panama and Peru. In 1947 he was U.S. Ambassador to Costa Rica, and from 1947 until 1950 was U.S. Ambassador to Venezuela. He was U.S. High Commissioner and Ambassador to the Republic of Austria from 1950 to 1952, and U.S. High Commissioner to the Republic of Germany during 1952.

PANELISTS

William Coles, businessman and lawyer.

Alfredo Machado, director, Banco Nacional de Descuento, General Tire of Venezuela, and other companies.

Carlos Mendoza, lawyer, economist, former president of Banco Central de Venezuela.

William H. Phelps Jr., vice president C. A. Sindicato Phelps.

John Rivera, resident vice president in Venezuela, First National City Bank of New York.

Robert Dolph, manager, Petroleum Economics Department, Creole Petroleum Corp.

Joseph Foss, businessman and financier.

Arrigo Righi, managing director for Venezuelan Pan American World Airways.

Gold—Where Are The Dividends?

A financier who has a big stake in Baltimore enterprise had chance to yesterday answer for the bright future of a gold mining company which he also heads. Gold stocks have been moving up as the rest of the market has floundered lately, gold companies see a chance to make more money in coming months and benefit hugely by dollar devaluation, should it ever come.

Lewis B. Harder is president of the South American Gold and Platinum Company. He also is chairman of the International Mining Corporation, the parent concern, which in turn controls the Canton Company of Baltimore, real estate and railroading.

These companies also are deeply interested in the Pittsburg and West Virginia Railroad, an important link in some of the maneuvering which will enable the Norfolk and Western to accomplish its proposed merger plan and form a vaster system to the West.

At South American's annual meeting, Mr. Harder told stockholders earnings may exceed $1.50 per share this year from mining operations. Last year's profit was $2.05, but mostly from capital gains.

The company benefited by Canada's devaluation of its dollar, and now gets $39 per ounce for gold there in contrast to the fixed $35 from the United States.

Mr. Harder estimated 50 cents earnings from South American, $1 from International and something extra from Pato Consolidater Gold Dredging, Ltd.

Shareholders were restive about the current 25-cent dividend. They want more, they said.

"We'll take a look," said Mr. Harder. "I'm as interested as you are. We'll treat you well."

* * *

Bob Kriendler of the Twenty-One clan hosted a luncheon for Jack Campbell, who served under him as a lieutenant in the marines when Bob was then a major.

Kriendler is now a full colonel in the marine reserves, but Campbell has also stepped up — he is the governor of New Mexico.

Among those who attended the luncheon were New Mexico's Sen. Clinton P. Anderson, former Ambassador to Switzerland Robert McKinney, Lewis Harder of the Molybdenum Company, Magazine Publisher Gordon Fawcett, Commissioner Richard J. Patterson, jr., — some two dozen others.

Incidentally, as we itemed some weeks ago, Gov. Campbell appointed Kriendler, his former superior officer, a colonel on his staff.

Questa Molybdenum Mine, Mill Dedication Program Conducted

QUESTA (UPI)— Dignitaries and newsmen attended dedication ceremonies of the Molybdenum Corp. of America's expanded mine and mill at Questa today and then toured the $40 million property.

Some 400 guests were invited to the ceremony, with over half of them being from outside of New Mexico. Gov. Jack M. Campbell was to deliver a dedicatory address at 1:30 p.m.

Others speaking included Jack M. Brandenburg, president of the First State Bank of Taos; master of ceremonies George Morrison, news director at station KOAT-TV in Albuquerque; William Kuntz, of New York, president of Molycorp; and Lewis B. Harder of New York, chairman of the board of Molycorp.

Mining Men Attend

The ceremonies attracted a large group of mining officials from throughout the United States and Canada in addition to state officials, political candidates and newsmen.

The Questa mine is located about 5½ miles from the town of Questa on the western slope of the Taos Range of the Sangre de Cristo Mountains. Molycorp acquired claims to the property in 1921 and began production in 1922, building a 50-ton capacity mill in 1923.

After years of underground mining, surface drilling began in 1960. By 1964 sufficient reserves were blocked out to make the new plant and expanded operation feasible.

To Relieve Shortage

The mine-mill complex to be dedicated today represents a total investment of more than $40 million, is the site of the first large new primary source of molybdenum developed in the United States in 40 years, and will account for about 10 per cent of total free world molybdenum output and 20 per cent of the molybdenum consumed in the United States.

John Petty, vice president and general manager of Molycorp at Questa, said: "Production from the Questa mine is expected to play a significant role in relieving the shortage of molybdenum which had persisted for several years."

The Molycorp holdings near Questa consist of 14,300 acres with an additional 2,000 acres under option, and the concentrating mill has a rated capacity of 10,000 tons of ore per day. The mill was built at a cost of $20 million.

Economic Boost Seen

Molycorp Mine-Mill Dedicated at Questa

By WAYNE S. SCOTT
Of the Journal Staff

QUESTA — The new installation of Molybdenum Corporation of America is one of the things which will improve the economic conditions of northern New Mexico, Gov. Jack M. Campbell declared Friday at the formal dedication of the mine and mill seven miles east of Questa.

"Northern New Mexico has not kept pace with the economic development of the rest of the state," the governor said. "But it is a land of tremendous potential. We are participating in the culmination of one of them today."

More than 200 persons attended the open air dedication program, highlighted by a flyover of four New Mexico Air National Guard jet planes at low altitude.

Many of those attending toured the $40 million installation which will furnish 15 per cent of this country's molybdenum. The rare metal is an important ingredient of high quality steel.

Gov. Campbell and high Molycorp officials were high in praising each other for cooperation enabling construction of the plant.

Among the company officials who spoke were William R. Kuntz, president, Lewis B. Harder, chairman of the board, and John M. Petty, vice president and general manager of the Questa mine and mill. The three singled out by names more than 50 individuals, company officials and officials of state and federal agencies whom they praised for their contributions toward establishment of the plant.

Gov. Campbell pointed out northern New Mexico as one of the oldest settled areas of what is now the United States. Indian pueblos occupied the

Continued on A-10

Dedication Held Of Molybdenum Corp. Installation

Continued From A-1

area for centuries before the coming of the first Spanish conquistadores. The Spanish settlers, he said were followed by trappers, ranchers and in late years nuclear physicists.

Notes New Projects

He said a number of projects already have been completed or are in progress which will aid in further development of the area. He said the Rio Grande Gorge Bridge and the connecting US-64, which he said would be completed by early 1969, would provide a route for tourists across northern New Mexico.

He said the San Juan-Chama water project and the Navajo Dam and Navajo irrigation project would provide the area with plenty of water and further aid its development. Kaiser Corp. is now opening a new mine to produce more than one million tons of coal annually, which will aid in rehabilitating the formerly prosperous coal mining areas of northern New Mexico, Campbell said.

He predicted 1966 would be "a banner year" for mining in New Mexico. In addition to the Kaiser coal mine, he said there has been an upsurge in copper, lead and zinc mining. There are 463 mining operations in New Mexico he said, with investments totaling $44 million, in addition to the Molycorp investment.

In Public Interest

"I am pleased to report this installation will operate in complete compatibility with the public interest as affecting public health, recreation, and water supplies" Campbell said.

He referred to the report of a special committee which had studied the problem of a recent incident which caused pollution of the Red River. The report stated that steps had been taken to prevent similar incidents in the future and a system had been set up to warn everyone concerned should another incident occur.

"We are going to make it entirely possible for fishermen to fish without any fear of danger to themselves or danger to the fishing habitat," Campbell said.

He expressed appreciation to company officials for their cooperation in this respect.

Has 316 Employes

The governor said the operation, with its 316 employees and its $2.4 million annual payroll is a "magnificent addition to the economy not only of Taos County but the economy of the entire state."

"New Mexico is on the move and we are proud Molycorp is on the move with it," the governor said.

The flyover of Air National Guard jets had been scheduled to occur at the end of the governor's speech. But the program had dragged slightly and the roar of the planes interrupted the governor. But the crowd had been forewarned and the governor made frequent jokes concerning the interruption during his speech.

Extends Praise

High praise for Campbell's interest in the tourist industry was expressed by Jack P. Brandenburg, president of the first state bank of Taos. He particularly praised the governor for the construction of the Rio Grande Gorge Bridge which he called "one of the major accomplishments of Gov. Campbell during his term in office."

Brandenburg also recounted the history of Taos County. He noted that sheep raising had been its principal industry in early days, "but today it is of very little economic importance to our people."

Tourism is the county's biggest industry today, Brandenburg said.

"Red River has developed into one of the outstanding summer resorts of the Rocky Mountain area and is now becoming known as a winter resort, Brandenburg said.

Seeks New Ore

The Molycorp installation is about seven miles east of Questa on the road to Red River. The firm has been operating in a small way since 1922. It almost closed down in the early 1950's after the high grade ore veins played out. But it decided instead to seek new ores and found a large quantity of lower grade mineral which it is now mining by the open pit method. Ten thousand tons of ore are being extracted each day from the open pit. Shovels with 10 cubic yard buckets scoop up the ore and place them in 100 ton dump trucks for transportation to the mill.

Here the ore goes through several crushers and then is concentrated by a flotation process. The concentrated ore is trucked to Alamosa, Colo. and from there goes by rail to the company's refining plant in

Lewis B. Harder Is Named to Board Of Indian Head, Inc.

Indian Head, Inc., has elected Lewis B. Harder to its board of directors, increasing the number of directors to 14. The board of directors also declared a quarterly dividend of 12½c per share on the common stock, payable Jan. 5, to shareholders of record December 16, 1966.

Mr. Harder is chairman and chief executive officer of International Mining Corp., New York, which is engaged in the mining and processing of gold, platinum, silver, nonferrous metals and rare earths in South America, the United States and Canada. It also operates a large marine terminal complex in Baltimore and is a major stockholder in Brazilian Traction, Light & Power Co. Ltd., Molybdenum Corporation of America and Vanadium Corporation of America.

Indian Head operates the H. and F. Binch Co. plant in Glens Falls.

SUZY KNICKERBOCKER

Of Cartier's and Kings

George Hamilton had them all shook up when he dropped in at Cartier's on Fifth Avenue. Naturally, everyone was staring. They thought he might be on his way to the ring counter or something. It turned out he was just visiting his friend, Stephanie Wrightsman, granddaughter of oil millionaire Charles Wrightsman, who works there. Whew. . . . Consuelo and Rudy Crespi are a couple of Italians who don't have to worry about their titles while they're off photographing in India for Vogue.

Count and Countess Crespi are listed safely and soundly in the Libro D'Oro Dalla Mobilita' Italiana just hot off the press. Others who leave the Italian homeland and add a title or two to their names might check this golden book of nobility before they get too risky. For instance, the only Prince Ruspoli is Don Francesco, the only Prince Borghese is Flavio, Emilio Pucci is really the Marchesi Di Bersento and neither Christina Paolozzi (Bellin) nor her mother the former Alice Spaulding of Boston nor her father Lorenzo have titles other than Don or Donna. The title-holder in the Paolozzi family is a gentleman named Clemente. Do some people really take this seriously? You bet your bottom salami they do.

Gertrude and Harold Vanderbilt, who make their winter home in Manslapan, Fla., were honored at a small but touching ceremony there. A flag and a flagpole were dedicated to Harold who has been mayor (he appointed himself) of Manslapan since the little community began. He made a little speech — heart-warming. Gertrude was presented with a gold medal for being such a charming First Lady through the years. Harold, a noted yachtsman and championship bridge player is a brother of the late Mme. Jacques Belsen, who as Consuelo Vanderbilt married the Duke of Marlborough to satisfy the demands of her aggressive, ambitious mother Mrs. O. H. P. Belmont. Harold summers in Newport. It's only natural. . . .

The Welton Becketts are getting a divorce. He designed the magnificent new music center in Los Angeles—and the Beckett family lean-to in Holmby Hills, the exclusive suburb, is just about as impressive. However, all poor Mrs. Beckett gets to see of lately is the garden. "The only right I have at the moment," she says, "is to go over and pick flowers." Not to worry. Paul Caruso is her lawyer, so she's got to end up with more than all the posies she can pluck at one plucking . . . Asia Mellon Bruce, probably the richest American woman, is taking her three Currier grandchildren to Palm Beach for Easter. Mrs. Bruce is still in deep mourning over the recent loss of her daughter and son-in-law, Audry and Stephen Currier, in a private plane in the Caribbean. According to the Currier's will, John Simons, a former teacher at Yale, and Mrs. Simons were named guardians of the children. Simons and his wife have taken an apartment in the new building going up on the site of the old Brokaw Townhouse on Fifth Avenue, where the children will live. The Curriers left half a million dollars to the Simonses for their interest and help . . . Mrs. Cortwright (Tootie) Wetherill no sooner arrived from Paris with her mother, Mrs. P. A. B. Widener of the phirst phamilies of Philadelphia, than she was off again with her husband and two sons for San Juan, Puerto Rico, and St. Thomas, Virgin Islands, until a few days after Easter . . . The Francis Kelloggs are going to Antigua to be houseguests of industrialist Lewis Harder and Mrs. Harder at the Mill Reef Club. A terribly in-enclave. Also off to Antigua with her son is Mrs. Mary Biddle Flagg . . . Walter Chrysler and his attractive wife Joan bought an apartment in New York and will spend more time here. They've been practically year-round residents of Provincetown, Mass., where Walter, an art authority, has done so much for the museum. His money comes from the automobile fortune, but you know that . . .

B.C.'s intended partner is giant billion-dollar corporation

The company with which the provincial government plans to go into partnership in developing the Sukunka coal field is an international corporation with assets in the billion-dollar range.

Brascan Ltd., a holding company, is the direct owner of shares in a string of Brazilian companies and is also associated with the largest private firm in Brazil, which supplies electricity to the two largest cities in the country.

In Canada, Brascan's chief investment is in John Labatt Ltd., a producer of beer, food and other products. It also holds a 6.7-per-cent interest in the Hudson's Bay Co., the department store chain.

Brascan had 1971 assets of $1.1 billion and net income of $83.7 million or $3.60 a share. It trades on the Toronto Stock Exchange at $19.75 to $20⅛.

Premier Dave Barrett announced Monday that the provincial government has agreed to purchase a 40-per-cent interest in the Sukunka coal project from Brameda Resources Ltd.

The deal is subject to Brascan exercising options to acquire the other 60 per cent and putting the coalfield into production by mid-1975.

Vancouver-based Brameda Resources Ltd. discovered the Sukunka coal deposit in 1970 and owns the 41 coal licences that form the deposit.

Brameda was formed in 1969 through the consolidation of the "Brynelsen" group of companies and was converted from a private to a public company that year.

The name Brameda was taken from letters in the last names of the four founders, B. O. Brynelsen, Jacob Austin, Morris Menzies and Merv Davis.

Brameda essentially was a holding company, controlling a group of other mining companies.

In 1969 Brameda acquired a 50.03-per-cent interest in Vancouver-based Churchill Copper Corporation Ltd., a company which had a small copper mine near Fort Nelson, B.C.

In October 1971, Churchill Copper closed down in view of depressed prices for copper.

In 1972 Churchill shares were suspended from trading on the Vancouver Stock Exchange and last January the company was delisted for failure to maintain listing requirements.

Brameda can also acquire a 70-per-cent interest in Silver Mines Ltd., a copper-molybdenum prospect in the Yukon.

In 1971 Brameda had a net loss, including extraordinary items, of $15.5 million. Its assets were listed as $10.5 million.

In June 1970, Teck Corporation Ltd. poured $3 million into Brameda's treasury to provide it with working capital.

In November of that year Teck and Brameda entered into an agreement in which Teck purchased a five-per-cent interest in Sukunka for $1 million.

By mid-1971, Brameda was still considering placing the Sukunka project into production on its own. Brameda chairman Brynelsen said that Sukunka could be operational by late 1973.

A few weeks later Brameda and Teck announced they had worked out a development agreement with a wholly-owned subsidiary of Toronto-based Brascan Ltd., Mikas Oil Co. Ltd. of Calgary.

Under the agreement, Mikas was able to earn a 7.5 per-cent interest in the Sukunka property for an outlay of $1.5 million to be spent on drilling, underground work and feasibility study. Mikas also had the option to earn an additional 37.5-per-cent interest for spending $7.5 million.

Under this agreement, Brameda would have retained a 50-per-cent interest in Sukunka, with Mikas holding 42.5-per-cent interest and Coalition Mining Ltd. a 7.5-per-cent interest.

Coalition is a private company whose shareholders are Mikas, Austen & Butta Ltd. (Australian coal operators) and Intercontinental Fuels Ltd. (British coal company with worldwide experience in the marketing of coal).

A vice-president of Coalition is Cliff Sawyer, who joined Brascan in 1969.

Before joining Brascan, Sawyer was for many years associated with the Ford Motor Comapny and had a variety of management assignments in Canada, the U.S., Europe and Latin America.

Last October Brameda announced it had granted the Brascan group the option to purchase an additional 10 per cent in Sukunka, thereby reducing its holdings to 40 per cent and increasing those of the Brascan group to 60 per cent. This extra 10-per-cent interest was to cost an additional $2.15 million.

It is Brameda's 40 per cent the government intends to purchase.

The option agreement, the date of which Brascan was to have made a production decision on Sukunka, expired Jan. 31 but was extended to June 1975.

Brameda cited a variety of reasons, including the location of the loading port, development mining and market research, for the extension on the option agreement.

The 1971 Brascan annual report lists the following as directors of the company:

J. Abs Hermann, chairman, Deutsche Bank AG, Germany; J. H. A'Court, vice-president, finance, Toronto; Pierre Ansiaux, member of the Supreme Court of Belgium, Brussels; A. T. A. Antunes, president, Industria e Comercio de Minerios S.A., Rio de Janeiro; Thierry Barbey, managing partner, Lombard, Odier & Cie, Geneva; Henry Borden, director and member of the executive committee, Bell Canada, Toronto; Paul Desmarais, chairman, Power Corporation of Canada, Ltd., Montreal;

John F. Gallagher, vice-president, international operations, Sears, Roebuck and Co., Chicago; Antonio Gallotti, vice-president, a president of Servicos de Eletricdade S.A., Rio de Janeiro; J. Peter Grace, chairman, W. R. Grace & Co., New York; Lewis Harder, chairman, International Mining Corporation, New York; N. E. Hardy, president, John Labatt Ltd., London, Ont.; W. C. Harris, chairman, Harris & Partners Ltd., Toronto; Louis Lapointe, chairman and president, Miron Company Ltd., Montreal.

A. J. MacIntosh, partner, Blake, Cassels & Graydon, Toronto; Paul Manheim, limited partner, Lehman Brothers, New York; William Manning, partner, Simpson Thacher & Bartlett, New York; Beverley Matthews, partner, McCarthy & McCarthy, Toronto; Neil McKinnon, chairman, Canadian Imperial Bank of Commerce, Toronto; William Meese, president and chief executive officer, the Detroit Edison Company; Detroit; J. H. Moore, president, London, Ont.; John Phillimore, managing director, Baring Brothers & Co. Ltd., London.

Directors of Teck Corporation Limited are: B. O. Brynelsen, president, Brenda Mines Limited, Vancouver; Sir Michael Butler, Barrister, Farris, Baughan, Wills & Murphy, Vancouver; R. E. Hallbauer, president, Brameda Resources Ltd., Vancouver; William James, director, Canada Permanent Mortage Corporation, Toronto; A. R. Keevil, vice-president, Teck, Calgary; N. B. Keevil, president, Copperfields Mining Corporation Ltd., Mississauga, Ont.; N. B. Keevil Jr., president, Tribag Mining Limited, Vancouver. J. D. Leishman, director, Mutual Life Assurance Company of Canada, Vanouver; C. E. Michener, consulting geologist, Toronto; H. H. Westell, executive vice-president, Teck, Islington, Ont.; R. J. Wright, partner, Lang, Michener, Cranston, Farquharson & Wright, Toronto.

The 1971 annual report of Brameda lists the following as directors:

William Bergey, exploration manager, Keevil Mining Group, Vanououver; Bernard O. Brynelsen, president, Brenda Mines Ltd., Vancouver; Sir Michael Butler, barrister, Vancouver; Mervin E. Davis, vice-president, Brenda Mines, Vancouver; Robert W. Falkins, president, Highmont Mining Corp. Ltd., Vancouver; Robert Hallbauer, vice-president, Teck; Norman Keevil Jr., executive vice-president, Teck; John Leishman, director, Teck, Vancouver; Morris Menzies, director, Brenda Mines, Vancouver; Joseph Murphy, general manager, Burns Bros. & Denton Ltd., Toronto; Ridgeway Wilson, president, Silver Standard Mines Ltd., Vancouver.

Rock Island railroad's future riding on truth of Ingram's reputation

1974-10-20-chicago-tribune-pg-63-clip-rock-island-rr-future

By Leonard Wiener

A RECENT report by the United States Department of Transportation said the Chicago, Rock Island & Pacific Railroad had one of the highest derailment rates in the country.

John W. Ingram, federal railroad administrator, said the industry-wide report should help identify railroads that have to pay special attention to maintenance and also will show government inspectors where to concentrate their efforts.

In two weeks, Ingram will be on the other side of the fence.

Last week, Ingram was named president and chief executive officer of the Rock Island, a struggling Chicago-based railroad that has been trying to consummate a marriage into wealth for more than 11 years.

With mounting losses, deteriorating tracks and equipment, and the outlook for a merger in as much doubt as ever, something obviously had to be done. The railroad's directors, many of whom are also major stockholders, apparently decided a change was needed in top management.

LOSERS in the management shuffle were:

● Theodore E. Desch, the 43-year-old chairman and chief executive who has been with the line since 1956, when he joined the legal department. He became chief executive officer in 1970 but couldn't reverse financial losses or obtain an elusive merger with the Union Pacific Railroad that got increasingly complex and bogged down in government red tape. Desch will remain a director and "consultant," but he acknowledged the obvious to The Tribune: "I'm looking for a job."

● William J. Dixon, the 56-year-old president and civil engineer who joined the line in 1965 as assistant to the president after serving as general manager-industrial engineering at the Chesapeake & Ohio-Baltimore & Ohio Railroad. He became president in 1970. The announcement shakeup didn't even mention him, altho a new president was named.

A power behind the realignment was Lewis Bradley Harder, a 56-year-old mining executive who watches over various financial activities as well as international interests in gold, copper, platinum, silver, and other metals from the New York City offices of International Mining Corp., of which he is chairman and chief executive.

INTERNATIONAL MINING owns 244,500 shares of Rock Island stock and Harder and his wife control another 149,000.

Harder, a former partner in the Harris, Upham & Co. brokerage firm and part-time resident of Antigua, said he got involved with Rock Island about two years ago because it appeared that a merger with the Union Pacific was very close.

Now, with directors perhaps fearing that the Rock Island may collapse before it can be rescued, Harder said they decided to revamp the company and make an all-out effort to make it viable —with or without a merger. However, Harder emphasized that a merger is still the goal.

Harder, a director since late last year, was named chairman of the board, a position he said will not carry a salary.

HE SAID THE Rock Island will have to toughen up and tighten up if it expects to get needed infusions of new capital—from the government and possibly elsewhere.

He said there were no ill feelings toward Desch but that a "railroad man not a lawyer" was needed to run the company. Harder also said he was enthusiastic about Ingram's marketing reputation.

Ingram, a vice president of the Illinois Central Railroad before taking the federal post in 1971, will return to Chicago with his wife, Mimi, and two dogs —a 2-year-old bloodhound, Bubbles, and a 12-year-old beagle, Socrates.

He'll double his current $40,000 salary but he'll still be making less than he did at the Illinois Central. "But what a challenge," he said.

Ingram has a reputation—but whether it's good or bad depends on to whom you talk.

"HE'S antagonized some railroad men because he tells it like it is," an Ingram associate said. "If a railroad's track ties are beginning to rot he'll say just that, not that the railroad is mature. He's a bulldog who will sink his teeth into a situation."

Another railroad industry source, however, warned of Ingram's "abrasiveness."

Some in the industry complain that he failed to "represent" the rail industry as federal railroad administrator and "did little for the railroads." Especially annoying to some are what they call the exaggerated and misleading publicity over derailments.

Without being willing to pin the failings of the Rock Island solely on past management, others in the industry, however, wonder whether a "hard-nosed guy" is what the Rock Island needs.

THEY AGREE that the Rock Island does have strengths that could perhaps be better exploited—such as routes that include important traffic points such as Chicago, the Quad-Cities, Omaha, and Denver.

"They've had some good ideas and good service and they're not completely falling apart. But other railroads competing with them often seem to be able to go them one better," said one industry source.

Scott has new directors

Scott Paper Company, with a plant in Fort Edward, has announced the election of four directors, increasing the size of its board to 20 directors.

Three of those elected are officers of Brascan Limited of Toronto, Ontario. They are Peter F Bronfman, chairman; J Trevor Eyton, president and chief executive officer and Jack L Cockwell, executive vice president.

The fourth director is Lewis B Harder, chairman and president of International Mining Corporation in New York and a director of Brascan Limited.

C&C plans new name

☐ It's asking stockholders to rename it Dole Food Co. Inc.

By Russ Lynch
Star-Bulletin

Castle & Cooke Inc., named after pioneer Hawaii settlers, will change its 140-year-old name to Dole Food Co. Inc., if stockholders give their expected approval at the company's July 30 annual meeting.

David H. Murdock, chairman and chief executive officer, said today that a resolution to change the name will go before stockholders when they meet at the Halekulani Hotel.

Last July, Murdock announced that the company was prepared to sell its giant Dole Food subsidiary, which was responsbile for about $2.8 billion of Castle & Cooke's 1990 revenues of slightly more than $3 billion.

His reasoning was that the food business and Castle & Cooke's much smaller real estate business would do better in the stock market as separate companies, while proceeds from the Dole sale could go into developing and marketing the company's huge land holdings.

1991-06-24-honolulu-star-bulletin-pg-c-1-clip-c-and-c

By December, however, he had taken it off the market. Changing financial market conditions had apparently resulted in no firm offers in line with what analysts said Dole was worth, about $3 billion. Three months ago, the Wall Street Journal quoted Murdock as saying that Dole would never be sold.

Since becoming chairman after leading a 1985 financial bailout of what was nearly a bankrupt company, Murdock has driven the Dole name into international prominence.

"The Dole name is known worldwide and is synonymous with the highest standards of quality and freshness. The proposed name change also reflects the widespread use of Dole as the primary identification of the company and the name used by its customers, employees and the general public," Murdock said today.

The company will continue to use the Castle & Cooke name in its California, Hawaii and Arizona real estate businesses.

Castle & Cooke management also nominated two new directors for election at next month's meeting. One is a Hawaii businessman, Frank J. Hata, chairman and chief executive officer of amajor wholesale food business, Y. Hata & Co.

The other is Richard M. Ferry, president of Korn/Ferry International Inc., an international executive search firm. They would replace two board members who are retiring, Milton R. Abrahams and Lewis B. Harder.

Housatonic

Robert Lewis Harris (born 1937)

2015 (Aug) - Passing

See [HN008A][GDrive]

At 6 feet, 7 inches, Bob Harris was easy to notice.

He always cut a dashing figure — with his signature tasseled loafers, a brocaded silk vest in summer, a crimson plaid Christmas jacket or some other elegant, attention-getting attire whenever the occasion called for it. Unless his work as an attorney for the **Landegger family's pulp and paper** concerns required his presence in Europe or another far-flung part of the globe, Bob rarely missed a weekend on Shelter Island, where he bought his house on Cartwright Road in 1976.

Robert Lewis Harris' journey ended peacefully there on June 20, 2015. He was 77. He had battled hard against leukemia for eight months.

Though he kept an apartment in the city, Bob regarded Shelter Island as home. His love of the Island manifested itself in many ways. He was a generous contributor to numerous Island institutions. Each summer, at the Mashomack dinner dance, he bid vigorously on such auction items as the lobster bake and the Christmas cocktail party. As the bids grew higher and most dropped out, Harris raised his bidding paddle again and again.

On several occasions, Bob and one other bidder dueled it out until Mike Laspia offered to do two cocktail parties or two lobster bakes. The results for both Bob's friends and Mashomack's budget were most felicitous.

Bob also frequently served at Historical Society events. He'd pour punch or make brownies or do whatever was needed to make a success of whatever event. He underwrote the production of a book about the collection of Delftware donated to theHistorical Society by the late Gill Patterson. Then, in the last weeks of his life, he also provided the funds to build cabinets in which the centuries-old pieces could be safely displayed.

Bob's generosity was not limited to public giving. When a friend was throwing a bash or had a birthday or needed cheering for whatever reason, Bob sent flowers — always via Becky Smith at Shelter Island Florist. He also frequently turned up with a platter of lemon squares or a casserole he'd spotted in a cooking magazine — all ingredients purchased at the IGA.

A few years ago, when the husband of an East End friend was going through the rigors of cancer treatment at Columbia-Presbyterian Hospital, Bob took the subway uptown one evening each week to take the woman out to dinner, thereby giving her a brief respite from the wear and tear of being at her husband's bedside.

He also quietly participated in clean-up events at Mashomack and took on the role of conservator for a friend who was being swirled into the mists of dementia.

For fun, he kayaked the waters of Coecles Harbor, cooked elaborate and delicious meals to serve at his kitchen table and sailed the Island's roads in a 1995 Buick Park Avenue, nicknamed "The Galleon" that was carefully restored by a skilled Island craftsman.

His city pleasures included ballet — he was a devoted balletomane and a donor to the American Ballet Theater — the Metropolitan Museum of Art and the Metropolitan Opera. At the opera, he always insisted his guests sip champagne during the intervals.

There were moments, when displeased, Bob could show flashes of asperity, scathing wit or hauteur. But he far more often displayed the playful, curious, loyal and charitable sides of his nature. **He particularly delighted in taking special guests out onto the head of one of the Chrysler building's gargoyles, to view from vertiginous height the marvels of Manhattan below and feel what it must be to be one of the flying gargoyles. Access was via his office door.**

Bob was born in the Holly Hills neighborhood of St. Louis in 1937 to **Robert Lewis and Faryl Johnson Harris**. He earned his bachelor's degree at DePauw University in 1959 and an M.A. at the University of Missouri in 1964.

After three years on Okinawa with American Express' banking division, he decided he wasn't cut out for the financial world and headed to New York. There, for several years, he joined J. Walter Thompson and the "mad men" of the advertising world as assistant treasurer. But that interest too proved fleeting. When he finally finished law school at NYU in 1970, he'd found his calling.

He joined **Black Clawson, the Landegger family worldwide pulp and paper machinery enterprise**, a few years after completing law school and remained with them until his death. He prided himself on the Rolex watch given him by Carl Landegger, the head of the firm. The watch is engraved on the back, "Thank you. Carl."

[See below ...]

He discovered Shelter Island when the late Robert Braunschweig, also an attorney and a weekend Islander, invited him here to work on a case that concerned them both. Bob looked around, liked what he saw and, a few months later, became an Islander. His parents joined him here after his father's retirement and remained Islanders themselves until their deaths.

Bob is survived by his wife, **Svetlana Kluge Harris** of New York, and his **brother, Stuart J. Harris** of Virginia Beach, Virginia.

Plans for a gathering honoring Bob's memory are incomplete.

Navy awards Va. Beach firm contract for electronic devices

The Virginian-Pilot

VIRGINIA BEACH The Navy's Space and Naval Warfare Systems Command has awarded Milcom Systems Corp. a $79 million contract for intelligence, cryptologic and electronic warfare systems.

The contract includes options that could bring the value of the contract to $456 million over the next five years.

It could also create as many as 341 new jobs in Hampton Roads, said Stuart J. Harris, Milcom's vice president for business development and marketing.

Milcom, a 30-year-old private firm, employs 1,000 people, 350 of them in its Virginia Beach headquarters. The company employs mostly electronics technicians as well as some electrical mechanical engineers. The company has annual revenues of about $90 million, 98 percent of which comes from government contracts, Harris said.

The Navy contract award is an extension of sorts of four previous contracts, although this time the Navy bundled the contracts together for competitive bidding. Milcom's bid beat two other contenders.

The job entails installing and integrating electronics and communications systems on carrier battlegroups and shore stations, Harris said.

Karl F. Landagger, a leading builder of pulp and paper mills throughout the world, died of a heart attack Friday in Eleuthera, the Bahamas. He was 70 years old and lived here and in Ridgefield, Conn.

Mr. Landegger was chairman of Parsons & Whittemore Inc., 200 Park Avenue. In 1944 Pe. acquired control of the concern, then a pulp and paper exporter, and diversified it.

Today the company produces pulp and paper in its own mills, engineers and constructs pulp, paper and Saw mills, and through a subsidiary, the Black Clawson Company, manufactures paper rnachirery, machnes for plastic processing, cementpipe making and solid waste reclamatirm systems.

In 1931 Mr. Landegger bought his first paper mill at Wets in his native Austria, for $5.000 cash and a $200.000 note. Foreseeing difficulties with Hitler, he left Austria in 1938 and went to London to work for Lyddon and Company, a pulpmerchandising conceal.

He moved here in 1940 to set up a branch for Lyddon and later gained control of Parsons 8: Whittemore, Black Clawson and Lyddon, his former employer.

In partnership with Lyddon he began to build. a mill in Portugal in 11954. From then urtil the late 1960's he specialized in building mills in underdeveloped couatries and in Europe, before turning to this continent.

Surviving are his wife, Lena; twc sons, Carl and George, and a daughter, Mon Ling Helena.

A funeral mass will be offered at 11 A.M. tomorrow in St. Ignatius Loyola Roman, Catholic Church, 980 Park Avenue.

AP, April 18, 1986, Section D, Page 19

Senator Daniel J. Evans, Republican of Washington, said his press secretary, Sally S. Heet, was found stabbed to death in her Capitol Hill apartment today.

Mr. Evans said Miss Heet, 35 years old, formerly a resident of Seattle, was "killed apparently last night in her apartment."

The Senator said he had become concerned when Miss Heet failed to meet him and a reporter for breakfast.

Miss Heet's stepbrother and a member of Mr. Evans's staff went to her apartment, where they found the body about 10:30 A.M., Mr. Evans said.

He described Miss Heet as "a close friend, lively and vivacious."

"I'll miss her forever," he said. "She had been a part of a very, very close team. The whole office is in shock."

Police officials said they had no suspects in the death.

Miss Heet joined Mr. Evans's staff as press secretary in 1983 after he took office on the death of Senator Henry Jackson. Before that, she worked as a vice president and manager of corporate communications for the Rainier National Bank. She worked earlier as an account executive for a Seattle public relations concern.

Aide to Sen. Evans of Washington murdered

Press secretary found stabbed in Capitol Hill apartment

PORTLAND OREGONIAN 4-18-86

By JAMES C. FLANIGAN
of The Oregonian staff

WASHINGTON — The press secretary to Washington Sen. Daniel J. Evans was found murdered Thursday in her Capitol Hill apartment about six blocks from her office in the Senate Hart Office Building.

Evans said at a somber press conference in his Senate office at midafternoon that Sally S. Heet, 35, was stabbed to death sometime Wednesday night after she returned home.

"We all feel very much like a family," Evans said in a trembling voice. "We will miss her forever."

Heet's body was found in the apartment by her brother, Jim Hudson, an employee of the U.S. Labor Department, and a member of Evans' staff, whom Evans did not identify, after she failed to show up for work.

"There are many joyous moments and there are sad moments, but this is one of the saddest," Evans said in recalling his meetings with the press over the years as a governor and then a senator.

The District of Columbia police are investigating the death as a homicide but have released few details. Police spokesmen indicated Heet died of multiple stab wounds.

Bill Jacobs, the senator's chief of staff and one of Heet's closest friends, went to the apartment when he was notified that her body had been found and assisted police with the investigation.

Evans was attending a Senate Foreign Relations Committee session on a proposed sale of arms to Saudi Arabia when he was notified.

Evans said that Heet was last seen when she left her office about 8:30 p.m. Wednesday. Her body was discovered about 9:30 a.m. Thursday.

"Her mailbox was open and the mail was still there; so it looks like someone met up with her at that point, but I don't want to presume," Evans said.

Evans said he had expected Heet to join him Thursday morning for a breakfast interview in the U.S. Capitol with Helen Dewar of the Washington Post.

"I was surprised when she didn't show up," he said. "She is so very prompt and probably it raised some warning signal that something was wrong."

SALLY S. HEET
Failed to show up for work

Heet was single and lived alone.

Mark Murray, press secretary to Rep. Don Bonker, a Democratic congressman from Vancouver, Wash., said he lived in an apartment on the floor below Heet's apartment.

Murray said he returned to the building about 10:30 p.m. Wednesday. "I remember when I came home that her mailbox was open." He said Heet normally drove to work even though she lived a short distance away and had a parking space in the Senate building because of her concern over crime.

Heet had been vice president and manager of corporate communications for the Rainier National Bank in Seattle before becoming Evans' press aide in December 1983.

She helped organize the Republican senator's office after he was appointed to succeed the late Sen. Henry M. Jackson after the Democratic senator's death and remained as a key member of Evans' staff after he was elected in a special election.

Heet's mother lives in Indiana. She has a sister in Seattle and another brother in Los Angeles.

Senator's press aide stabbed to death

CHICAGO SUN TIMES 4-18-86

From Sun-Times Wires

WASHINGTON—The press secretary to Sen. Daniel J. Evans (R-Wash.) was found stabbed to death yesterday in her Capitol Hill condominium several blocks from her office.

The body of Sally S. Heet, 35, was discovered by her brother, Jim Hudson, a Labor Department employee, and a member of Evans' staff. They went looking for her after she did not show up for work in the morning.

Sally S. Heet

District of Columbia police said Heet had multiple stab wounds. An autopsy will be conducted today to determine the time and exact cause of death.

Police said they were not sure when Heet, who lived on the third floor, was attacked and had no motive or suspect. The door of her first-floor mailbox was open when officers arrived at the building yesterday morning and the mail still was inside.

"It looks as if someone met up with her at that point," said Evans' administrative assistant, Bill Jacobs.

"This is one of the saddest times in my 25 years of public life," Evans, his voice cracking with emotion, told a press conference. "I'll miss her forever.

"She had been a part of a very, very close team. The whole office is in shock. We all feel we have lost a close member of the family."

Evans said police found no sign of a struggle in Heet's condominium even though there was a great deal of blood.

The senator said his press secretary last was seen by her co-workers when she left her Senate office at 8:30 p.m. Wednesday. Her car was parked on the street outside her five-story building, indicating that she drove home after work.

He said Heet's failure to meet him and a reporter for a breakfast at the Capitol "raised some warnings" because she was always "so very prompt."

Senate Aide Slain In Hill Apartment

WASHINGTON ROLL CALL 4-24-86

By Peter Durantine

"It is a sad day for this office," remarked a staffer quietly as friends and staff members from adjoining offices filtered through the office of Sen. Daniel Evans (R-Wash) last Friday. They were there to offer condolences and support to the staff in their period of grief. Sally Heet, the Senator's popular press secretary, was brutally murdered last week in her Northeast apartment a few blocks from the Senator's office.

According to police reports, the 35 year old aide was stabbed to death sometime Wednesday evening. The police suspect that someone had met Miss Heet at the door to her apartment building, the Dorset, and either followed her in or came in with her. The door to the building is always locked for security measures with only the tenants and building maintenance holding keys for it. The case is still under investigation.

The Hill community was shocked and saddened at the latest of violent crimes on the Hill in recent years. There have been many reports in the last few years of assaults and violent muggings of staffers who have left their offices for the evening or, in one case, for lunch.

Although no one on The Hill is panicking over the incident, caution is becoming the watchword.

"When anything like this happens, it causes concern," says Jack DeVore, press secretary for Sen. Lloyd Bentsen (D-Tex) whose office is down the hall from Sen. Evans' office. "And," adds DeVore, "when it happens to someone right next door to you, that makes the concern all that more intense."

SALLY HEET

DeVore says that other offices have staffers who have been victims of violent crimes and that "tragedies like this add to the anxieties already there."

Sally Heet, 35, began working for Senator Evans in the fall of 1983 when he was appointed to the seat of the late Sen. Henry (Scoop) Jackson (D-Wash).

Senator's aide found stabbed

WILMINGTON, N.C. 9-18-86

WASHINGTON — Sen. Daniel J. Evans' press secretary, Sally S. Heet, was killed in her Capitol Hill apartment, the senator and police said Thursday.

District of Columbia police said in a statement that Ms. Heet, 35, apparently died of multiple stab wounds, but gave few details of the killing. An autopsy will be conducted today to determine the time and exact cause of death, police said.

Her body was found about 10:30 a.m. by her stepbrother, Jim Hudson, and a member of Evans' staff, the senator said.

"This is one of the saddest times in my 25 years of public life," said Evans, R-Wash., his voice cracking with emotion. "I'll miss her forever."

There was no sign of a struggle in Ms. Heet's third-floor apartment though there was a great deal of blood, Evans said.

Aide to Washington Senator Is Found Stabbed to Death

N.Y. TIMES 4-18-86

WASHINGTON, April 17 (AP) — Senator Daniel J. Evans, Republican of Washington, said his press secretary, Sally S. Heet, was found stabbed to death in her Capitol Hill apartment today.

Mr. Evans said Miss Heet, 35 years old, formerly a resident of Seattle, was "killed apparently last night in her apartment."

The Senator said he had become concerned when Miss Heet failed to meet him and a reporter for breakfast.

Miss Heet's stepbrother and a member of Mr. Evans's staff went to her apartment, where they found the body about 10:30 A.M., Mr. Evans said.

He described Miss Heet as "a close friend, lively and vivacious."

"I'll miss her forever," he said. "She had been a part of a very, very close team. The whole office is in shock."

Police officials said they had no suspects in the death.

Miss Heet joined Mr. Evans's staff as press secretary in 1982 after he took office on the death of Senator Henry Jackson. Before that, she worked as a vice president and manager of corporate communications for the Rainier National Bank. She worked earlier as an account executive for a Seattle public relations concern.

Senator's aide stabbed, dies

FLORIDA STAR 4-25-86

By DOROTHY FULTON
STAR Staff Writer

WASHINGTON — Police today were hunting clues in the fatal stabbing of a U.S. senator's press aide whose blood-stained body was found in her Capitol Hill apartment.

The remains of 35-year-old Sally Heet were discovered by her stepbrother, Jim Hudson, and a member of Sen. Daniel Evans' staff. Evans is a Washington State Republican.

There was no sign of a struggle in the third floor apartment.

Senator Evans said his entire office was in shock.

Hudson, a Labor Dept. employe, and the senator's aide went to Miss Heet's apartment because she failed to report for work. She was last seen leaving the senator's office in the early evening. Her car was parked outside the apartment building.

She joined Evans' staff in 1983 after he took over the job left vacant by Sen. Henry Jackson's death. Before that she was vice president-manager of corporate communications of Rainier National Bank in Seattle.

Sen. Evans' press secretary is found stabbed

Associated Press
NEWS AMERICAN (MD.) 4-18-86

WASHINGTON — Sen. Daniel J. Evans' press secretary, Sally S. Heet, was killed in her Capitol Hill apartment several blocks from her Senate office, the senator and police said Thursday.

District of Columbia police said in a statement that Heet, 35, apparently died of multiple stab wounds but gave few details of the killing. An autopsy will be conducted today to determine the time and exact cause of death, police said.

Her body was found about 10:30 a.m. by her stepbrother Jim Hudson and a member of Evans' staff, the senator said.

"This is one of the saddest times in my 25 years of public life," said Evans, R-Wash., his voice cracking with emotion. "I'll miss her forever."

"She had been a part of a very, very close team. The whole office is in shock," Evans told a news conference. "We all feel we have lost a close member of the family."

Hudson, a Labor Department employee, and the Senate aide went to Heet's apartment because the staff became concerned when she did not come to work by 9:30 a.m., Evans said. The senator declined to identify the aide who accompanied Hudson to the apartment.

There was no sign of a struggle in Heet's third-floor apartment though there was a great deal of blood, Evans said.

Evans said Heet was last seen by her co-workers when she left her Senate office at 8:30 p.m. Wednesday. Her car was parked on the street outside the five-story apartment building, indicating she drove home after work, Evans said.

Mail was found in Heet's mailbox, located just inside the locked front door to the building, the senator said. Visitors must use a telephone to call occupants to gain entry to the building.

"Most of the people here work on Capitol Hill. It's an OK building," said Marian Friedman, who lives in the condominium unit directly above Heet's unit.

Evans said Heet's failure to meet him and *Washington Post* reporter Helen Dewar for an 8 a.m. breakfast at the Capitol had "raised some warnings" because "she is so very prompt and competent and professional in all that she did."

The senator said an aide informed him of Heet's death several hours later while he was attending a hearing of the Senate Foreign Relations Committee.

Richmond native slain in Washington

RICHMOND PALLADIUM-ITEM 4-18-86
By TERRY MIKESELL
Palladium-Item Staff Writer
FRONT PAGE

Washington, D.C. police have no suspects in the slaying of Richmond native Sally Heet, a Senate press secretary found stabbed in her Capitol Hill apartment.

Heet, 35, press secretary for Sen. Daniel J. Evans, R-Wash., was found dead Thursday on the living room floor of her third-floor apartment, the victim of stab wounds, police said.

"This is one of the saddest times in my 25 years of public life," Evans said. "I'll miss her forever," the senator added, his voice cracking with emotion.

Sally Heet

Heet graduated from Richmond High School in 1968 and attended Earlham College for two years before transferring to the University of Washington.

"She had been a part of a very, very close team. The whole office is in shock," Evans said. "We all feel we have lost a close member of the family."

Police said in a statement that Heet died of multiple stab wounds, but they declined to give further details. Police said they had no suspects or motive for the slaying, which occurred several blocks from the U.S. Capitol.

Her body was found by another Evans aide and Heet's stepbrother, Jim Hudson, an employee of the Labor Department. Evans said Heet's car was parked outside the building and Wednesday's mail was still in the mailbox, just inside the locked entrance to the five-story building.

Evans said Heet's failure to meet him and a Washington Post reporter for an 8 a.m. breakfast at the Capitol had "raised some warnings" because "she is so very prompt and competent and professional."

An autopsy was scheduled for today to determine the exact cause and time of death. Evans told reporters it appeared she had been killed Wednesday night after returning to the apartment from her office, which she left at 8:30 p.m.

Visitors must use a telephone to call occupants to gain entry to the building.

"Most of the people here work on Capitol Hill. It's an OK building," one resident, Marian Friedman, said.

The apparent murder shocked Richmond residents who knew Heet.

Evans press aide stabbed to death

By Joel Connelly
P-I Washington Correspondent
SEATTLE P-I 4-18-86

WASHINGTON — Sally Heet, the press secretary of Sen. Dan Evans, R-Wash., was found stabbed to death yesterday in her apartment a few blocks from the U.S. Capitol.

Heet's body was discovered by her brother and a co-worker about 10:30 a.m. after she failed to show up for a breakfast with Evans.

The senator was so shaken he would not permit cameras into a briefing on Heet's slaying.

"We all feel very much like a family here," he said. "She was known for her happiness and vivaciousness."

The Washington, D.C., police department issued a statement saying Heet had apparently died of multiple stab wounds. They gave no details of the killing.

Police launched an intensive investigation, interviewing other residents of the apartment as well as the 35-year-old Heet's co-workers. They carefully went over the press secretary's cluttered office. An autopsy will be conducted today to determine the time and exact cause of death, police said.

Heet's car was found parked across from The Dorset, her apartment house, and her ground floor mailbox was open but mail had not been removed.

"I would presume someone caught up with her there," said Evans. There reportedly was considerable blood in the apartment.

Evans discounted any connection between Heet's death and the terrorism scare that has shaken Capitol Hill in the wake of American bombings in Libya.

"The circumstances of death indicate this is a typical urban homicide," he said.

Mark Murray, an aide to Rep. Don Bonker, D-Olympia, who lives in the same building, said he noticed Heet's open mailbox when he returned to the building about 10:45 p.m. Wednesday. Heet was last seen at Evans' office two hours earlier.

Mugging and break-ins

Murray said residents of The Dorset, which is about eight blocks from the Capitol, had been troubled by burglaries as well as a prowler who had gotten in the front door.

"Somebody had been hanging out inside the front door," he said. "There was a mugging inside the building. We have also had break-ins inside the storeroom."

Ruth Bodner of GLM Companies, which manages most units in The Dorset, said the building's security system is arranged to require guests to call apartment residents in order to gain entry.

Heet was single and lived alone.

Sally Heet was found dead by her brother and a co-worker yesterday morning.

Tearful Evans mourns death of press aide

SEATTLE TIMES 4-19-86

WASHINGTON (AP) — Sen. Dan Evans rose on the floor of the U.S. Senate yesterday to mourn the death of his press secretary, Sally Heet, saying the tribute was "not a farewell, but a celebration of a short and rich life."

Heet, 35, was found dead Thursday on the living room floor of her third-floor Washington apartment.

An autopsy performed yesterday determined that Heet died of multiple stab wounds, said Dr. James Dibdin, deputy medical examiner. He declined to give any further information.

Police investigating the slaying say they have no suspects. They have refused to provide details of the killing.

"Our Senate office deeply mourns this mindless act of violence," Evans said during a tearful Senate speech. "We all feel someone precious has been stolen from our lives."

"She was a self-possessed, confident professional" who was "an integral part of a closely knit family of our senatorial staff," he said.

"Someone has taken Sally's physical presence from us, but no one can steal our memories of her," said Evans, his voice cracking with emotion as tears welled in his eyes.

Aide to US senator killed in stabbing

BOSTON GLOBE 4-18-86

WASHINGTON — Sen. Daniel J. Evans' press secretary, Sally S. Heet, was found dead yesterday in her Capitol Hill apartment several blocks from her Senate office, the apparent victim of a stabbing, police said. "This is one of the saddest times in my 25 years of public life," said Evans (R-Wash.). City police said Heet, 35, apparently died of multiple stab wounds, but gave few details of the killing.

Senator's press secretary killed

MIAMI NEWS 4-18-86

Sally Heet, press secretary to Sen. Daniel Evans of Washington, was killed in her Capitol Hill apartment several blocks from her Senate office, the senator and police said yesterday. District of Columbia police said that Heet, 35, apparently died of multiple stab wounds, but they gave few details of the killing. An autopsy will be conducted today to determine the time and cause of death, police said. Heet joined Evans' staff in 1983 after he took over the seat vacated by the death of Sen. Henry Jackson, D-Wash.

'Stolen from us'

913

Evans eulogizes press secretary in emotional Capitol Hill service

DAILY RECORD CHRONICLE 4-24-86

WASHINGTON — Slain press secretary Sally Heet was mourned and eulogized at a Capitol Hill memorial service Wednesday by 250 colleagues and friends, including Sen. Dan Evans who told the crowd, "Something very special has been stolen from us."

Heet, 35, was found dead in her apartment near the U.S. Capitol April 17. She had been stabbed, but police have given few other details, while detectives are investigating the slaying.

Evans, R-Wash., who hired her as his press secretary in 1983 when he was appointed to the Senate, said Heet brought, "a comradeship and love that made each day just a little brighter."

Tears flowed from many eyes during the half-hour service in the Senate Caucus Room, a large chamber in the Russell Senate Office Building.

Speaking from a podium bedecked with pots of bright yellow flowers, Evans tried to console the crowd, as many wept.

"Use those memories to help us be more professional," he said. "Be inspired by her loveliness, her good cheer, her wisdom. In this way, Sally cannot die, but will live on in the memory of each of us."

Bill Jacobs, Evans' administrative assistant, fought back sobs while reading a eulogy that began, "Sally was our friend. A true friend is more to be esteemed than kinsfolk, and so it was with Sally."

Jacobs, recalling daily office telephone conversations with Heet as they conducted the senator's business, coping with problems and trouble-shooting, said, "The line doesn't ring anymore, but the voice and the greeting rings in my memory. She was an antidote to despair and a tonic to depression."

Tim Hillard, a reporter for KOMO-TV of Seattle, described Heet as a woman of "honesty, intellect and integrity," who won from the news media "respect, trust and friendship."

Citing her "non-stop optimistic energy," Hillard said, "You couldn't help but love her. She instinctively knew our needs and our frustration. Dan Evans never had a better press secretary."

The Sally Heet Memorial Scholarship Fund, created in her memory by the Puget Sound chapter of the Public Relations Society of America in Seattle, is "appropriate," Hillard said.

"She had a commitment to the belief that through better communication there would be better understanding," he said.

Contributions to the scholarship fund can be made at any Rainier National Bank branch in Washington state, or sent to Bruce Emry, Rainier Corporate Communications, NO8-3, P.O. Box 3966, Seattle, Wash., 98124.

Heet, a native of Indiana, lived in Seattle as an adult and was head of corporate public relations for Rainier National Bank.

Her body was discovered by her brother and a co-worker who went to investigate after she failed to show up for work in the morning. There was no sign of forced entry into the apartment and Evans said police initially suspected she was accosted by her killer while attempting to pick up her mail in the lobby.

P-I News Services

WASHINGTON — Sen. Dan Evans rose on the floor of the U.S. Senate yesterday to mourn the death of his press secretary, Sally Heet, saying the tribute was "not a farewell, but a celebration of a short and rich life."

Heet, 35, was found slain Thursday on the living room floor of her third-floor Washington apartment.

Monica Thompson, an assistant to Heet, said yesterday the woman's bloodied body was nude when found in the living room of her apartment.

Thompson was with Heet's stepbrother, Jim Hudson, when they found the body around 10:30 a.m. Thursday. They had gone to Heet's apartment when she failed to show up for work.

"She was in the living room," Thompson said, adding that she immediately left the apartment once she saw Heet's body on the floor.

No suspects

An autopsy performed yesterday determined Heet died of multiple stab wounds, said Dr. James Dibdin, deputy medical examiner.

Police investigating the slaying say they have no suspects. They have refused to provide details of the killing.

"Our Senate office deeply mourns this mindless act of violence," Evans said during a tearful Senate speech. "We all feel someone precious has been stolen from our lives."

"She was a self-possessed, confident professional" who was "an integral part of a closely knit family of our senatorial staff."

"Someone has taken Sally's physical presence from us, but no one can steal our memories of her," said Evans, his voice cracking as tears welled in his eyes.

Friends & family eulogize Sally Heet

913

By Mary Rothschild

P-I Reporter

SEATTLE P-I 4-25-86

Friends and family of Sally Heet gathered yesterday to express "gratitude for her life and sorrow for her death" in an afternoon memorial service at Seattle's Plymouth Congregational Church.

Heet, 35, press secretary to Sen. Dan Evans, was found slain in her apartment near the U.S. Capitol April 17.

Evans hired Heet in 1983 when he was appointed to the Senate. He delivered one of several eulogies yesterday from family members, friends and professional colleagues whom the Rev. Carla Berkedal described as "from different chapters of her life" joined in a "circle of prayer" for the service.

In a quiet, carefully modulated voice, Evans spoke of being "blessed" with an extended family of close-knit staff members. Heet, he said, brought to their lives "a comradeship and love that made each day a little brighter."

As he had in an earlier service in Washington, D.C., Evans said "something very special has been taken from all of us . . . in fact, stolen from us."

Jay Rockey, chairman of The Rockey Co., a local advertising and public relations agency, recalled hiring Heet as an eager graduate of the University of Washington in 1972.

John Mangels, president of Rainier Bank and Heet's supervisor before she was recruited by Evans, remembered the young bank vice president's "unequaled" sense of humor as well as her competence, intelligence, wisdom and "candor that made her an insightful critic."

Two dogwood trees will be planted in Heet's memory in a grove in the University of Washington Arboretum. A scholarship fund to benefit public relations students has been established in her name. Contributions should be sent to The Sally Heet Memorial Scholarship, c/o C. Bruce Emry, Rainier National Bank, Corporate Communications, P.O. Box 3966, NO8-3, Seattle, WA 98134.

Evans offers tearful farewell to aide

THE OLYMPIAN 4-19-86

WASHINGTON (AP) — Sen. Dan Evans rose on the floor of the U.S. Senate on Friday to mourn the death of his press secretary, Sally Heet, saying the tribute was "not a farewell, but a celebration of a short and rich life."

Heet, 35, was found dead Thursday on the living room floor of her third-floor Washington apartment.

An autopsy performed Friday determined that Heet died of multiple stab wounds, said Dr. James Dibdin, deputy medical examiner. Police investigating the slaying say they have no suspects and offered no details of the killing.

"Our Senate office deeply mourns this mindless act of violence," Evans said during a tearful Senate speech. "We all feel someone precious has been stolen from our lives."

"She was a self-possessed, confident professional" who was "an integral part of a closely knit family of our senatorial staff."

"Someone has taken Sally's physical presence from us, but no one can steal our memories of her," said Evans, his voice cracking with emotion as tears welled in his eyes.

He said Heet's first-floor mailbox was open and contained mail, indicating she may have been surprised by her attacker. The mailbox is located in a hallway several steps up from the locked front door to the building.

Visitors must use a telephone to call occupants in order to gain entry to the building.

"Most of the people here work on Capitol Hill. It's an OK building," one resident, Marian Friedman, said.

Heet is survived by her mother, one sister and two brothers.

Sen. Evans mourns aide's death

Police have no suspects, motives in slaying

9/8 BREMERTON SUN 4-18-86

WASHINGTON (AP) — Police have no suspects in the slaying of a Senate press secretary who was found stabbed in her Capitol Hill apartment.

Sally S. Heet, 35, press secretary for Sen. Daniel J. Evans, R-Wash., was found dead yesterday on the living room floor of her third-floor apartment, the victim of stab wounds, police said.

"This is one of the saddest times in my 25 years of public life," Evans said. "I'll miss her forever," the senator added, his voice cracking with emotion as he discussed the killing with reporters.

"She had been a part of a very, very close team. The whole office is in shock," Evans said. "We all feel we have lost a close member of the family."

Police said in a statement that Ms. Heet died of multiple stab wounds, but they declined to give further details of the killing. Police said they had no suspects or motive for the slaying, which occurred several blocks from the U.S. Capitol.

An autopsy was scheduled for today to determine the exact cause and time of death. Evans told reporters it appeared she had been killed Wednesday night after returning to the apartment from her office, which she left at 8:30 p.m.

Ms. Heet's car was parked outside the building.

Her body was found about 10:30 a.m. yesterday after members of Evans' staff became concerned that she had not shown up for work, the senator said.

Sally Heet

Ms. Heet's stepbrother, Jim Hudson, went to the apartment with a member of the senator's staff. Although there was blood found in the apartment, there was no evidence of a struggle or of a break-in, Evans said.

Evans said Ms. Heet's first-floor mailbox was open and contained mail, indicating she may have been surprised by her attacker. The mailbox is located in a hallway several steps up from the locked front door to the building.

Visitors must use a telephone to call occupants in order to gain entry to the building.

"Most of the people here work on Capitol Hill. It's an OK building," one resident, Marian Friedman, said.

Evans said Ms. Heet's failure to meet him and Washington Post reporter Helen Dewar for an 8 a.m. breakfast at the Capitol had "raised some warnings" because "she is so very prompt and competent and professional in all that she did."

The senator said an aide informed him of Ms. Heet's death several hours later while he was attending a hearing of the Senate Foreign Relations Committee.

Evans described Ms. Heet as "a close friend ... lively and vivacious."

Ms. Heet, 35, joined Evans' staff in 1983 after he took over the seat vacated by the death of Sen. Henry L. Jackson, D-Wash. Before that she was vice president and manager of corporate communications of the Rainier National Bank in Seattle. She had previously worked for a Seattle public relations firm, Jay Rockey Public Relations Inc.

A native of Richmond, Ind., she attended Earlham College in that state from 1968 to 1970 before attending the University of Washington, from which she received a bachelor's degree in communications in 1972.

Ms. Heet had been looking for a Seattle-area job in the private sector for about six months to a year but had not found a position she wanted, said Bruce Emry, her successor at Rainier Bank in Seattle.

"She was a pro in every sense of the word," he said. "I can't think of too many people who had more going for herself than Sally.

"I know she had a desire to return here (to Seattle). It was really her first love," he said. "She set out to acquire a certain type of experience in Washington, D.C., and she felt she had gotten that experience."

The apartment building in which Ms. Heet lived is at the end of a tree-lined block of rowhouses in a middle-class section of Capitol Hill.

About six blocks from the U.S. Capitol, the neighborhood is racially mixed and populated by longtime residents and newly arrived young professionals.

"I've never had any problems in this neighborhood and I've never heard of any," said Lisa Zimmerman, an unemployed fiction writer, who lives two doors away from Ms. Heet's building.

Homicide investigators combed the building yesterday, but would not discuss the case with reporters.

John Pazartzis, a graduate student who lives in the building, said "Everyone keeps pretty much to themselves. A couple of months ago there was a note on the front door saying there was a mugging in the lobby, but I've never had any trouble here."

The Washington, D.C., apartment building where Sally Heet, Sen. Dan Evans' press aide, was killed.

A reward fund in Heet slaying

SEATTLE P-I 4-30-86

A reward fund has been set up on Capitol Hill in Washington, D.C., for information that would help solve the slaying of Sally Heet, who was Sen. Dan Evans' press secretary.

Heet, a former vice president at Rainier Bank and account executive with the Jay Rockey public relations firm, was stabbed to death in her Capitol Hill apartment April 17. D.C. police have several possible suspects but have made no arrests.

Contributions to the fund may be sent to the office of Sen. Dan Evans, Attention Monica Thompson, 702 Hart Senate Office Building, Washington, D.C., 20510.

Thompson said $1,000 of the $5,000 goal has been raised.

'She was there when we needed friends'

9/3

SEATTLE P-I 4-24-86

By Joel Connelly
P-I Washington Correspondent

WASHINGTON — The Senate Caucus Room, long a favorite spot on Capitol Hill for happy announcements of presidential candidacies, yesterday was the scene of a somber memorial service for Sally Heet, Sen. Dan Evans' slain press secretary.

Sally Heet

"Something very special has been stolen from us," Evans, R-Wash., told a gathering of more than 200 congressional staff members, reporters and friends of the 35-year-old Heet.

Washington, D.C., police have refused to disclose any details on the stabbing a week ago, aside from leaking news that Heet's personal diary was being examined for clues.

The memorial yesterday included commentaries on the hectic lives of Senate aides, as well as the crucial role played by press secretaries as intermediaries between reporters and lawmakers.

"A press secretary's relations with a politician are perilous at best," said Evans. "He or she is the eyes, ears and voice, the slender thread which links a politician with the people he serves.

"It takes enormous strength to occasionally wrench a senator's foot from his mouth," added the senator.

Bill Jacobs, Evans' administrative assistant, spoke of Heet's skills at releasing tensions and of problems solved after work over lasagna and beer at the Capitol Hill apartment where Heet was slain. And he recalled Heet asking of her meticulous boss: "Was Dan this stubborn when he was governor?"

"When things were not going well, she was the one to say, 'You look troubled. Need a friend?' " said Jacobs. "She was there when we needed friends, someone to whom you could speak your heart with all its badness and goodness."

Tim Hillard, KOMO-TV reporter, said Heet "was den mother to all of us."

Evans and senior aides were to fly to Seattle for a second memorial service, scheduled for 3 p.m. today at Plymouth Congregational Church.

Friends pay tribute to slain Evans aide

9/3

SEATTLE TIMES 4-25-86

The slaying of Sally Heet, press secretary to Sen. Dan Evans, has affected friends and family from coast to coast.

"Something very special has been stolen from us," said Evans, who was one of eight people who talked about their friendship with Heet during a memorial service yesterday. "It is hard to know why something so tragic happened."

She was a good listener as well as a communicator, said several friends, who had known her as a communications student at the University of Washington, a public relations executive with Jay Rockey and a vice president with Rainier Bank.

Many recalled her empathy, as one who would hear and then often respond with the preface: "But what you gotta understand . . ."

Heet, a native of Richmond, Ind., was found stabbed to death April 17 in her Washington, D.C. apartment.

Services had been held for Heet in Washington, D.C., and near her hometown. Her mother, unable to attend services in Seattle yesterday, sent her sentiments via KOMO-TV's Connie Thompson, a friend of Heet.

"She wishes to express that this special tribute is helping to sustain her family in a time of unbearable pain," Thompson said.

Bob Hawkins, president of the Puget Sound Chapter of the Public Relations Society of America announced the creation of the Sally Heet Memorial Scholarship. Two dogwood trees will be planted in the Seattle Arboretum in her memory.

Contributions may be sent to The Sally Heet Memorial Scholarship, Rainier National Bank, Corporate Communications, PO Box 3966, NO8-3, Seattle, 98124.

No clues found in murder of Evans' press aide

Neighbors failed to heed signs something was amiss at apartment

913

SEATTLE TIMES 4-18-86

by Eric Pryne
and Pam Woodroffe
Times staff reporters

WASHINGTON — When you work for the U.S. Congress, late nights come with the job. On Wednesday, Mark Murray, Rep. Don Bonker's administrative assistant, didn't get home until about 10:45 p.m.

He unlocked the front door to his apartment building, The Dorset, a four-story brick structure about five blocks north and six blocks east of the U.S. Capitol.

Murray walked up a short flight of stairs, through a second door and stopped in the dimly lit hall to check for mail before heading for the elevator.

There are 25 locked mailboxes on the left-hand wall in the first-floor corridor at The Dorset. Murray noticed one of them was ajar, but the mail was still inside.

Apartment 301. Sally Heet's apartment.

Murray knew Heet. She also worked on Capitol Hill, as Sen. Dan Evans' press secretary. They bumped into each other regularly, professionally and at home, entering or leaving The Dorset. She came from Seattle. He grew up in Olympia.

"We had been meaning to have dinner for about six months," Murray said.

Murray wondered why Heet's mailbox was open. He wondered if something was wrong, and thought he would ask Heet about it the next time their paths crossed.

By midday yesterday, Murray had heard the news. "I feel like an idiot," he said. "I feel awful."

Sally Heet — University of Washington graduate, former Seattle public-relations executive, vice president of Rainier Bank at 30 — had been found dead on her living-room floor, murdered.

She, like Murray, had worked late Wednesday, leaving Evans' Capitol Hill office for home about 8:30 p.m., co-workers said. When Heet didn't show up for work yesterday, her brother and another Evans employee went over to check and discovered her body.

The police report was cryptic. White female, 35. Body found about 10:30 a.m. yesterday. Pronounced dead at the scene by the medical examiner's office. An autopsy today showed she died of multiple

Please see **HEET** on B 2

Sally Heet
Found murdered

[101]

HEET

continued from B 1

stab wounds.

No apparent motive. No suspects. No further details. Investigation continuing.

Last night, D.C. police posted a guard and sealed the door to Apartment 301, where Heet lived alone. "Do not enter," it said. "Crime scene.'

But the lock showed no signs of having been tampered with. And speculation in the building and among Heet's colleagues was that the murderer had accosted her as she entered the building, perhaps as she was picking up her mail. Then the assailant forced her into her apartment and killed her.

Heet was a vivacious woman, highly regarded by the Northwest press corps here because she ran a fairly open shop, didn't deify her boss and kept a healthy, irreverent perspective on the weighty doings of the Senate.

When Evans offered her the press secretary's post shortly after his appointment to the Senate in 1983, Heet seized the opportunity, leaving a good job at Rainier Bank and a condominium near Lake Sammamish because, she said, she had always wanted to give politics and D.C. a try.

At lunch Wednesday, she chatted idly about what she might like to do when she left D.C. someday — return to the Northwest to take over the communications arm of a good-sized corporation. Over bratwurst and a beer, she talked about how she had been following proposals to build a jail in her neighborhood here.

In the office, she spoke of her plans to show an old friend from Indiana the town over the weekend.

Many congressional staff members live on Capitol Hill. It's a neighborhood of classic 19th-century townhouses and small apartment buildings, close to work, shops and restaurants.

But signs of urban decay and desperation multiply as you drive a few blocks north, east or south. The H Street corridor, just eight blocks north of the Capitol dome, is one of D.C.'s crime hotbeds.

Bill Jacobs, Evans' adminstrative assistant, arrived at work around 9:30 a.m. yesterday. He says he noticed immediately that Heet's car, usually parked near his, wasn't there.

Inside Evans' office in the Hart Senate Office Building, he learned Heet hadn't shown up for an 8 a.m. breakfast with Evans and a Washington Post reporter.

So, around 10 a.m., Monica Thompson, who works in the press office, and Jim Hudson, Heet's brother, who has keys to both The Dorset and Heet's apartment, went over to investigate.

Jacobs said he got a call a few minutes later from Thompson. "Come over and get me," he remembers her saying. "I think Sally's dead."

The police were there when Jacobs arrived. He says they wouldn't let him in, but one local reporter, who glanced in the door before police closed it, counted three bloody fingerprints on the inside jamb about 5 feet off the ground.

A shaken Evans called reporters into his office at 2 p.m., asking that cameras and tape recorders be left outside.

"We'll miss her forever," Evans said, his voice breaking. "We all feel like we've lost a member of our personal family."

Heet, single and with no children, leaves a mother in Indiana, a sister in Seattle, and brothers in Florida, Los Angeles and D.C. But Evans' close-knit staff here is like an extended family as well, and it seemed in shock.

A detective rummaged through Heet's desk. Sen. Mark Hatfield, R-Ore., dropped by with a plant. Other Senate offices called with their condolences.

Shirley Harrod, the receptionist who worked here for Warren Magnuson, then Henry M. Jackson, now Evans, fielded many of the calls. "Pray for us . . ." she told caller after caller.

Back at The Dorset last night, Steven Taub and Andrew Bennett, law students who share the apartment directly under Heet's, said they think they heard a voice cry out around 8:30 p.m. Wednesday. But they thought someone was arguing, they said.

Bill Asbury, Gov. Booth Gardner's chief of protocol, worked with Heet while she was with Evans' office.

"The thing that strikes you — we get uptight about violence in and from Libya," he said. "Yet here is an intimate friend whom we knew well who died violently in our own nation's capital. Would that we could stop that."

Sally Heet

SEATTLE TIMES 4-20-86

When Sally Heet, Washington Sen. Dan Evans' press secretary, was found slain last week in her Washington, D.C., apartment, the first question on many minds was whether the shocking crime was in any way connected with terrorism. Such is the temper of the times.

The fact that Heet's death evidently fits into the category of urban crime rather than terrorism is no source of consolation, and it is a reminder that ordinary violent crime remains more of a threat to American society than terrorist acts which, though alarming, are comparatively infrequent. Senseless, random murders occur in many U.S. cities every day of the year.

Those of us in the news media who knew Sally Heet personally, and were assisted by her on many occasions, can attest to her professionalism, competency and warm and friendly personality. She will be missed. Our deep regrets go to her family, her co-workers and her many friends.

Senator's press secretary is slain in Capitol Hill condo

WA. TIMES 4-18-86

By Matt Neufeld and Jim Clardy
THE WASHINGTON TIMES

The press secretary for a Republican senator from Washington was found dead, apparently of stab wounds, yesterday morning in her Capitol Hill apartment.

Members of congressional staffs yesterday mourned the apparent slaying of Sally S. Heet, 35, who had worked three years for Sen. Daniel Evans.

The body of Miss Heet, who lived alone, was found by her step-brother and a co-worker in her third-floor condominium in the 500 block of E Street NE about 10:30 a.m. after she failed to show up for work, said Metropolitan Police Sgt. Joe C. Gentile.

Sgt. Gentile said police had no motives or suspects. Miss Heet was stabbed several times and was pronounced dead at the scene by a doctor with the D.C. Medical Examiner's Office, he said.

There was no sign of forced entry to the apartment and no signs of a struggle, police said.

Miss Heet was found by her step-brother, Labor Department employee Jim Hudson, and an unidentified co-worker after members of Mr. Evans' staff became concerned when she didn't show up for work about 8:30 a.m. yesterday, staff members said.

Police said that an autopsy scheduled to be performed today by the medical examiner's office will determine the time of Miss Heet's death and whether she was sexually assaulted.

Mr. Evans said at a press conference yesterday afternoon that Miss Heet was "a close friend and confidante ... an outstanding press secretary. We'll miss her forever."

"He felt deep personal regrets," said Lee Keller Reis, Mr. Evans' deputy secretary and a close friend and co-worker of Miss Heet. "There's going to be a void that will be difficult to fill."

"She was one of the best press secretaries on the Hill and respected by everybody," said Richard Moore, press secretary to Sen. Mack Mattingly, Georgia Republican. "She was a warm, wonderful person, funny and vivacious, talkative and easy to get to know."

Several residents of E Street and residents of Miss Heet's building, a four-story white brick building called the Dorset, said their neighborhood usually was quiet and crime-free. Connie Tucker, who lives two doors away from Miss Heet's condominium, said storage rooms in the Dorset's basement were broken into a year ago and again "a few weeks ago."

Mrs. Tucker said the front and back doors of the Dorset "take a long time to close" and speculated that someone could enter the building while the doors slowly closed. The front and back doors remain locked, and visitors can enter the building only after contacting the host through an intercom, she said.

Mrs. Tucker and a man who lives next to Miss Heet's condominium said they did not see or hear anything unusual yesterday morning or Wednesday night. Both residents said they did not know Miss Heet.

Sen. Evan's wife, Nancy, said Miss Heet joined her husband's Senate campaign in 1983 as a volunteer in the press office. She described Miss Heet as "very nice, easy going. We all enjoyed her tremendously."

The senator's office was inundated yesterday by calls from the Washington press corps and friends both on Capitol Hill and in Seattle. Miss Heet's hometown, where she developed a reputation as a public relations corporate executive. She worked from 1973 to 1978 as an account executive with a public relations firm and from 1978 to 1983 she was a public relations executive with the Rainier National Bank in Seattle, according to her resume.

Miss Heet told Mr. Moore six months ago that she would probably move back to the Northwest within the year, he said.

"She loved Sen. Evans and wouldn't have come to D.C. to work for anybody else. She enjoyed her job but her real heart was in the Pacific Northwest, where she had so many old friends and loved the country. She wanted to get back into the real world and the private sector," he said.

Mr. Moore said that news of her death left him "absolutely devastated."

"She wasn't a large person. Under no circumstance can I imagine her putting up any struggle. She was also a cool-witted person who was unlikely to ever lose her cool."

Miss Heet was elected in January to the board of directors of the U.S. Senate Press Secretary's Organization. A member said she was an "extremely energetic person, the first to pitch in to help and extremely well thought of."

Mary Lou Edelson, press secretary to Sen. Robert Packwood, Oregon Republican, was elected to the press secretary's organization with Miss Heet in January and remembered her yesterday as a "very hard worker and very practical. You couldn't ask to work with anybody better."

Janet McElligott, who now works for the National Republican Senatorial Committee, was interviewed for her first Washington job by Miss Heet 2½ years ago. "She was a wonderful person who was extremely kind, very dedicated and hardworking," she said.

Capitol Hill condo

Sally S. Heet

said they did not know Miss Heet.

Sen. Evan's wife, Nancy, said Miss Heet joined her husband's Senate campaign in 1983 as a volunteer in the press office. She described Miss Heet as "very nice, easy-going. We all enjoyed her tremendously."

The senator's office was inundated yesterday by calls from the Washington press corps and friends both on Capitol Hill and in Seattle. Miss Heet's hometown, where she developed a reputation as a public relations corporate executive. She worked from 1973 to 1978 as an account executive with a public relations firm and from 1978 to 1983 she was a public relations executive with the Rainier National Bank in Seattle, according to her resume.

Miss Heet told Mr. Moore six months ago that she would probably move back to the Northwest within the year, he said.

"She loved Sen. Evans and wouldn't have come to D.C. to work for anybody else. She enjoyed her job but her real heart was in the Pacific Northwest, where she had so many old friends and loved the country. She wanted to get back into the real world and the private sector," he said.

Mr. Moore said that news of her death left him "absolutely devastated."

"She wasn't a large person. Under no circumstance can I imagine her putting up any struggle. She was also a cool-witted person who was unlikely to ever lose her cool."

Miss Heet was elected in January to the board of directors of the U.S. Senate Press Secretary's Organization. A member said she was an "extremely energetic person, the first to pitch in to help and extremely well thought of."

Mary Lou Edelson, press secretary to Sen. Robert Packwood, Oregon Republican, was elected to the press secretary's organization with Miss Heet in January and remembered her yesterday as a "very hard worker and very practical. You couldn't ask to work with anybody better."

Janet McElligott, who now works for the National Republican Senatorial Committee, was interviewed for her first Washington job by Miss Heet 2½ years ago. "She was a wonderful person who was extremely kind, very dedicated and hardworking," she said.

He who plants a tree,—
He plants love,
Tents of coolness spreading out above
Wayfarers he may not live to see.
Gifts that grow are best;
Hands that bless are blest;
Plant! life does the rest!
Heaven and earth help him who plants a tree,
And his work its own reward shall be.

— From "*Plant a Tree*" by Lucy Larcom

Sally Heet was born August 16, 1950, in Gary, Indiana, and grew up in Michigan. She attended Earlham College in Indiana and was graduated with honors with a B.A. degree in communications from the University of Washington in 1972.

Following graduation, she worked as an account executive at the Dorothy Matin Agency and later at Jay Rockey Public Relations. She joined Rainier National Bank in Seattle as public relations manager, and in 1981 was appointed vice president and manager of the Corporate Communications Division.

When Senator Dan Evans was first appointed to the Senate in 1983, he recruited Sally to be his press secretary.

Sally was a giving person and enjoyed helping others. She was a frequent and popular speaker before university classes across the state and was a mentor to many fledging public relations students.

Sally is survived by her mother, Mrs. Berdyne Hudson, and her grandmother, Alice Swisher, both of Richmond, Indiana. Other family members include a sister, Holly Hudson, who lives in Kirkland; brothers: Jim Hudson of Washington, D.C.; Bill Hudson, of Orlando, Florida; Gary Heet of Santa Barbara, California; and her Redmond cousins Jim and Marilyn Hogan and their sons: Rick, Mike and Bill.

Senator Daniel J. Evans

SALLY S. HEET
. . . died of multiple stab wounds

Press Secretary of Senator Found Slain in Hill Apartment

WA. POST 4-18-86

By Linda Wheeler
Washington Post Staff Writer

The press secretary to U.S. Sen. Daniel J. Evans (R-Wash.) was found stabbed to death yesterday in her condominium six blocks from Evans' Capitol Hill office, D.C. police said.

The body of Sally S. Heet, 35, was found about 10:30 a.m. in her blood-stained apartment at 520 E St. NE by her stepbrother and a colleague, who went looking for her after she failed to join Evans and a reporter for an 8 a.m. breakfast interview, according to the senator.

D.C. police said Heet apparently died of multiple stab wounds, but refused to say exactly where the body was found or whether a weapon had been located. Police said they have no suspects or motive. An autopsy will be conducted today to determine the time and exact cause of death.

Yesterday afternoon, the door to Heet's apartment stood open as District police searched the apartment for clues. The door jamb, about five feet above the floor, was streaked with bloody finger marks.

According to Evans, Heet, who was single and lived alone, left his

See SLAY, B5, Col. 1

Senator's Press Aide Found Slain

SLAY, From B1

office about 8:30 p.m. Wednesday. "We know she arrived at the building because her car is still parked out front," Evans said. "But her mailbox was found open with the mail still inside. It looks like someone met up with her at that point."

Evans said Heet came to work for him as part of his transition team in September 1983 when he was appointed after the death of Sen. Henry M. (Scoop) Jackson (D-Wash.). He said Heet moved to the E Street address at that time.

The condominium, known as the Dorset, was renovated about five years ago. The front door is kept locked and visitors must telephone from the door for admittance.

Marian Friedman, who lives above Heet's apartment, said she heard no unusual noises Wednesday night.

"We haven't had many problems here," she said. "Someone was mugged in the lobby a couple of months ago."

Friedman, who works as an information guide at the Smithsonian Institution, said the four-story building has neither a superintendent nor an elevator operator. She also said that most of the residents of the Dorset work on Capitol Hill.

Lisa Riggles, a 29-year-old artist who lives a half-block away from the Dorset on the 600 block of Acker Street NE, said her street had been plagued by crime, including a slaying, burglary and a stabbing since February.

"We've decided to move to a nicer neighborhood on the other side of the Hill," she said as she walked her two large dogs near Heet's building.

Heet, a native of Indiana, moved to Seattle in 1970 to attend the University of Washington, where she received a bachelor's degree in communications. Before joining Evans' staff, Heet was vice president and manager of corporate communications of the Rainier National Bank in Seattle.

"She was a close friend and a confidant," Evans told reporters, who gathered in his office several hours after Heet's body was found. "She was a very self-possessed, independent and competent woman. We will miss her forever."

One of the reporters attending Evans' news conference was Eric Payne of The Seattle Times, who said he knew Heet well.

"We had lunch just yesterday," he said. "She was very good at what she did. She did not have a background in journalism, but she knew how to handle reporters. Sally was very popular with all the press corps from the Northwest papers."

Capital will miss Sally's sense of perspective

SEATTLE P-I 4-21-86

JOEL CONNELLY

WASHINGTON — In this socially stratified, power-preoccupied capital, one voice on the telephone always announced that it genuinely wanted to talk with you: "Hi, this is Sally."

The voice belonged to Sally Heet, press secretary to Sen. Dan Evans. Heet was stabbed to death in her Capitol Hill apartment last Wednesday night. She will be buried in Seattle Thursday. D.C. police, sensibly and mercifully, have disclosed few details of the murder.

One paradoxical, dreadful consequence of this slaying is Northwesterners in the capital will no longer have Sally Heet around to help deal with irrational happenings here. She was a counted-on confidante, as well as an imaginative social organizer whose sense of the occasion would always dispel tension.

At lunch a week ago, this reporter joked with Heet about the pace and pressures of Senate work. Heet, who left a vice presidency at Rainier Bank for the gypsy world of politics, responded with tales about Dan Evans' first frantic days in 1983 after being appointed to succeed the late Sen. Henry Jackson.

Later last week, in the soft voice that defines terrible loss, Evans' top aide, Bill Jacobs, recalled one such tale.

"The senator, myself and Sally stumbled over to the American Cafe about 1:30 in the morning," said Jacobs. "We were totally exhausted, but we still had to answer a newspaper questionnaire. Sally raised a glass and said, 'I would propose a toast to the person who brought us all together.' It broke the ice, and we got down to work."

Although raised in Michigan, Heet adopted the Northwest's informality during a decade in Seattle, and took back to the capital a regional habit of valuing person rather than position.

One result was a healthy irreverence toward her boss's exalted status. Evans is notoriously tardy for meetings, because of his intellectual curiosity and attention to legislative detail. Instead of solemn excuses, Heet kept a running wager with reporters on how many minutes late "Dan" would be at briefings.

Heet inspired Evans' "News Splash," a summer press conference held at poolside in Virginia. She even managed to turn up monogrammed towels for last year's event.

During last November's Thanksgiving holiday, it was Heet who thought to put on a dinner party for those who found themselves far from home. At another such gathering, former "60 Minutes" commentator Nicholas Von Hoffman, jaded and cynical, received a much-needed dose of ant-iwar idealism from Rick Rolf, Sen. Mark Hatfield's press secretary.

Such gatherings helped meld Evans' staff into an extended family. What other staff would go Christmas caroling at Wolf Trap? Heet prodded one legislative aide to organize a raft trip down the Shenandoah River. Another was chided to abandon workaholic tendencies long enough to do a bit of dating.

Beyond her office, however, Heet helped others on "the Hill" resist temptations to adopt Washington, D.C., social values.

The capital is an environment that encourages self-importance. The "power lunch" is an institution. President Nixon's press secretary Ron Ziegler once kept an aide busy setting up tennis matches with the requirement that his partners be of at least equal White House rank.

A female Reagan aide recently groused to the Wall Street Journal that she couldn't be caught "dating down" at White House functions. Another friend of this writer has proudly related, three times, how his question at a dinner party prompted a gruff and boorish response from President Reagan's communications director, Patrick Buchanan.

Sadly, some Northwesterners have gone native, adapting a cushy life of corporate directorships, cushy consulting contracts and a caste system more rigid than pre-Gandhi India. They have trouble going home.

Sally Heet was about ready to go home. She could still laugh at the end of 13-hour workdays but envied the hours at which friends in Seattle were able to knock off work. She had begun to sound out job opportunities.

The pending departure was being handled with characteristic grace and humor.

"I recently received a prospectus for director of a botanical garden in New York at an annual salary of $100,000," said Jacobs. "I called her over and said, 'Hey, Sally, I have something for you.' She laughed uproariously."

We will miss, and for a long time, Sally Heet's laugh, her competence and above all her sense of perspective.

Suspect questioned in Heet's killing

By Joel Connelly
P-I Washington Correspondent

WASHINGTON — A prime suspect in the April slaying of Sally Heet, Sen. Dan Evans' press secretary, was questioned at length last week and flunked a polygraph test, sources close to the Washington, D.C., police investigation said yesterday.

The suspect, known to Heet and familiar with the Capitol Hill building where her body was found, has not been charged and his identity has not been officially disclosed by police.

Heet, 35, was found stabbed to death in her Capitol Hill apartment on the morning of April 17 after she failed to show up for a press breakfast with Sen. Evans and a reporter from The Washington Post.

The suspect was reportedly questioned by police over a 12-hour period last week and was informed by police that they believe he killed Heet. He had previously been questioned several times during the three-month investigation.

The suspect has since retained an attorney, to assess evidence and advise him, sources said.

The Washington, D.C., police department declined comment on the case other than to repeat that "substantial progress" has been made in the cross-country investigation.

A source close to the investigation said charges may be brought within the next week.

In recent weeks, police have reportedly focused on several pieces of evidence. Fingerprints were found in Heet's apartment. The killer left a blood trail out a hard-to-find exit, known mainly to those who had lived in the building. No signs of struggle were found in the apartment. Heet's mailbox had been opened on the night of the crime. However, the slaying weapon has not been found.

Heet was a vice president at Rainier Bank in Seattle before joining Evans' staff shortly after his appointment to the Senate in 1983 to fill the seat of the late Sen. Henry Jackson. She was also a former executive at The Rockey Co. Inc., a Seattle public relations firm.

U.S. Senate
Press Secretaries Association

**********SALLY HEET MEMORIAL SERVICE**********

There will be a memorial service for Sally Heet, press secretary for Senator Evans, on Wednesday April 23rd at Noon in the Russell Caucus Room (325 Russell).

A memorial scholarship fund is being set up through her former employer, the Rainier National Bank in Washington state. We will provide specific information on the fund and where to send contributions in a later mailing. The family has requested that in lieu of flowers contributions be made to the scholarship fund.

My apologies if this note comes too late for you to attend the memorial service. Notice was short and we attempted to telephone as many people as possible.

Sally was a highly respected press secretary and had many friends on the Hill. She joined the Senate Press Secretaries Association soon after coming to Washington and was recently elected to the Board of Directors. She was playing a big role in helping to plan our upcoming trip to New York.

There are no adequate words to express our sadness and our grief over the loss of such a good friend. She will be missed by all of us.

Sally Heet

One of the most professional press secretaries in the Northwest delegation is gone. Sally Heet, press secretary to Sen. Dan Evans, was a victim of homicide last week.

With great ease, Sally made what can often be a very difficult transition -- from corporate public relations to political p.r. She came to the Evans transition team from a vice presidency at Rainier Bank of Seattle.

Press secretaries generally reflect their bosses and Sally's thoroughgoing civility was, in one sense, a reflection of Evans' own good manners. Sally also brought immense good humor to her task, which is something that's rare and refreshing in the stressful, contentious world of politics.

In Sally's death, we in the press corps have lost something of great value. And many of us have lost a good friend.

SERVICES FOR SALLY HEET APRIL 24

A memorial service for Sally S. Heet, press secretary for Sen. Dan Evans and former Rainier National Bank vice president, is scheduled for 3:00 p.m., Thursday, April 24, at Plymouth Congregational Church, Sixth and University, Seattle.

Friends of Ms. Heet and the Puget Sound Chapter of the Public Relations Society of America have established a scholarship fund in her name. Contributions to the Sally Heet Memorial Scholarship Fund may be made at any Rainier National Bank Branch in Washington.

Ms. Heet was a 15-year veteran of the public relations profession. After graduating with honors from the University of Washington in 1972, she worked as an account executive for the Dorothy Matin and Jay Rockey public relations agencies, both in Seattle. She joined Rainier Bank in 1978 and was vice president for Corporate Communications when she was named to the Evans staff in the fall of 1983.

She was killed April 17 during an apparent burglary of her Wash., D.C., apartment. She was 35.

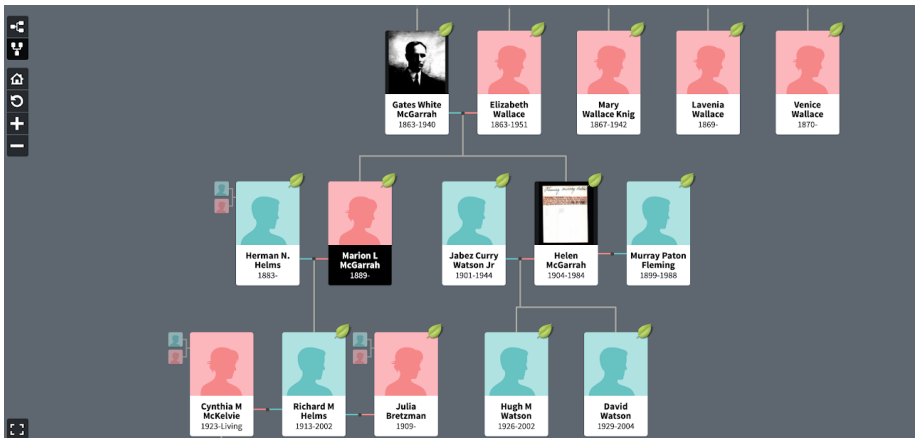
Richard McGarrah Helms (born 1913)

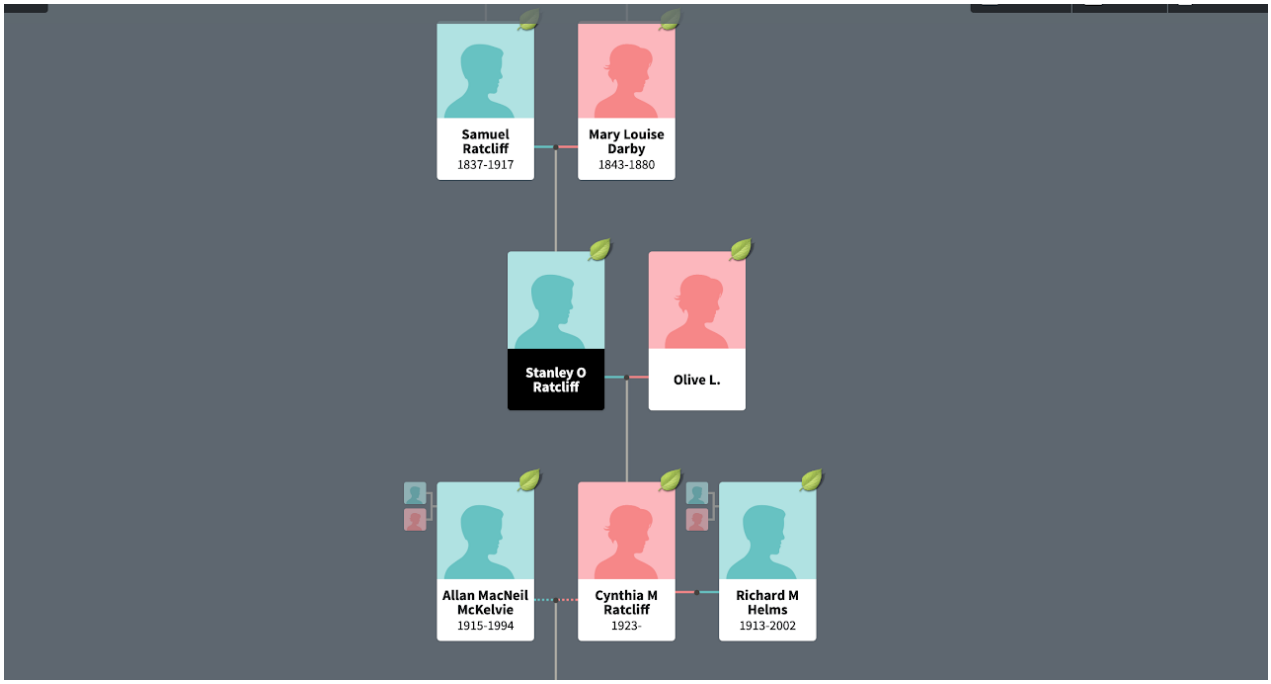
Wikipedia - https://en.wikipedia.org/wiki/Richard_Helms

Richard McGarrah Helms (March 30, 1913 – October 23, 2002)

Richard Helms was director of the Central Intelligence Agency from 1966-1973. He. replaced John McCone. Helms had an intelligence background as a member of the OSS during World War II.



Richard Helms background gets a little disturbing when looking at his second wife. **Cynthia Ratcliff** was born in 1923 in London. the daughter of a British diplomat or spy who was stationed in Shanghai, China no later than 1924. Cynthia first married a Scot, Allan McNeil McKelvie. He was a medical doctor. The couple moved to Vancouver, Canada, and looked to have been living there for around 7 years. He obtained a position at the Mayo Clinic in Minnesota and they applied for naturalization. Or, perhaps, she was living in Vancouver and he was working at Mayo, because he was working for the US Navy in 1942. They had four children, but at this time, we're not sure where they were born. The McKelvie's were married in London in 1943 and were living in Vancouver by 1948. Their U.S. naturalization papers were filed in 1956.



This gets more disturbing when you realize the current DNI recently appointed by President Trump is **John Lee Ratcliff**. When you check the London births of John Lee Ratcliff's, you stop looking because there are so many. Aside from the obvious question, it is a legitimate question to ask if Richard Helms was set up to be placed in the position very early on.

Source: Obituary from The Washington Times Newspaper, Washington, D.C., USA
Monday, May 30, 1994

Allan M. McKelvie, 78, orthopedic surgeon: Newspaper Obituary and Death Notice
Washington Times, The (DC) - Monday, May 30, 1994

Deceased Name: Allan M. McKelvie, 78, orthopedic surgeon

Allan McNeill McKelvie, a newly retired surgeon and scholar, died of cancer at his home in the District May 27. He was 78.

In 1959, Dr. McKelvie began what became a life-long effort to bring orthopedic surgery to the poor and polio-ravaged children of the developing world.

At his own expense and accepting no payment, he typically spent six weeks each year setting up a program and operating on children. His crusade took him to 13 countries including Nigeria, Afghanistan, Kurdestan and, most recently, the former Soviet Union.

His research on scoliosis, thalidomide, polio and war wounds led to many honors, including the Vicennial Medal and the membre d'honneur Sicot.

Dr. McKelvie's local patients included students and faculty of the Cathedral Schools and Episcopal High School as well as Washington leaders, professional athletes and movie stars.

His primary affiliation was with Georgetown University Hospital and Medical School, where he was associate clinical professor of surgery from 1952 to 1987. He was appointed professor emeritus in 1989.

Dr. McKelvie, who retired three weeks ago, was born in Greenock, Scotland, in 1915. He emigrated to the United States in 1946 after training at Glasgow University and service as a Royal Navy doctor in World War II. He won the Commonwealth Fellowship to study for three years at the Mayo Clinic in Rochester, Minn.

Dr. McKelvie headed the Scoliosis Clinic at Children's Hospital from 1953 to 1969, served as consultant to the National Institutes of Health from 1968 to 1986, and was chief of orthopedics at both Children's Hospital and Arlington Hospital in the mid-1960s. He was a member of the governing board of the National Cathedral School from 1966 to 1969.

He was chairman of Orthopedics Overseas from 1973 to 1979 and in 1977 was elected president of World Orthopedic Concern.

His 1943 marriage to Cynthia Ratcliff ended in divorce in 1968.

Computer Replaces Spy-In-Street For Antiriot Sleuthing

By James Wrightson
McClatchy newspapers staff writer

SANTA MONICA — When a man has a title "counterinsurgency specialist" people are sure he is in the cloak-and-dagger business.

Speak of an "intelligence operation" and one envisions an agent in a trench coat standing on a bridge in the fog with one half a dollar bill to match the other half held by another fog-shrouded agent.

Dr. William W. Herrmann, counterinsurgency specialist, computer expert, systems analyst and nonsalaried head of the task force on riots and disorders for the California Council on Criminal Justice, often speaks of "collecting intelligence" and "coordinating intelligence."

But he does not like the sinister image it evokes.

He says it is mean and misleading.

He resents the use of the terms "doomsday machine" and "Big Brother Operation" which writers have applied to one recommendation of his task force.

The recommendation, approved by the council, calls for "a coordinated intelligence system for the collection, analysis, interpretation and dissemination of information relative to the prediction, detection, prevention, suppression and control of civil commotion, riots and disorders."

Limited Role

Herrmann bridles at an article in the London Observer, widely distributed in the United States, which says his task force is hatching a grandiose plan "to forestall revolution in America drawing partly on ideas developed by the British for crushing Communist subversives in Malaya."

The Observer calls it "Ronald Reagan's secret game plan for saving America."

"The council could not set up a plan like that," Herrmann said in an interview in his office in the System Development Corp., where he holds the title of "senior operations scientist and counterinsurgency specialist."

"We have a nonoperational role," Herrmann says. "All we can do is review and fund projects suggested by local authorities.

Dr. William W. Herrmann

"It never was our intent to set up a centralized intelligence capacity.

"The control of riots and disorders is a local responsibility. Two presidents of the United States and Gov. Reagan have said that.

"That is one reason we were careful in our recommendation to use the word 'coordinated' rather than 'centralized' when describing a system."

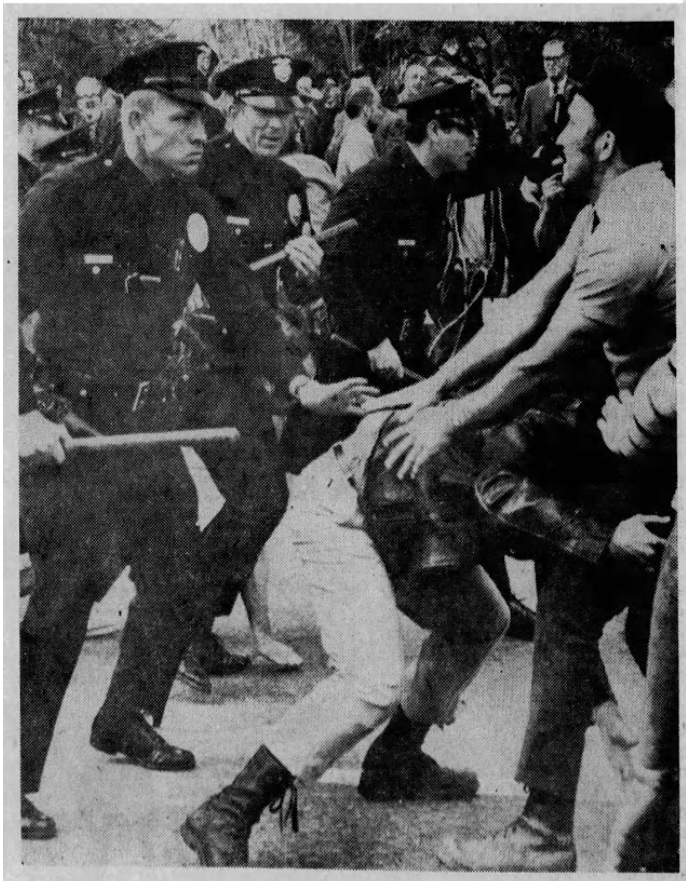
Herrmann is a friendly, unassuming man, 45 years old, who served in the Los Angeles Police Department (LAPD) for 21 years.

He sits in his Santa Monica office surrounded by books on psychology and social psychology, technology and development not solely related to computers, books on political science and political theory, police communication, and the theory of warfare from Karl von Clausewitz to Mao Tse-tung.

A week after he joined the LAPD in 1946 he enrolled in the University of Southern California. Going to school while working full-time as a

See Page E4, Col. 5

Computers Can Help Prevent Civil Strife



Could Computers Prevent This?

William W. Herrmann, counterinsurgency expert and systems analyst, proposes a state intelligence system utilizing computers to prevent riots and other civil disorders. A systematic, computer-aided study of economic, political and social conditions could, he believes, prevent confrontations such as this one between demonstrators and Los Angeles police.

AP Wirephoto

Continued From Page E1

police officer, he earned his degree in public administration in 1952. He got his master's degree in political science and public administration in 1956 and his doctorate in public administration and psychology from USC in 1960.

He worked from 1966 to 1968 as a consultant on counterinsurgency for the Institute of Defense Analysis at the RAND Corp., a Santa Monica think tank and onetime parent company to System Development Corp.

He went to Thailand for the Agency for International Development (AID) in 1967 and again this year for the Department of Defense.

Insurgents Studied

Herrmann studied insurgent movements in Algeria, Malaya, Greece, Cyprus and Crete while he was at RAND. His publications at RAND are classified documents.

But he says he was appointed to the California Council on Criminal Justice by Gov. Ronald Reagan, not because he is an expert in counterinsurgency, but because of his work on systems analysis, which consists of finding out what the problem is, setting goals, looking at alternatives, then laying out a program.

Charles O'Brien, deputy attorney general, and liberal Democratic candidate for attorney general, says of Herrmann:

"He knows as much about computers and law enforcement as any man in the state. We seriously considered hiring him to set up the California Department of Justice Information System (a computer-based network for storing information on criminals, their methods and operation).

Herrmann is especially impatient with persons who see the use of computers in law enforcement as sinister.

"Those people are the same kinds of people who would believe that using magnetized rods will cure cancer," he says.

"A computer doesn't collect information. Law enforcement agencies, insurance companies, county asssessors, credit card companies do that. A computer stores information and retrieves it. With a computer you can analyze data and establish patterns.

"The history of man has shown many repressive regimes before there was any knowledge of computers."

The intelligence system Herrmann proposes for the state would, he believes, help prevent riots and civil disorders by using computers as an aid in a systematic study of economic, political and social conditions in communities.

Preventive Action

Authorities could tell when a blow-up is coming and head it off, not necessarily by massive force, but, it is hoped, by moving to correct the conditions which are causing the unrest.

The task force program for handling riots would first attempt to predict riot situations; second, attempt to prevent them; third, slow them down and quell them if they occur, and finally, "alleviate the effects" — that is clean up and repair the damage in the riot-torn area and rebuild the relationship between the authorities and the citizens.

His personal view, which he says does not necessarily reflect the attitude of the task force of the California Council on Criminal Justice, is that there are "hard-core dedicated revolutionaries who manufacture and plant bombs in this country.

"The solution to handling those people is different from that of handling a person who may occasionally throw a rock or even a Molotov cocktail," he says.

"You don't glorify the bomb makers and throwers by referring to them as revolutionaries or national liberation leaders.

"You call them arsonists, or murderers, or whatever, according to the crime they commit.

"One problem is to keep the neutrals from siding with the bomb-throwers.

"To do this requires more than tough police tactics. The government must find a program to win the minds and hearts of the people."

Who's Who?

Herrmann thinks this requires not only separating the hard-core activists from the reformers, but also requires determining which of the grievances are legitimate and which are merely contrived.

As for the threat of a centralized intelligence agency of government reaching into people's private lives, Herrmann just does not see it happening here.

"There is probably more information on people's personal lives in the hands of private enterprise than there is in the hands of the government," he says.

He gives as examples the computers of credit rating systems, insurance company files and the like. In such privately owned computers is stored information on a person's income, his ownership of property, his assets and his buying habits.

As for the task force recommendation, Herrmann says it is in no way intended to build a "centralized" agency. He says under the federal Omnibus Crime Control and Safe Streets Act of 1968, 75 per cent of the federal money for California, anticipated at $34 million for 1970-71, must go to local projects.

Dual Function

The 29-member Council on Criminal Justice functions to approve the local projects and allocate these federal funds.

It has turned down two projects which would set up what might be termed a "central intelligence agency."

One was by the California Department of the Military for a "central repository" for collecting, evaluating and disseminating information to all law enfofcement agencies and public officials and state military force commanders on "unlawful antigovernment activities."

The other was a proposal by the California Disaster Office calling for $898,000 in expenditures over a three-year period to establish a "central clearing house and information storage unit" for intelligence relating to civil disorders, riots and related incidents in the state.

A proposal by the LAPD for an 18-month project costing $681,000 to use a computer to put social, political and economic information into a mathematical probability model has been deferred.

[...]

C. William Herrmann

William Herrmann was born in Danzig, Germany in 1936. **He arrived in the United States in 1950 and settled in Michigan**. **After graduating high school he joined the United States Army, specializing in ordnance and transportation. He was honorably discharged in 1959.** From 1962 to 1964 he worked for an air freight company, Worldwide Services, at Kennedy Air port in New York. In 1964 he started his own air freight forwarding company at Kennedy Air port, Continental Air Transport. Continental had offices throughout Europe and the Middle East.154 Continental operated until 1964, when "complications at Kennedy Airport" 155 forced him to close down. In 1970, Herrmann established International Resources Development Company (IRDC).156 IRDC was engaged in the arms business, specializing in small arms: pistols, submachine guns and revolvers.157 IRDC shipped directly out of Brazil to its clients worldwide.158 Herrmann operated IRDC in New Jersey and Frankfurt, Germany between 1970 and 1985, when it closed.159 Herrmann unconvincingly claims that no records of IRDC's business dealings exist because they were destroyed by the warehouse people that housed them for non-payment of bills. (160)

Herrmann first started selling military arms to Iran 161 in 1980, following a meeting with Hamid Nagashian who was, at the time, the authorized arms procurement official for the Revolutionary Guard in Iran.162 Herrmann was introduced to Nagashian in the fall of 1980 by Otto Schaller, another arms dealer and friend of Manuchehr Ghorbanifar. 163 During the meeting, Herrmann testified, Nagashian told him that he was interested in purchasing arms for the Revolutionary Guard. Herrmann showed Nagashian brochures from Taurus International, a Brazilian manufacturer licensed by Baretta.

Nagashan placed orders for three models of guns.164 The guns were then shipped to Iran by Taurus, and Herrmann collected a commission.165

Nahshan and Herrmann thereafter established an ongoing business relationship. According to Herrmann, whenever nagashian needed additional guns he would conact Herrmann, who would plae an order with Taurus (166). This arrangement lasted from 1981 to 1985 (167), when Herrmann got out of the business (168).

Herrmann stated that in January, 1981 he was invited to Tehran by Deputy Minister of Defense, Ahmed Azzizi.169 The purpose of the trip was to negotiate arm purchases for the Iranian Army. According to Herrmann, Nagashian had arranged the Azzizi invitation.170 Herrmann stated that he arrived in Tehran on approximately January 18, 1981 171 and was provided accommodations at the Hilton Hotel.172 Herrmann said that Nagashian came to the Hilton on January 21, 1981, to discuss the release of the hostages. Herrmann stated that Nagashian told him that the timing of the hostage release was the result of a deal with Reagan campaign people; some of his testimony follows:

- Q : And tell us, if you would, what Nagashaian told you, if anything, about the release of the hostages ?
- A : Well, he told me that a deal had been negotiated by some people in the Reagan administration and that the hostages would be released at the time Reafan was sworn in
- Q: Did you ask Nagashian how he came to know this?
- Joint Report of the Task Force to Investigate Certain Allegations Concerning the Holding of American Hostages by Iran in 1980 ("October Surprise Task Force")

160

A: Yes. Well, I didn't ask him, he told me.

OjAndwhatdidhetellyou?

A: That he was aware and he had been in Europe at the time when the negotiations took place.

Oj He, Nagashian, was personally in Europe at the time?

A: He was in Europe at the time, yes.

Qj And tell me specifically what he said with respect to how that agree ment came to take place?

A: He said for some time the Irani ans had been negotiating with senior officials in the Reagan administration on the release of the hostages and also the delay in releasing them earlier.

Oj Did he indicate to you at this time who, on behalf of Iran, was in volved in these discussions?

A: Mohammed Beheshti, Hakim, Rafsanjani, Mohsen Rafiqdust. Meet ings with Casey, Allen and McFarlane. These were the three people that were involved.

Qj So from Iran's standpoint, Naga shian says the three individuals in volved in the negotiations concerning the hostages for the [Iranians] were Beheshti, Hakim, Rafsanjani and Mohsen Rafiqdust, and the people working or negotiating with them on behalf of the United States were Wil liam Casey, Richard Allen and Robert McFarlane. Where did he say the ne gotiation took place?

A: He said the negotiations took place in Paris.

Oj Where in Paris, do you recall? A: He didn't say.

Qj When in Paris?

A: October, September, October, 1980.

Oj Did he indicate that he, himself, had attended these meetings?

A: No, he didn't say that, but he was in Europe at the time and he knew that these people were in Europe at the time, also.

Oj Did he indicate to you how he knew that they were in Europe?

A: He didn't give me any indication how he found out, but, apparently, he knew what was happening at the time due to his position ..,173

Thus, Herrman said Nagashian told him that the deal was negotiated in Paris in the Fall of

1980 (probably September or October), and that the participants in the negotiations were Mohammed Beheshti, Albert Hakim, Rafsanjani and Mohsen Rafiqdust for the Iranians and William Casey, Richard Allen and Bud McFar lane for the Reagan Campaign. 174

Task Force counsel asked Herrmann whether he told anyone about the Nagashian conversa tion contemporaneously. Herrmann said that he confidentially advised the CIA of the infor mation obtained from Nagashian. Having told the government his tale, Herrmann said that he felt no other responsibility to raise the subject elsewhere. 175

The Task Force was concerned about Herr mann's connection to Richard Brenneke who had been shown to be untruthful. The Task Force questioned Herrmann about how he had surfaced as an October Surprise witness. Herrmann was evasive about his contacts with Richard Brenneke and Barbara Honneger.176 This evasiveness led the Task Force to question Herrmann's veracity:

Oj During this time period did you have contact with Barbara Honegger herself?

A: Yes, she contacted me before her book was published. That is how I got in there. How she got my name was through London, I believe, if I recall correctly.

Oj You see, that strikes me as odd. How would she get your name through London? What happened in

Joint Report of the Task Force to Investigate Certain Allegations Concerning the Holding of American Hostages by Iran in 1980 ("October Surprise Task Force")

London that she could possibly get your name?

A: Because of the publicity I re ceived.

Qj What publicity did you receive with respect to October Surprise-relat ed activities?

A: None. None.

Oj So how did she get your name?

A: I don't know. It could have been through Brenneke. I don't know.

Oj Well, how did Brenneke get your name? You say maybe through Bren neke. How would Brenneke have gotten your name to tie you into the October Surprise to get you to Bar bara Honegger if you have not gone public with any statements about Oc tober Surprise-related activities?

A: I don't know. I don't know. Oj Did you ask Brenneke that? A: No Ididn't.

OjImean

A: As I said, I don't want to know. I don't want to get involved.

Oj But it is quite a puzzle. I mean, here you have remained silent about this October Surprise matter, and then all of a sudden two people, Brenneke and Honegger, are calling you up and saying, I hear you have information relevant to October Surprise. It would strike me the first question out of my mouthiswhatareyoutalkingabout.

And if it wasn't, why would you choose to go public with them for the first time; Brenneke, a person about whom you felt was less than honest; and Honegger, a person you didn't know? Why would you do that?

A: Well, as I said, I didn't know Brenneke either. I had never met the man personally, and, you know, Bren nekeisverygoodwithcollectinginfor mation, whether it is through newspa pers, news media or whatever, and

maybe he picked up my name through the news media. I don't know.

Oj But your name isn't in the news media relating to October Surprise.

A: I know that. I know that. OjSohowcouldhepickitup? A:Idon'tknow ...177

Herrmann's answers were disingenuous, at best. At worst he completely fabricated his knowledge of and participation in the October Surprise allegations. It is difficult to believe that Herrmann was contacted out of the blue by Honegger or Brenneke. It seems more likely that he affirmatively sought them out from his prison cell in an effort to insinuate himself into the October Surprise theory in much the same way as did Oswald LeWinter and others. Herr mann might also have been motivated by a desire for revenge against the United States Government or for a shorter prison sentence. In any case, Herrmann's story is factually flawed, especially in light of the CIA contact report and the testimony of Nagashan, dis cussed below.

The Task Force spoke with the CIA agent who Herrmann contacted. The agent indicated that during late 1981 or early 1982, FBI's Newark office advised the CIA that William Herrmann with various offenses, including smuggling and theft of motor vehicles. As a result of these charges, Herrmann determined that it was in his best interests to cooperate with the U.S. Government. Among other things, he made statements concerning Iraq. The FBI notified the CIA of Herrmann's coop eration and suggested that an interview con cerning the international matters he had raised should be arranged.178

A CIA agent was assigned to contact Herr mann and evaluate his utility as an intelligence source. Background checks revealed that Herr mann had been arrested on several other occa sions, in addition to his current charges. As a result, the CIA concluded that Herrmann would not be a useful source.179 During the ini tial screening process, however, Herrmann fre quently telephoned the agent to volunteer in formation. Most of the information was vague and unusable. The agent characterized Herr mann as elusive and hard to pin down. He indi

Joint Report of the Task Force to Investigate Certain Allegations Concerning the Holding of American Hostages by Iran in 1980 ("October Surprise Task Force")

cated that Herrmann only provided information on Iraq, and was only able to produce a list of arms requirements from the Iraqi Ministry of Defense. According to the agent, Herrmann never discussed Iran or the October Surprise allegations.180

The agent's last conversation with Herrmann occurred just before the holidays, when Herr mann was to report to Leavenworth Penitentia ry. Herrmann was desperate to avoid incarcer ation. He said he would do anything for the United States Government, including being air dropped into the Soviet Union. The agent con sidered Herrmann to be an unreliable source and the Agency did not rely on him.

Finally, without success, the Task Force in vestigated the relationship among Herrmann, Brenneke and Honegger.

Given Herrmann's implausible statements re garding his contacts with the CIA, his failure to bring these allegations to the attention of law enforcement authorities and the CIA at the time he faced incarceration, and his contacts with Brenneke and Honegger, the Task Force considered his testimony to be untruthful. In addition, as demonstrated below, testimony of Hamid Nagashan further undercuts Herrmann's testimony.

WILLIAM J. HERRMANN

Ran management consulting firm

William J. Herrmann, 77, of Beverly Hills, a management consultant, died of cancer Tuesday, July 2, 1996, in Windmere Nursing Home in West Bloomfield.

Mr. Herrmann, a University of Michigan graduate, was in the Navy in World War II.

After his discharge, he worked for Dura Corp. and Vickers Corp. In 1966, he founded Birmingham Consultants.

Survivors include a daughter, Nancy H. Wind; a son, William; and three grandchildren.

Visitation will be from 2-4 p.m. and 6-8:30 p.m. Friday in the A.J. Desmond and Sons Funeral Home, 4375 N. Woodward, Royal Oak.

A memorial service will be held at 11 a.m. Saturday in the chapel of First Presbyterian Church, 1669 W. Maple, Birmingham. Burial will be in Acacia Park Cemetery in Birmingham.

Memorials may be sent to the Michigan Cancer Foundation, 110 E. Warren, Detroit, Mich. 48002.

David L. Heymann (born 1946) is an American infectious disease epidemiologist and public health expert, based in London.

Early life and education[edit]

Heymann was born in Pennsylvania, USA. He received his Bachelor of Arts from Pennsylvania State University and later obtained an MD from Wake Forest University School of Medicine. He also received a Diploma in Tropical Medicine and Hygiene from the London School of Hygiene and Tropical Medicine. Heymann did two years of practical epidemiology training with the Epidemic Intelligence Service (EIS). Whilst an EIS officer, he was part of the international team that investigated the first outbreak of Ebola in Zaire (with Peter Piot, Karl Johnson, Joel Breman, Joe McCormick amongst others) and the first outbreak of Legionnaire's Disease, in Philadelphia.

Career[edit]

Heymann was appointed Chairman of the Board of the UK Health Protection Agency (HPA) in April 2009. He remained Chairman of the Board when HPA was merged into Public Health England (PHE) in 2013. At the same time, he started and became Head and Senior Fellow of the Centre on Global Health Security at Chatham House, London (the Royal Institute of International Affairs) and in 2010 joined the faculty at the London School of Hygiene and Tropical Medicine as Professor of Infectious Disease Epidemiology.[1]

Heymann was the World Health Organization's (WHO) Assistant Director-General for Health Security and Environment, and the representative of the Director-General for polio eradication. Previously, from 1998–2003, he was Executive Director of the WHO Communicable Diseases Cluster and from October 1995 to July 1998 he was Director of the WHO Programme on Emerging and other Communicable Diseases. Prior to this, he was the chief of research activities in the WHO Global Programme on AIDS.

Heymann was also chairman of the Strategic Advisory Group of Hilleman Laboratories.

Heymann is Visiting Professor in the Department of Medicine at the National University of Singapore, and an Associate Provost (Health Affairs).

Before joining WHO, Heymann worked for 13 years as a medical epidemiologist in sub-Saharan Africa on assignment from the US Centers for Disease Control and Prevention (CDC). He also worked in India for two years as a medical epidemiologist in the WHO Smallpox Eradication Programme, where smallpox was eradicated in 1978. Heymann also took an active role in the first Ebola outbreak in 1976, and led the response team during the 1995 Kikwit outbreak. In 2003, Heymann was at the forefront of the SARS epidemic, working with his team to mediate international effort to halt the pandemic.[2][3]

For his work in public health, Heymann is regarded as one of the "Disease Cowboys".[4]

Heymann has also served as editor of the 18th through 20th editions of the Control of Communicable Diseases Manual, a publication of the American Public Health Association.

On 5 August 2020, Heymann was deployed as part of a WHO "surge team" in South Africa to help strengthen the national and provincial responses to COVID-19.[5]

2012 (Nov) - U.S. SECURITIES AND EXCHANGE COMMISSION - Litigation Release No. 22552 / November 30, 2012 - Accounting and Auditing Enforcement Release No. 3481 / November 30, 2012 Securities and Exchange Commission v. China North East Petroleum Holdings Limited, et al., Civil Action No. 12-CV-8696 (U.S. District Court for the Southern District of New York)

[HG00BE][GDrive]

SEC FILES FRAUD CHARGES AGAINST CHINA NORTH EAST PETROLEUM HOLDINGS LIMITED; ITS CEO, PRESIDENT AND FORMER CHAIRMAN; ITS FOUNDER AND FORMER DIRECTOR; AND ITS VICE PRESIDENT AND SECRETARY

The Securities and Exchange Commission today announced that, on November 29, 2012, the Commission filed fraud and other related charges against **China North East Petroleum Holdings (CNEP)**; its CEO, President and former Chairman of the Board of Directors, Wang Hongjun (Wang); its founder, former director and Wang's mother, Ju Guizhi (Ju); and its Vice President of Corporate Finance and Secretary, Jiang Chao. The Commission also named Wang's wife, Sun Jishuang (Sun), and Jiang Chao's father, Jiang Mingfu, as Relief Defendants to recover company monies that they improperly received.

The Commission alleges that CNEP, Wang, Ju and Jiang Chao diverted offering proceeds to the personal accounts of corporate insiders and their immediate family members, and also engaged in fraudulent conduct in connection with at least 176 undisclosed transactions between the company and its insiders or their immediate family members, otherwise known as related-party transactions.

The Commission alleges that, in connection with its two public stock offerings in late 2009, CNEP falsely stated to investors in a registration statement and other public filings signed by Wang that the offering proceeds would be used to fund future business expansion and for general working capital purposes. Instead, consistent with a pre-existing pattern of engaging in undisclosed, related-party transactions, Jiang Chao then diverted over $900,000 of offering proceeds to his father, Jiang Mingfu, and at the direction of Ju, diverted at least $6 million dollars to her and Sun, who is her daughter-in-law and Wang's wife.

The Commission further alleges that during 2009, CNEP, Wang and Ju engaged in at least 176 undisclosed, related-party transactions. This fraudulent conduct involved approximately $28 million in transactions from CNEP to Wang or Ju; approximately $11 million purportedly loaned to CNEP or paid to third parties on behalf of CNEP by Wang or Ju; and $20 million of unusual post-year-end adjustments that purported to eliminate the remaining debts owed by Wang and Ju to CNEP. Together, these transactions totaled approximately $59 million of related-party activity during 2009. Neither the magnitude nor the volume of these related-party transactions has been fully disclosed to the investing public.

The Commission alleges that CNEP, Wang, Ju and Jiang Chao violated the antifraud provisions of the securities laws, Section 17(a) of the Securities Act of 1933 and Section 10(b) of the Exchange Act of 1934 (Exchange Act) and Rule 10b-5. The Commission further alleges violations of reporting, recordkeeping and internal controls provisions of the securities laws, Sections 13(a), 13(b)(2)(A) & (B), and 13(b)(5) of the Securities Exchange Act and Rules 13a-1, 13a-11, 13a-13 and 13b2-1. The Commission is seeking: (i) permanent injunctive relief to prevent future violations of the federal securities laws, disgorgement of ill-gotten gains with prejudgment interest, and civil penalties from each Defendant; (ii) officer and director bars against Wang, Ju and Jiang Chao; and (iii) disgorgement from the Relief Defendants, Sun and Jiang Mingfu, of improperly received funds.

The investigation is continuing.

2015 (Sep 10) - SEC Announces Fraud Charges in Cross-Border Scheme to Secretly Control and Manipulate Stock of Chinese Companies After Reverse Mergers

[HG00BF][GDrive] / Actual filing PDF here : https://www.sec.gov/litigation/complaints/2015/comp-pr2015-189.pdf (any connection to this from 2013 - https://www.sec.gov/litigation/opinions/2013/34-69968.pdf ?) 1983 .. Uchimoto worked at SEC - https://www.sec.gov/news/digest/1983/dig083083.pdf / (also see https://www.sec.gov/rules/proposed/2010/34-61414.pdf , uchimoto was proposing SEC legislation in 2003 ...)

Washington D.C., Sept. 10, 2015 — The Securities and Exchange Commission today announced fraud charges against a Wall Street CEO and his company, family members, and business associates accused of secretly obtaining control and manipulating the stock of Chinese companies they were purportedly guiding through the process of raising capital and becoming publicly-traded in the United States.

The SEC alleges that **Benjamin Wey and New York Global Group (NYGG)** typically structured reverse mergers between clients and publicly-traded shell companies in such a way that he and other family members secretly obtained ownership interests of more than five percent of the newly listed companies. To avoid detection and evade SEC reporting requirements as beneficial owners, they divided their shares among a vast network of foreign accounts and generated tens of millions of dollars in illegal profits as they sold the securities into artificially inflated markets. The illicit profits eventually circled back to Wey and his wife, who used the money to finance a lavish lifestyle.

Also charged in the case in addition to Benjamin Wey and NYGG are his wife Michaela Wey and sister Tianyi Wei, their Switzerland-based broker Seref Dogan Erbek, and two attorneys Robert Newman and William Uchimoto.

In a parallel action, the U.S. Attorney's Office for the Southern District of New York today announced criminal charges against Benjamin Wey and Dogan Erbek.

"We allege that when the Weys and NYGG were supposed to be helping Chinese companies go public in the U.S., they were secretly obtaining control of blocks of their clients' shares so they could manipulate the markets and derive illegal profits. The Weys and their attorneys went to extraordinary lengths to hide their scheme, but they underestimated our ability to piece it together," said Antonia Chion, Associate Director of the SEC's Division of Enforcement."

The SEC's complaint alleges violations or the aiding and abetting of violations of the antifraud provisions and the disclosure and reporting provisions of the federal securities laws.

The SEC's investigation was conducted by Patrick L. Feeney and Steven A. Susswein, and supervised by Melissa Hodgman. The litigation will be led by Cheryl L. Crumpton, Joshua Braunstein, and Derek Bentsen. The SEC appreciates the assistance of the Federal Bureau of Investigation, U.S. Attorney's Office for the Southern District of New York, Financial Industry Regulatory Authority, Securities and Futures Commission of Hong Kong, Monetary Authority of Singapore, Ontario Securities Commission, and British Columbia Securities Commission.

[NOTE - These charges were voluntarily dismissed on Sep 1, 2017 - https://www.sec.gov/litigation/litreleases/2018/lr24105.htm]

2016 (Oct 14) - SEC - Melissa Hodgman Named Associate Director in SEC Enforcement Division

[HG00BG][GDrive]

Washington D.C., Oct. 14, 2016 — The Securities and Exchange Commission today announced that Melissa Hodgman has been named Associate Director in the SEC's Enforcement Division. Ms. Hodgman succeeds Stephen L. Cohen, who left the SEC in June.

Ms. Hodgman began working in the Enforcement Division in 2008 as a staff attorney. She joined the Market Abuse Unit in 2010 and was promoted to Assistant Director in 2012.

Ms. Hodgman has investigated or supervised dozens of enforcement recommendations spanning a variety of misconduct, including:

- The SEC's first case against a brokerage firm for failing to file SARs when appropriate.
- Fraud charges against a Wall Street CEO and his company, family members, and business associates accused of secretly obtaining control and manipulating the stock of Chinese companies they were purportedly guiding through the process of raising capital and becoming publicly-traded in the United States.
- Fraud and other related charges against China North East Petroleum Holdings, its CEO, President and former Chairman of the Board of Directors, and others arising from their alleged diversion of offering proceeds to the personal accounts of corporate insiders and their immediate family members and fraudulent conduct in connection with at least 176 undisclosed related-party transactions.
- Charges against Charles Schwab Investment Management, Charles Schwab & Co., and two executives for making misleading statements regarding the Schwab YieldPlus Fund and failing to establish, maintain and enforce policies and procedures to prevent the misuse of material, nonpublic information.

Ms. Hodgman has led the Enforcement Division's Cross-Border Working Group, which provides expertise and assistance of matters with international actors and implications. Ms. Hodgman also co-founded and served as the enforcement representative on the Chair's Attorney Honors Program, and is a member of the Enforcement Division's hiring committee at its Washington D.C. headquarters.

"Melissa has supervised and investigated a broad range of noteworthy and first-of-their-kind cases across the spectrum of the securities industry and involving misconduct located around the world," said Andrew J. Ceresney, Director of the SEC's Enforcement Division. "She has distinguished herself with her excellent judgment and creativity, and I am pleased to have her join the senior ranks of the Enforcement Division."

Ms. Hodgman said, "I am honored by this appointment and look forward to continuing our tradition of pursuing tough but fair enforcement actions in complex and cutting-edge cases, especially matters involving cross-border issues and efforts to hold gatekeepers accountable for breaches of their professional standards." original:

During the 2016 US presidential election, this report notes, both Peter P. Strzok II and Melissa R. Hodgman played "key/central" roles as Hillary Clinton operatives within the American "Deep State"—with then FBI Director James Comey stating that his team, led by Peter P. Strzok II, "moved heaven and earth" to finish their review of Hillary Clinton's e-mails in time for him to reveal on Sunday, 7 November, less than 48 hours before the election, and that they had found nothing incriminating—while at the same time, Melissa R. Hodgman (who had been appointed by the Obama regime as an Associate Director in the SEC Enforcement Division on 14 October 2016) filed US Federal charges against a lawyer named William Uchimoto (the son of Dan Uchimoto who was one of the most decorated Japanese American soldiers in World War II).

The Hillary Clinton "Deep State" attack upon William Uchimoto, this report explains, was due to his investigating a Georgetown University law professor named Chris Bummer for his money laundering ties to the Clinton Foundation—but with all of the "fake charges" leveled against him by Melissa R. Hodgman being thrown out of court by US Federal Judge P. Kevin Castel this past March (2017).

2017 (March 10) - SEC Charges Firms Involved in Layering, Manipulation Schemes

Source - [HG00BI][GDrive]

Washington D.C., March 10, 2017 — The Securities and Exchange Commission today announced fraud charges against a Ukraine-based trading firm accused of manipulating the U.S. markets hundreds of thousands of times and the New York-based brokerage firm and CEO who allegedly helped make it possible.

The SEC's complaint alleges that Avalon FA Ltd touted itself to traders as a destination to engage in layering, a scheme in which orders are placed but later canceled after tricking others into buying or selling stocks at artificial prices, resulting in illicit profits. Avalon allegedly made more than $21 million in the layering scheme involving U.S. stocks during a five-year period. According to the SEC's complaint, Avalon also made more than $7 million in illicit profits through a cross-market manipulation scheme in which the firm bought and sold U.S. stocks at a loss in order to manipulate the prices of the stock and its corresponding options so that it could then profitably trade at artificial prices. Avalon allegedly used traders in Eastern Europe and Asia to conduct its trading, and the firm kept a portion of the profits and collected commissions from the traders.

The SEC's complaint also describes fraud charges against Avalon's named owner Nathan Fayyer and Sergey Pustelnik, who allegedly kept his controlling interest in Avalon undisclosed and embedded himself at Lek Securities as a registered representative, using his position to facilitate the schemes.

The SEC further alleges that Lek Securities and its owner Samuel Lek made the schemes possible by providing Avalon with access to the U.S. markets, approving the cross-market trading scheme, and improving its trading technology to assist Avalon's trading. According to the SEC's complaint, Lek Securities also relaxed its layering controls after Avalon complained. Avalon was the highest-producing customer for Lek Securities in terms of trading commissions, fees, and rebates generated.

"As alleged in our complaint, Avalon openly marketed itself as a destination for manipulative trading, and Lek Securities opened the gate to allow the schemes into the U.S. markets despite repeated warnings that its customer was manipulating the market," said Stephanie Avakian, Acting Director of the SEC's Division of Enforcement.

After filing its complaint in U.S. District Court for the Southern District of New York, the SEC obtained an emergency court order freezing Avalon's assets held in its account at Lek Securities as well as freezing and repatriating funds that Avalon has transferred overseas.

The SEC's investigation was conducted by Sarah S. Nilson along with Owen A. Granke and Carolyn Welshhans of the Market Abuse Unit. The case was supervised by Melissa Hodgman, Antonia Chion, and Robert A. Cohen. The litigation will be led by David J. Gottesman, Olivia S. Choe, and Ms. Nilson. The SEC appreciates the assistance of the Financial Industry Regulatory Authority.

2018 (April 05) - OANN video - Pa. Attorney: Wife of Peter Strzok was Unfair to Asian-American Businessmen

A Philadelphia attorney is speaking out against the wife of embattled FBI Agent Peter Strzok. The lawyer says Securities and Exchange Commission attorney Melissa Hodgman unfairly targeted a group of Asian-American businessmen and women. One America's Neil W. McCabe has more from Washington.

2019 (Sep 23) - SEC Charges Nissan, Former CEO, and Former Director with Fraudulently Concealing from Investors More Than $140 Million of Compensation and Retirement Benefits

Source : [HG00BL][GDrive] / PDF of Judgement : [HG00BM][GDrive]

Litigation Release No. 24606 / September 23, 2019

Accounting and Auditing Release No. 4088 / September 23, 2019

Securities and Exchange Commission v. Carlos Ghosn and Gregory L. Kelly, No. 1:19-civ-08798 (S.D.N.Y. filed September 23, 2019)

Washington D.C., Sept. 23, 2019 - The SEC today filed settled fraud charges against Nissan, its former CEO Carlos Ghosn, and its former director Greg Kelly related to false financial disclosures that omitted more than $140 million to be paid to Ghosn in retirement.

According to the SEC's orders and complaint, beginning in 2004 Nissan's Board delegated to Ghosn the authority to set individual director and executive compensation levels, including his own. From 2009 until his arrest in Tokyo in November 2018, Ghosn, with substantial assistance from Kelly and subordinates at Nissan, engaged in a scheme to conceal more than $90 million of compensation from public disclosure, while also taking steps to increase Ghosn's retirement allowance by more than $50 million. Each year, Ghosn fixed a total amount of compensation for himself, with a certain amount paid and disclosed and an additional amount that was unpaid and undisclosed. Ghosn and his subordinates, including Kelly, crafted various ways to structure payment of the undisclosed compensation after Ghosn's retirement, such as entering into secret contracts, backdating letters to grant Ghosn interests in Nissan's Long Term Incentive Plan, and changing the calculation of Ghosn's pension allowance to provide more than $50 million in additional benefits. Kelly and Ghosn's Nissan subordinates misled Nissan's CFO, and Nissan issued a misleading disclosure in connection with the increased pension allowance. The $140 million in undisclosed compensation and retirement benefits was never paid out to Ghosn.

In an administrative proceeding, the Commission charged Nissan with violating the anti-fraud provisions of Section 10(b) of the Securities Exchange Act of 1934 and Rule 10b-5 thereunder. Nissan settled the charges, agreeing to pay a $15 million civil penalty and to cease and desist from committing or causing violations of the anti-fraud provisions. The SEC's complaint filed in district court charges Ghosn with violating the same anti-fraud provisions and Kelly with aiding and abetting Ghosn's and Nissan's violations. To settle the charges, Ghosn and Kelly agreed to be permanently enjoined from violating or aiding and abetting violations of the anti-fraud provisions. Ghosn also agreed to a $1 million civil penalty and a 10-year officer and director bar. Kelly agreed to a $100,000 penalty, a five-year officer and director bar and a five-year suspension from practicing or appearing before the Commission as an attorney. Nissan, Ghosn, and Kelly settled without admitting or denying the SEC's allegations and findings.

The SEC investigation was conducted by Brad Ney and Christian Schultz, with assistance from Jamie Wohlert, Richard Haynes and Sandhya Harris. The case was supervised by Tim England and Melissa Hodgman. The SEC would like to thank the Tokyo District Public Prosecutors Office for its assistance in connection with this investigation.

2019 (Oct 10) - SEC Obtains Sanctions Against Lek Securities and CEO, Including Bar Against CEO

Litigation Release No. 24639 / October 10, 2019 / Source : [HG00BK][GDrive] / PDF of court filings : [HG00BN][GDrive]

Securities and Exchange Commission v. Lek Securities Corp., et al., No. 17-cv-1789 (S.D.N.Y. filed March 10, 2017)

On October 1, 2019, a federal court judge entered final judgments against New York-based brokerage firm Lek Securities Corp. and Chief Executive Officer Sam Lek, who were charged by the Securities and Exchange Commission with facilitating manipulative U.S. trading by a Ukraine-based firm over a three-year period.

The SEC's complaint, filed in March 2017, alleged that Lek Securities and Sam Lek helped facilitate manipulative trading schemes by its customer, Avalon FA Ltd., headquartered in Kiev. According to the complaint, Avalon illegally profited from layering, which involved placing and canceling orders to trick others into buying or selling stocks at artificial prices, and cross-market manipulation, which involved buying or selling stocks to artificially impact options prices. The SEC's complaint alleged that Lek Securities and Sam Lek made the schemes possible by giving Avalon access to the U.S. markets, relaxing the brokerage firm's layering controls after Avalon complained, allowing Avalon to conduct the trading activity, and improving Lek Securities' technology to assist Avalon's trading.

The Honorable Denise L. Cote for the U.S. District Court for the Southern District of New York entered the final judgments by consent. Lek Securities agreed to a three-year injunction requiring it to terminate business with foreign customers potentially engaged in market manipulation or manipulative trading and largely prohibiting it from providing intra-day trading to foreign customers. Lek Securities also agreed to retain an independent compliance monitor for a three-year period and, along with Sam Lek, agreed to permanent injunctions from violating the antifraud and manipulative trading provisions of Sections 9(a)(2) and 10(b) of the Securities Exchange Act of 1934 and Rule 10b-5 thereunder, and Section 17(a) of the Securities Act of 1933. Lek Securities will pay a $1 million penalty, plus $525,892 in disgorgement and prejudgment interest, and Sam Lek will pay a $420,000 penalty.

Lek Securities also agreed to a censure, and Sam Lek agreed to associational and penny stock bars with a right to reapply after ten years. In settling the SEC's charges, Lek Securities and Sam Lek admit that as alleged in the SEC's complaint, Avalon's trading activity through Lek Securities constituted violations of the federal securities laws.

The litigation, which is being handled by David J. Gottesman, Olivia S. Choe, and Sarah S. Nilson, is continuing against Avalon and individuals associated with it. The SEC's investigation was conducted by Ms. Nilson, Owen A. Granke, and Carolyn Welshhans, and supervised by Melissa R. Hodgman and Antonia Chion.

2021 (Jan 22) - SEC - Melissa Hodgman Named Acting Director of Division of Enforcement

[HG00BH][GDrive]

Washington D.C., Jan. 22, 2021 — The Securities and Exchange Commission today announced Melissa R. Hodgman, currently an Associate Director in the Commission's Division of Enforcement, has been named Acting Director of the Division of Enforcement.

"Melissa's dedication to investor protection, broad experience in the Division, and proven track record of collaboration and creative problem solving make her ideally suited to this role," said SEC Acting Chair Allison Herren Lee. "As Associate Director, Melissa has overseen a wide range of complex and programmatically important matters, and has been a leading voice in the Division on critical issues of diversity, hiring, and labor-management relations. She is highly respected by her colleagues in the Division and across the agency for her intellect and dedication."

"It has been my honor to serve with the incredibly talented staff across the Division of Enforcement for over a decade," said Ms. Hodgman. "I am constantly inspired by the dedication of my colleagues in the Division and across the Commission, especially with the challenges of the last year. I look forward to continuing my work with them in the role of Acting Director and supporting the Commission's mission of protecting investors and market integrity through the aggressive pursuit of all forms of fraud and misconduct in our markets."

Ms. Hodgman has been Associate Director in the Home Office since October 2016. She has investigated and led teams pursuing and litigating numerous enforcement actions covering the spectrum of securities law violations, including matters related to financial fraud and disclosure; broker-dealers, investment advisers, and gatekeepers; offering frauds, market structure, and manipulation; and cross-border and FCPA violations. The notable cases to which Ms. Hodgman has contributed include:

- Successful litigation against two Ukraine-based traders, Nathan Fayyek and Sergey Pustelnik, who, along with their trading firm, were found liable for a multi-pronged manipulative trading scheme, and against Lek Securities, the U.S. based broker-dealer the Commission alleged helped to facilitate their trading, and its principal, Samuel Lek, who settled just prior to trial.
- A $50 million settlement with Big 4 accounting firm KPMG to settle charges relating to the firm's receipt and use of PCAOB inspection information as well as misconduct related to internal training exams. In addition to the settlement with the firm, the Commission charged eight KPMG officials for their roles.
- Actions against Nissan Corporation and its former CEO Carlos Ghosn and director Greg Kelly in connection with a scheme to conceal from public disclosure tens of millions of dollars of expected compensation for Ghosn. Nissan agreed to pay a $15 million civil penalty, and Ghosn and Kelly were barred from acting as officers or directors of public companies, in addition to paying significant civil penalties.
- Enforcement actions against several individuals and entities responsible for the Fyre Festival including Fyre Festival CEO William Z. (Billy) McFarland, who admitted to his role in a fraudulent scheme that raised more than $27 million from over 100 investors.
- Investigation of the Schwab YieldPlus Fund for misconduct related to the 2008 financial crisis that resulted in a $118 million settlement with broker dealer Charles Schwab & Co, and related entities where the SEC found that the YieldPlus Fund misstated the risk associated with its portfolio. The Commission also brought litigated charges against two senior executives.

Ms. Hodgman has also played key roles in numerous Commission initiatives, including t**he creation and leadership of the Division's Covid-19 Steering Committee** and overseeing the Division's Financial Reporting and Audit Group. She has been a leader in the Division's diversity and inclusion work during her career, including as the head of the Division's Hiring Committee, Executive Sponsor of the agency's Women's Committee, and as a member of the Division's Labor and Management Forum at both the local and national levels.

Ms. Hodgman began working in the Enforcement Division in 2008 as a staff attorney. She joined the Market Abuse Unit in 2010 and was promoted to Assistant Director in 2012. She received the Ellen B. Ross Award, the 2010 SEC Chairman's Award, the 2017 Arthur F. Mathews Award, and the 2020 Chairman's Award for Excellence with the SEC's Employee Affinity Groups, as well as a number of Division Director Awards. [...]

TRIBUTE TO MAJOR GENERAL BARBARA R. HOLCOMB

Mr. DAINES. Mr. President, today I wish to honor MG Barbara R. Holcomb for her 32 years of service in our Armed

Forces, most notably, as the first fe- male commanding general at the U.S. Army Medical Research and Develop- ment Command at Fort Detrick and chief of the U.S. Army Nurse Corps. Major General Holcomb grew up in the small town of Miles City, MT, and joined the Army Reserve Officer Train- ing Corp, ROTC, following her first year of nursing school at Seattle Uni- versity. She completed her education as a distinguished military graduate with a bachelor of science in nursing. She continued her exceptional career with service to our country and contin- ued Montana's proud heritage of mili- tary service and firsts in female leader- ship.

Major General Holcomb goes above and beyond as a leader and, as such, was chosen to speak at the 2018 Women in Leadership Summit at the Aberdeen Proving Ground. She shared her experi- ence in finding balance as a leader and the importance of a leader getting to know themselves and their peers. Even though she was not allowed to serve in a battalion commander position as a cadet in ROTC, she became a com- mander as a captain and commanded at every rank thereafter. It is this com- mitment to strong leadership and per- sonal growth that has led her to a long and successful career in the Army and distinguishes her as an exceptional Montanan.

It is not without good reason that Major General Holcomb has received many awards, including a Distin- guished Service Medal, Bronze Star, and membership in the Order of Mili- tary Medical Merit. Between her focus on the personal, human aspect of healthcare, her commitment to contin- ued education, and the selfless passion with which she serves her country, Major General Holcomb embodies what it means to be an outstanding leader and individual.

Upon her retirement, the U.S. Army will be losing one of their most valu- able assets; however, the example of leadership that she has set for so many will leave a lasting impact on the qual- ity of this nation's Army Nurse Corps and, consequentlv, the quality of care that our Nation's soldiers will receive. Montana is proud to call her one of our own.

I would like to recognize Major Gen- eral Barbara R. Holcomb, her personal accomplishments, and contributions to this country.

First nurse takes command at Landstuhl

Col. Barbara R. Holcomb, the incoming commander of the Landstuhl Regional Medical Center, left, takes the LRMC colors from Brig. Gen. Nadja Y. West,

commander of the Europe Regional Medical Command, at a change of command ceremony in Landstuhl, Germany, Thursday. Holcomb took command from Col. Jeffrey B. Clark, who is slated to replace West at ERMC.

By NANCY MONTGOMERY | STARS AND STRIPES Published: May 3, 2012

LANDSTUHL, Germany — Throughout Landstuhl Regional Medical Center's long, storied past, medical doctors have almost always been in charge.

But on Thursday, Col. Barbara Holcomb became the first registered nurse – and second woman – to take command of the hospital, considered a jewel in the crown of military medicine.

" 'Landstuhl is such an awesome place,' " Holcomb, in her change-of command ceremonial speech, recalled a friend telling her when she got the news of her assignment. " 'They saved several of my soldiers.' "

Such admiration for the hospital staff's expertise at saving the lives of wounded troops "runs deeply through many military leaders," Holcomb said. "This is indeed an honor."

ADVERTISING

Holcomb relieves Col. Jeffrey Clark, who served less than a year before being nominated for promotion to brigadier general and, next month, to take over as commander of the Europe Regional Medical Command. Clark will replace Brig. Gen. Nadja West, who is to become an assistant Army surgeon general.

Clark told those assembled for the ceremony – a group that included, as the hospital does in its 3,000-person staff, servicemembers from all four branches, civilians, Germans and a variety of other U.S. allies – that it had been an honor to be their commander.

"Landstuhl will change a person," he said. "There's something special about the place and the people who serve here."

The outgoing commander of the Landstuhl Regional Medical Center, Col. Jeffrey B. Clark, speaks at the change of command ceremony at Landstuhl, Germany, Thursday. He relinquished command to Col. Barbara R. Holcomb.
MICHAEL ABRAMS/STARS AND STRIPES

Clark said that although numerous, admiring luminaries have continuously passed through the hospital, the praise that meant most to him came from a Canadian warrant officer assigned there.

"I have two sons serving in the Canadian army," the warrant officer told Clark. "What Landstuhl does is provide comfort for mothers like me."

The hospital opened in 1953, part of the huge U.S. military presence after World War II and through the end of the Cold War. Today, it is the only U.S. military hospital remaining in Europe.

More than 62,000 wounded troops from Iraq and Afghanistan have been treated at Landstuhl over the past 11 years. More than 99 percent of them have survived.

The hospital is expected to stay busy with combat casualties for at least the next two years, when the U.S. withdraws most of its troops from Afghanistan.

The hospital, which also does clinical research and delivers about three babies a day, has received numerous awards, certifications and verifications, not only for its unparalleled trauma care. Landstuhl was also named best hospital in overall care throughout the military and veterans' hospital system by a military surgeons association.

"Landstuhl is a commander's dream," said Clark, a family practice doctor with 28 years in the Army, who hasn't practiced clinically for the past several years. "We think, wouldn't it be great if, one day, I could command Landstuhl?"

article continues below

related articles

Landstuhl is Level I trauma center, 1st outside U.S.

Every Landstuhl commander in the past decade has been subsequently selected to be a general officer.

Holcomb, a 1987 ROTC graduate of Seattle University, has previously made nursing history. She was also one of the first two nurses to command a Combat Support Hospital – the 21st CSH, out of Fort Hood, Texas, which deployed to Iraq in 2010.

Having a nurse in command of Landstuhl for the first time is a testament to "the increased responsibility given to the Nurse Corps," said Landstuhl spokeswoman Marie Shaw.

In fact, the Army surgeon general, Lt. Gen. Patricia Horoho, is also a registered nurse, the first nurse – and the first woman – ever selected for the job.

At the ceremony, West, Clark and Holcomb all lauded a non-medic who provided a highlight: Air Force Tech. Sgt. Craig Bowman, of the U.S. Air Forces in Europe Band, who sang both the German and U.S. national anthems, a cappella, and with a soulful flourish.

"That was truly remarkable," West said, before Bowman got a huge round of applause.

The Hot Zone: A Terrifying True Story is a best-selling 1994 nonfiction thriller by [**Richard McCann Preston (born 1954)**] about the origins and incidents involving viral hemorrhagic fevers, particularly ebolaviruses and marburgviruses.[1][2] [See **1967 Marburg virus outbreak in West Germany**.] The basis of the book was Preston's 1992 New Yorker article "Crisis in the Hot Zone".[3]

The filoviruses—including Ebola virus, Sudan virus, Marburg virus, and Ravn virus—are Biosafety Level 4 agents, extremely dangerous to humans because they are very infectious, have a high fatality rate, and most have no known prophylactic measures, treatments, or cures. Along with describing the history of the devastation caused by two of these Central African diseases, Ebola virus disease and Marburg virus disease, [**Richard McCann Preston (born 1954)**] described a 1989 incident in which a relative of Ebola virus, Reston virus, was discovered at a primate quarantine facility in Reston, Virginia, less than 15 miles (24 km) away from Washington, D.C.

Synopsis

The book is in four sections:

- "The Shadow of Mount Elgon" delves into the history of filoviruses, as well as speculation about the origins of AIDS. [**Richard McCann Preston (born 1954)**] recounts the story of "Charles Monet" (a pseudonym), who might have caught Marburg virus from visiting Kitum Cave on Mount Elgon in Kenya. [Also see **1967 Marburg virus outbreak in West Germany**, regarding the leak where the virus was first seen/identified.] The author describes the progression of the disease, from the initial headache and backache, to the final stage in which Monet's internal organs fail and he hemorrhages extensively in a waiting room in a Nairobi hospital. This part also introduces a promising young physician who became infected with Marburg virus while treating Monet. Nancy Jaax's story is told. Viruses, biosafety levels and procedures were described. The Ebola virus disease outbreaks caused by Ebola virus and its cousin, Sudan virus, are mentioned. [**Richard McCann Preston (born 1954)**] talks to the man who named the Ebola virus.
- "The Monkey House" chronicles the discovery of Reston virus among imported monkeys in Reston, Virginia, and the following actions taken by the U.S. Army and Centers for Disease Control. It starts with the monkey house receiving a shipment of 100 wild monkeys. After four weeks, 29 of these monkeys have died. This is followed by the veterinarian for the facility, Dan Dalgard, examining the dead monkeys and sending the samples to Peter Jahrling, a virologist at United States Army Medical Research Institute of Infectious Diseases. After seeing a rope-like virus under the microscope, it is suspected that the monkeys were infected with a hot agent similar to the Marburg virus. Jahrling then conducts a blood test to find out that the hot agent is the Ebola Zaire virus. This conclusion leads to the Army Medical Research Institute deciding to euthanize all the monkeys in the same room as the infected monkeys. [Note: Also see **1967 Marburg virus outbreak in West Germany**, regarding the leak where the virus was first seen/identified.]
- "Smashdown" is more on the Reston epizootic, which involved a strain of the virus that does not affect humans but which easily spreads by air, and is very similar to its cousin the Ebola virus.
- "Kitum Cave" tells of the author's visit to the cave that is the suspected home of the natural host animal in which Ebola lives.

The book starts with "Charles Monet" visiting Kitum Cave during a camping trip to Mount Elgon in Central Africa. Not long after, he begins to suffer from a number of symptoms, including vomiting, diarrhea and red eye. He is taken to Nairobi Hospital for treatment, but his condition deteriorates further, and he goes into a coma while in the waiting room. This particular filovirus is called Marburg virus.

Dr. Nancy Jaax had been promoted to work in the Level 4 Biosafety containment area at the United States Army Medical Research Institute of Infectious Diseases, and is assigned to research Ebola virus. While preparing food for her family at home, she cuts her right hand. Later, while working on a dead monkey infected with Ebola virus, one of the gloves on the hand with the open wound tears, and she is almost exposed to contaminated blood, but does not get infected. Nurse Mayinga is also infected by a nun and goes to Nairobi Hospital for treatment, where she succumbs to the disease.

In Reston, Virginia, less than fifteen miles (24 km) away from Washington, D.C., a company called Hazelton Research once operated a quarantine center for monkeys that were destined for laboratories. In October 1989, when an unusually high number of their monkeys began to die, their veterinarian decided to send some samples to Fort Detrick (USAMRIID) for study. Early during the testing process in biosafety level 3, when one of the flasks appeared to be contaminated with harmless pseudomonas bacterium, two USAMRIID scientists exposed themselves to the virus by wafting the flask. The virus found at the facility was a mutated form of the original Ebola virus and was initially mistaken for simian hemorrhagic fever virus. They later determine that, while the virus is lethal to monkeys, humans can be infected with it without any health effects at all. This virus is now known as Reston virus.

Finally, the author goes to Africa to explore Kitum Cave. On the way, he discusses the role of AIDS in the present, as the Kinshasa Highway that he travels on was sometimes called the "AIDS Highway" after its early appearance in the region. Equipped with a hazmat suit, he enters the cave and finds a large number of animals, one of which might be the virus carrier. At the conclusion of the book, he travels to the quarantine facility in Reston. He finds the building abandoned and deteriorating. He concludes the book by claiming that Ebola will be back.

Reston virus outbreak

Further information: Reston virus § History

The discovery of the Reston virus was made in November 1989 by Thomas W. Geisbert, an intern at United States Army Medical Research Institute of Infectious Diseases. Dr. Peter B. Jahrling isolated the filovirus further. The Center for Disease Control and Prevention conducted blood tests of the 178 animal handlers. While six tested positive, they did not exhibit any symptoms. The Reston virus was found to have low pathogenicity in humans. This was further supported later when a handler infected himself during a necropsy of an infected monkey, as the handler did not show symptoms of the virus after the incubation period.[4]

Reception

The Hot Zone was listed as one of around 100 books that shaped a century of science by American Scientist.[5] Many reviews of The Hot Zone exemplify the impact the book had on the public's view of emerging viruses. A review in the British Medical Journal captures the paranoia and public panic described in this book. The reviewer was left "wondering when and where this enigmatic agent will appear next and what other disasters may await human primates".[6] This can also be seen in a review in the Public Health Reports which highlights the "seriousness of our current situation" and "our ability to respond to a major health threat".[7]

The Hot Zone is described as a "romantic account of environmental transgression". Reactions to this book could be seen not only in the public's view of

emerging viruses, but in the changes in the Centers for Disease Control and Prevention. In addition to the funding of public health infrastructure during the early 1970s, there were many public discussions of biodefense. This book continued to fuel the emerging diseases campaign. By connecting international health to national security, this campaign used The Hot Zone as a method of justifying increased intervention in the global phenomena of disease.[8]

The Hot Zone elicited a major response by the World Health Organization (WHO) by shedding light on the Ebola Zaire outbreak.[clarification needed] Teams of experts were immediately released.[clarification needed] Many countries tightened their borders, issued warnings to custom officials, quarantined travelers, and issued travel advisories.[9]

In his blurb, horror writer Stephen King called the first chapter "one of the most horrifying things I've read in my whole life".[10] When asked whether any book "scared the pants off you" writer Suzanne Collins answered "The Hot Zone, by Richard Preston. I just read it a few weeks ago. Still recovering."[11]

The Hot Zone has received criticism for sensationalizing the effects of Ebola virus. In their memoir Level 4: Virus Hunters of the CDC (1996),[12] former CDC scientists Joseph B. McCormick and Susan Fisher-Hoch lambasted [**Richard McCann Preston (born 1954)**] for claiming that Ebola dissolves organs, stating that although it causes great blood loss in tissues the organs remain structurally intact. McCormick and Fisher-Hoch also dispute Preston's version of the CDC's actions in the Reston virus incident.[citation needed] In an interview about his book Ebola: The Natural and Human History of a Deadly Virus (2014), David Quammen claimed that The Hot Zone had "vivid, gruesome details" that gave an "exaggerated idea of Ebola over the years" causing "people to view this disease as though it was some sort of preternatural phenomenon".[13]

Dramatizations

Failed film adaptation

In January 1993, 20th Century Fox producer Lynda Obst won a bidding war for the film rights to [**Richard McCann Preston (born 1954)**]'s 1992 New Yorker article, which was still being transitioned into book form.[14] In response to being outbid, Warner Bros. producer Arnold Kopelson immediately began working on a similarly themed production. This competing film, titled Outbreak (and released in March 1995), was only vaguely inspired by Preston's work, but would ultimately be a factor in the collapse of Fox's planned production, Crisis in The Hot Zone.[15]

Directors considered for Crisis in The Hot Zone included Wolfgang Petersen (who would later direct Outbreak), Michael Mann, and Ridley Scott. Scott eventually signed on to direct the film in February 1994.[16] Screenwriter James V. Hart was also signed to adapt the book. In late April 1994, Fox announced they had signed Robert Redford and Jodie Foster to star in the film.[17]

Crisis in The Hot Zone, however, was never made. Foster dropped out of the film just before filming was to begin and production was delayed, with Meryl Streep, Sharon Stone, and Robin Wright touted as possible replacements. In August 1994, Redford also dropped out of the film;[18] a few days after Redford left it was announced that pre-production had been shut down.[19]

Television series

Main article: The Hot Zone (American TV series)

On October 16, 2014, The Hollywood Reporter announced that Ridley Scott again planned to adapt the book, this time as a television miniseries for NatGeo. Kelly Souders, Brian Peterson, and Jeff Vintar wrote the pilot. Julianna Margulies starred as Nancy Jaax. Filming began in September 2018.[20] Lynda Obst again produced the series.[21] The series first aired from May 27 to May 29, 2019,[22] and was later renewed for a second season.

[HC005M][GDrive]

Steve Hotz serves CenterGate® as Chief Scientist, bringing a depth of expertise in networking, operating, and distributed systems, as well as broad skills in the areas of academic research, system evaluation, and project management. His experience in routing protocols, naming and directory services, large-scale and high-performance server systems, and transport protocol design and implementation provides a framework for CenterGate's system development projects. Steve brings eleven years of scientific experience with USC's Information Sciences Institute (ISI) to his leadership position at CenterGate.

Steve's long association with ISI, where he was mentored by [Jon Bruce Postel (born 1943)] and Paul Mockapetris, began in 1988 as a PhD student. He successfully defended his thesis dissertation on Route Computation and Information Organization for Heterogeneous Global Internetworks in 1994, and joined ISI as a research scientist. As a Computer Scientist at ISI, Steve was involved in a number of technical and funding proposals, and was a member of several key research teams.

His first efforts were in the emerging Domain Name System, where he developed tools to evaluate performance and diagnose system misconfigurations. He continued his work on DNS by serving as technical lead of the MINDEX Project, which produced the initial ideas for several DNS mechanisms that were developed within the IETF and are deployed in the 'bind' implementation today, i.e., the notify and the incremental transfer mechanisms. For the past five years, Steve has been the primary technical expert for DNS issues at ISI, including responsibility for technical oversight of the US Domain.

Steve contributed to a diverse set of projects during his tenure at ISI. These included the X-Bone project, an automated system for deploying private overlay networks, the Large Scale Active Middleware (LSAM) project, a system to automatically configure sets of interconnected proxy caches and algorithms to route HTML requests among caches, and the Netstation project, which focused on a system architecture where the system bus is replaced by gigabit LAN technology. As part of Netstation, Steve developed two high-performance transport protocol implementations: a custom Device Transport Protocol (DTP), and a port of TCP to the Netstation operating environment. As part of LSAM, Steve designed a mechanism based on IP multicast to automatically configure a hierarchical system of proxy caches.

Steve worked as a USC Research Assistant with Deborah Estrin from 1991-1994 on projects focusing on inter-domain routing. During this time he was a collaborator in the development of the Unified Routing Architecture, and designed a software simulation tool to generate very large internetwork models for use in research and commercial protocol development.

During his years at USC and ISI, Steve was selected for several visiting researcher and consulting positions. Most recently, he was a Network Systems Consultant to Genuity Inc. where he was the principle architect of their flagship "HopScotch" product and leader of the HopScotch development team. Steve was a Visiting Research Fellow at Bolt, Beranek and Newman, Inc. in the spring of 1994, and spent six months as a research intern with IBM T.J. Watson Research Center, where he designed, evaluated and published a configuration language for administrative policy for the ISO inter-domain routing protocol, IDRP.

Steve has eleven publications and over ten presentations to his credit, as well as several software distributions, including the widely used 'dig' tool for DNS queries. He has taught the senior operating systems class at USC, and has been a teaching assistant for various computer systems classes. He has served as a reviewer for National Science Foundation proposals, and for a number of professional conferences and publications including IEEE InfoCom, ACM SigComm, GlobeComm, Networld+Interop, Supercomputing, and IEEE Selected Areas in Communications.

- UltraDNS - Founding CTO（Oct 1999 – May 2001）
  - Chief technologist directly involved in founding the company; architected company product platform; worked with CEO and VP Marketing to shape initial product offering and business plan resulting in completion of an 8 million dollar series-A financing round.
  - Provided technology team oversight and management of system development and operational deployment of the company's first product: an outsourced Internet DNS service platform. Responsible for growing the initial engineering and operational team from three to eighteen employees; grew team to over forty employees as company scaled.
  - Played a significant role in representing the company externally; key contributor to company and product positioning collateral; lead analyst and press interviews, strategic partnership discussions and major customer engagements. Member of business development team that initiated major customer acquisitions including Microsoft Hotmail and Oracle.
  - Maintained ongoing responsibility for defining technical direction, development of intellectual assets, management of the Technical Advisory Board, interaction with external standards organizations, and evaluation of potential technology partnerships. Defined CTO Office mission, developed operating process for CTO activities, and hired team to analyze and develop strategic company initiatives.
- CenterGate Research Group LLC Chief Scientist and Technology Group Manager（May 1999 – Oct 1999）
  - Principal technologist and leader of Internet and systems infrastructure incubator; responsible for strategic direction, system design, technical oversight, and resource and project management.
  - Principal architect and project manager of UltraDNS software development and service deployment.
  - Co-designer and responsible for technical oversight of network performance monitoring project which eventually became Catbird Networks.
  - Technical lead and project manager for initial version of Whitehat Internet mail campaign system.
- Information Sciences Institute - Computer Scientist（Nov 1994 – May 1999）
  - Member of Xbone research group that developed an automated virtual network deployment system. Collaborated on initial project direction and architecture, responsible for initial resource management daemon, collaborated on initial application protocol definition, and represented Xbone at funding agency conferences and group meetings.
  - Member of Large Scale Active Middleware research group. Responsible for system to automatically configure set of interconnected proxy caches, and algorithms to route HTML requests among caches.
  - Member of Netstation research group that developed a system architecture in which the system bus is replaced by gigabit LAN technology. Designed and implemented high-performance TCP for Netstation display; designed and built display operating environment based on Texas Instrument's executive primitive library. Designed and prototyped Device Transport Protocol, a structured protocol designed to allow efficient implementation; achieved over 30,000 acknowledged pkts/sec.
  - Task leader of Mini-INDEX Project. Set direction and provided leadership for efforts to improve, and provide new, DNS tools and functionality. Recruited and managed graduate student assistants.
  - Technical lead for development of tools to assist automated administration of the .US Domain namespace; set project direction; recruited and managed graduate student assistants.
- Genuity Networks - Network Systems Consultant, Architect and Team Lead（Nov 1996 – Jun 1997）
  - Principal architect of first HopScotch system, Genuity's flagship web service product and one of the Internet's earliest CDN services.
  - Provided evaluations and recommendations about competing and complementary technologies. Architected product to achieve leveragable product differentiation.
  - Managed and mentored HopScotch software development team.
  - Assisted with acquisition of early adopter customers by explaining and positioning product solution.
  - Developed content and provided technical information to legal team for patent application.
- IBM - Research Intern, High Performance Networking Group（May 1992 – Nov 1992）in TJ Watson Research Center, NY
  - Designed configuration language for administrative policy for ISO inter-domain routing protocol (IDRP); specified language syntax and semantics, analyzed the interaction of policy semantics and the protocol's operational specification, and implemented the prototype version of policy language parser.
- University of Southern California - Research Assistant（Sep 1991 – May 1992）
  - Analyzed inter-domain routing systems; evaluated performance and scaling issues of algorithms and mechanisms for route computation in very large internetworks. Collaborated in the development of the Unified Routing Architecture with primary responsibility for route computation algorithms and information systems for the Source-Demand Routing Protocol.
  - Designed software simulation tool to generate very large internetwork models with configured topology and service characteristics; directed masters student's prototype implementation efforts.

1. Overview

Microprocessors are now often used in peripheral devices. Recent advances in multicomputer research have produced chip-sized gigabit network interfaces that operate across spans from a centimeter to 100s of meters [1][2]. Since a gigabit local-area network (LAN) has roughly the same channel capacity as a system bus, it is now reasonable to consider the substitution of a gigabit network in place of a system bus.

In conventional computer architectures the main processor communicates with its major peripheral devices via a system bus. In a netstation architecture the communication function of the system bus is replaced by a high-speed internetwork [3]. Peripheral devices communicate with the hosts that control them via the network. Netstation architecture blurs the physical boundary of a computer system. It also blurs the definition of what a host is or is not.

The advantages of utilizing a gigabit network rather than a bus are improved scaling and performance combined with vastly greater accessibility. Networks provide symmetric communication and support simultaneous transfers. Data can be exchanged between any two hosts directly. By relying upon Internet protocols, devices attached to the network are directly accessible to any other host on the internetwork.

To access and control devices across a network requires the development of commonly understood network protocols and interfaces. The client/server

model can be extended to apply here. The focus of netstation research is the design and implementation of efficient communication and control mechanisms between the device-client, that controls a device, and the device-server, that presents via the internet an interface to the physical device.

2. Problem Outline

The network interface in the past was not seen as a principal part of the system architecture. The network channel was treated as a slow-speed peripheral device. However, with the advent of gigabit networks, the network is no longer a slow-speed device and it operates at speeds that approximate mainsystem memory bandwidth. To achieve reasonable performance, a gigabit network interface must be tightly coupled to main-system memory.

In a netstation architecture the principal peripheral device is the network interface. The system bus is largely replaced as a key communications medium by the internetwork. To achieve this, peripheral devices such as disks, displays, keyboard with mouse, are made autonomous nodes on the internet. The operating system or application process that accesses and controls peripheral devices does so via messages that are sent across reliable transport protocol connections.

This architectural shift toward the network as the dominant peripheral communications medium requires both an adaptation of existing kernel device-control methods where practical and creation of new control methods that reflect the physical and administrative differences of a message-based distributed-system architecture. Questions of system configuration, naming, resource discovery and access control must be addressed.

Figure 1. Netstation Architecture

2

2.1 Unit of Transfer

The fundamental unit of data transfer across a bus is a word and the fundamental bus data-transfer operations are load and store. Transfer latency across a bus is a few nanoseconds and the transfer overhead a few tens of nanoseconds typically. The fundamental unit of data transfer across the internet is a packet. The packet is a grossly larger unit of communication than a word. Transfer latency across the internet varies from several microseconds to tens of milliseconds, and the typical transfer overhead at the source and destination is currently at least several microseconds.

It is possible to access and control devices that are non-resident with little or no change in devicecontrol software by using distributed memory. However, the performance obtained using distributed memory in an internet setting would be poor, since the vast majority of hosts provide little or no support for it. A message-passing model of distributed computation is better adapted to the internet operating environment.

Though message passing is better suited to the internet environment, differences in overhead and latency restrict the types of devices that are suitable for network distribution. Transfer latency across gigabit networks is limited by path length. Little can be done to significantly improve that. For some device types, that latency will limit the maximum practical separation between the client and device. Unlike transfer latency, reducing the per-packet overhead is not an intractable problem. In the context of high-speed networking it is being actively studied and remains a fruitful area of research.

2.2 Means of Transfer

In the context discussed here, we assume that data and commands that pass between a device and its controlling application occur via messages that are sent across the internet. The reliability and fidelity of the command transfer across the internet must closely approximate that obtained crossing a system bus. Commands sent to the device sub-system must exhibit execute once (and only once) semantics. A straightforward way to accomplish this is for the application to issue commands using remote procedure calls (RPCs) that are carried via a reliable transport-layer protocol.

The rate that commands can be issued is limited by that request/response time. Reducing the packetrelated overheads between the controlling application and the netstation node that it is using is particularly important. TCP is not well-adapted to the task of transferring RPCs to an application. It provides a byte-stream to the source and destination applications, rather than a sequence of objects framed by the source. The delay-bandwidth product across a high-speed LAN is also often less than even a small RPC packet. A specialized transport protocol that is designed to carry RPCs may reduce packet-related overhead by allowing RPCs to be individually framed.

The External Data Representation and Remote Procedure Call standards as documented by RFC1014 [4] and RFC1050 [5] are sufficient standards that allow creating the RPCs used to control devices. The RPC standard in RFC 1050 is not transport layer-specific. Implementations exist for more than one transport protocol.

Industry is moving towards device-command formats that are suitable to the networking domain. An example of this is the SCSI-3 standard for command of devices that is being developed by ANSI/ISO [6]. SCSI-3 defines the syntax framework of commands sent to target devices for execution, their semantics, certain aspects of error reporting and recovery, and the behavior of queueing at the target device for environments where multiple requests may be outstanding. Methods for access ordering are covered, but access control, ownership and authentication issues are not discussed.

The SCSI-3 committee has considered the transporting of commands over a variety of different media, including high-bandwidth point-to-point channels and networks. As a result, SCSI-3 commands adopt a

https://en.wikipedia.org/wiki/Humanized_mouse

A humanized mouse is a mouse carrying functioning human genes, cells, tissues, and/or organs. Humanized mice are commonly used as small animal models in biological and medical research for human therapeutics.

A humanized mouse or a humanized mouse model is one that has been xenotransplanted with human cells and/or engineered to express human gene products, so as to be utilized for gaining relevant insights in the in vivo context for understanding of human-specific physiology and pathologies.[1] A lot of our knowledge about several human biological processes has been obtained from studying animal models like [[rodent]s] and non-human primates. In particular, small animals such as mice are advantageous in such studies owing to their small size, brief reproductive cycle, easy handling and due to the genomic and physiological similarities with humans; moreover, these animals can also be genetically modified easily. Nevertheless, there are several incongruencies of these animal systems with those of the humans, especially with regard to the components of the immune system. To overcome these limitations and to realize the full potential of animal models to enable researchers to get a clear picture of the nature and pathogenesis of immune responses mounted against human-specific pathogens, humanized mouse models have been developed. Such mouse models have also become an integral aspect of preclinical biomedical research.[2]

History

The discovery of the athymic mouse, commonly known as the nude mouse, and that of the SCID mouse were major events that paved the way for humanized mice models. The first such mouse model was derived by backcrossingC57BL/Ka and BALB/c mice, featuring a loss of function mutation in the PRKDC gene. The PRKDC gene product is necessary for resolving breaks in DNA strands during the development of T cells and B cells. Dysfunctional PRKDCgene leads to impaired development of T and B lymphocytes which gives rise to severe combined immunodeficiency (SCID). In spite of the efforts in developing this mouse

model, poor engraftment of human hematopoietic stem cells (HSCs) was a major limitation that called for further advancement in the development humanized mouse models.[3] The next big step in the development of humanized mice models came with transfer of the scid mutation to a non-obese diabetic mouse. This resulted in the creation of the NOD-scid mice which lacked T cells, B cells, and NK cells. This mouse model permitted for a slightly higher level of human cell reconstitution. Nevertheless, a major breakthrough in this field came with the introduction of the mutant interleukin 2 receptor α (IL2rα) gene in the NOD-scid model. This accounted for the creation of the NOD-scid-γcnull mice (NSG or NOG) models which were portrayed to have defective interleukins IL-2, IL-4, IL-7, IL-9, and IL-15. Researchers evolved this NSG model by knocking out the RAG1 and RAG2 genes (recombination activation genes), resulting into the RAG^{null} version of the NSG model that was devoid of major cells of the immune system including the natural killer cells, B lymphocytes and T lymphocytes, macrophages and dendritic cells, causing the greatest immunodeficiency in mice models so far. The limitation with this model was that it lacked the human leukocyte antigen. In accordance to this limitation, the human T cells when engrafted in the mice, failed to recognize human antigen-presenting cells, which consequated in defective immunoglobulin class switching and improper organization of the secondary lymphoid tissue.[4]

To circumvent this limitation, the next development came with the introduction of transgenes encoding for HLA I and HLA II in the NSG RAG^{null} model that enabled buildout of human T-lymphocyte repertoires as well as the respective immune responses.[5]

Types

Engrafting an immunodeficient mouse with functional human cells can be achieved by intravenous injections of human cells and tissue into the mouse. This section highlights the various humanized mice models developed using the different methods.

Hu-PBL-scid model

This model is developed by intravenously injecting human PBMCs into immunodeficient mice. The peripheral blood mononuclear cells to be engrafted into the model are obtained from consented adult donors. The advantages associated with this method are that it is comparatively an easy technique, the model takes relatively less time to get established and that the model exhibits functional memory T cells.[6] It is particularly very effective for modelling graft vs. host disease.[5] The model lacks engraftment of B lymphocytes and myeloid cells. Other limitations with this model are that it is suitable for use only in short-term experiments (<3 months) and the possibility that the model itself might develop graft vs. host disease.[5]

Hu-SRC-scid model

Hu-SRC-scid mice are developed by engrafting CD34+ human hematopoietic stem cells into immunodeficient mice. The cells are obtained from human fetal liver, bone marrow or from blood derived from the umbilical cord,[7] and engrafted via intravenous injection. The advantages of this model are that it offers multilineage development of hematopoietic cells, generation of a naïve immune system, and if engraftment is carried out by intrahepatic injection of newborn mice within 72 hours of birth, it can lead to enhanced human cell reconstitution. Nevertheless, limitations associated with the model are that it takes a minimum of 10 weeks for cell differentiation to occur, it harbors low levels of human RBCs, polymorphonuclear leukocytes, and megakaryocytes.[5]

BLT (bone marrow/liver/thymus) model

The BLT model is constituted with human HSCs, bone marrow, liver, and thymus. The engraftment is carried out by implantation of liver and thymus under the kidney capsule and by transplantation of HSCs obtained from fetal liver. The BLT model has a complete and totally functional human immune system with HLA-restricted T lymphocytes. The model also comprises a mucosal system that is similar to that of humans. Moreover, among all models the BLT model has the highest level of human cell reconstitution.[8]

However, since it requires surgical implantation, this model is the most difficult and time-consuming to develop. Other drawbacks associated with the model are that it portrays weak immune responses to xenobiotics, sub-optimal class switching and may develop GvHD.[5]

Established models for human diseases

Several mechanisms underlying human maladies are not fully understood. Utilization of humanized mice models in this context allows researchers to determine and unravel important factors that bring about the development of several human diseases and disorders falling under the categories of infectious disease, cancer, autoimmunity, and GvHD.

Infectious diseases

Among the human-specific infectious pathogens studied on humanized mice models, the human immunodeficiency virus has been successfully studied.[5] Besides this, humanized models for studying Ebola virus,[9] Hepatitis B,[10]Hepatitis C,[11] Kaposi's sarcoma-associated herpesvirus,[12] Leishmania major,[13] malaria,[14] and tuberculosis [15] have been reported by various studies.

NOD/scid mice models for dengue virus [16] and varicella-zoster virus,[17] and a $Rag2^{null}\gamma c^{null}$ model for studying influenza virus [18] have also been developed.

Cancers

On the basis of the type of human cells/tissues that have been used for engraftment, humanized mouse models for cancer can be classified as patient-derived xenografts or cell line-derived xenografts.[19] PDX models are considered to retain the parental malignancy characteristics at a greater extent and hence these are regarded as the more powerful tool for evaluating the effect of anticancer drugs in pre-clinical studies.[19][20] Humanized mouse models for studying cancers of various organs have been designed. A mouse model for the study of breast cancer has been generated by the intrahepatic engraftment of SK-BR-3 cells in NSG mice.[21] Similarly, NSG mice intravenously engrafted with patient-derived AML cells,[22] and those engrafted (via subcutaneous, intravenous or intra-pancreatic injections) with patient-derived pancreatic cancer tumors[23] have also been developed for the study of leukemia and pancreatic cancer respectively. Several other humanized rodent models for the study of cancer and cancer immunotherapy have also been reported.[24]

Autoimmune diseases

Problems posed by the differences in the human and rodent immune systems have been overcome using a few strategies, so as to enable researchers to study autoimmune disorders using humanized models. NSG mice engrafted with PBMCs and administered with myelin antigens in Freund's adjuvant, and antigen-pulsed autologous dendritic cells have been used to study multiple sclerosis.[25] Similarly, NSG mice engrafted with hematopoietic stem cells and administered with pristane have been used for studying lupus erythematosus.[26] Furthermore, NOG mice engrafted with PBMCs has been used to study mechanisms of allografts rejection in vivo. Data Blames Viruses for Cancer Cells

Louisville, Ky.—(AP)—Top virus experts today presented new and surprising evidence that human cancers probably are caused by viruses.

They also reported that some viruses, contrary to current scientific opinion, can produce substances which destroy cancers.

If specific viruses can be pinpointed in human cancers, new methods might be developed to prevent or control the disease.

"Every man is a walking museum of many viruses," Dr. Jerome T. Syverton of the University of Minnesota told a seminar for science writers sponsored by the American Cancer Society.

Body's Full

Man harbors more than 150 viruses, mostly just recently detected, and "we are not sure what many of them do," he said. But "now we believe that some human cancers must be caused by viruses."

Dr. Sarah Stewart of the National Cancer Institute, Bethesda, Md., reported that extracts from two human cancers, and from the urine of three children with cancer have produced curious, cancer-like growth changes in healthy human cells grown in laboratory dishes.

There are grounds to suspect —but no proof yet — that the extracts could contain a virus.

She also has found that a virus causing leukemia in mice can induce cancers in other types of animals. Humans handling the cancerous mice have been found to have antibodies against the virus, indicating they had been infected with it but had resisted it.

"There are tantalizing leads" now to incriminate viruses in human cancers, said Dr. Wendell M. Stanley, Nobel Prize winner of the University of California.

Now there is evidence for a theory that some viruses may lie sleeping innocently in the body until triggered into cancerous growth by some insult or injury or even by age.

Dr. Bernard Briody of Seton Hall College, South Orange, N. J., said vaccination with viruses used against human smallpox had killed cancer cells and arrested mouse cancers so that vaccinated cancerous mice lived 65 per cent longer than non-vaccinated ones.

Foe Isolated

Similarly, Dr. Vincent Groupe of Rutgers University said he had extracted from animal cancers, caused by viruses, a substance which killed the cancer viruses.

Dr. Jorgen Fogh of the New York State Health Department, Albany, N. Y., reported observing normal human cells grown in laboratory flasks changing into cancerous cells when they were injected into rats or humans.

In one bit of many-faceted research at Minnesota, Dr. Syverton and associates find that almost any virus can infect numerous species of animals.

Technique Reveals Difference Between Human, Mouse Cells

By DELOS SMITH
UPI Science Editor

New York – (UPI) – In at least one circumstance it is very difficult to tell people from mice. That circumstance is when both man and mouse are down to their smallest working parts and those parts are living in dishes. This part is the cell. Human cells and mouse cells are cultivated in dishes of nutritional broth in the same laboratories around the world. Unhappily cell cultures get contaminated by cells from another dish which may be nearby or in another room.

Delos Smith

Contamination shouldn't happen but it does despite the most stringent precautions, and when it does the results of months of scientific experimentation with cultured cells become questionable.

That's why the science of cytology (which is the study of the cell,) is newly attuned to Dr. S. Fedoroff, cytologist of the University of Saskatchewan, Saskatoon, Canada. His better mouse-trap is an easy technique for telling the difference between man and mouse at the cellular level.

Tedious Work

Heretofore it took elaborate methods and tedious work. Now, by the Fedoroff technique, it can be done in a few minutes. It is based on the assumption that the serum of blood contains a chemical "system" which is poisonous to cells of any species other than the species from which the blood came.

This system, Fedoroff reasoned, is antibody, antibody's chemical adjuncts and antibody's positive electric charges. To test this idea, he put four different strains of mouse cells into the same culture with six strains of human cells.

When all one million of them were flouishing, indistinguishable human from the mouse, he added a little human blood serum. After only one hour of incubation all the cells of all the mouse strains were dead but the cells of all six human strains kept right on flourishing.

He experimented to find out what happened. He found what happened was that human serum containing the "cytotoxic system" adhered to mouse cells from where it did its poisonous work but could not stick to human cells.

Reason Unknown

He went on to discover that human serum was invariably poisonous to cells of a number of species other than mice. Confusingly, however, he found that human cells were not the only cells which were undisturbed by human serum. The reason why that is so he doesn't know yet.

But in tissue culture laboratories everywhere the cells under cultivation are almost all either human or mouse. This means the human cultures can be kept in an uncontaminated state by the routine addition of a little human serum now and then.

Federoff warned that freshly drawn human blood should be used because antibody's chemical adjuncts are quickly lost in storage. If one person's blood doesn't work, the cytologist should draw blood from another person. The blood of some people may be too low in cytotoxic antibody to be effective, he said.

Is Cancer A Virus?

Triggering Roles Of Some Chemicals And Radiation

If some virus, or more than one, causes cancer —

and many scientists think this will prove to be the case
— then we could move toward its conquest through vaccines.

Developments are boiling up so rapidly, they're hard to keep track of and that's the challenge taken on in this series by a top science writer. This is the third chapter summing up the evidence.

By JOHN TROAN, Scripps-Howard Science Writer

The ever-expanding virus zoo is populated by strange creatures that behave like beastly biological beatniks.

This microscopic menagerie includes:

—Latent, or sleeping viruses. They lie dormant until something comes along to rouse them into action.

—Passenger, or hitchhiking, viruses. They may be harmless fellow travelers accompanying wicked partners, or they might ride piggyback on other viruses to sneak in and do their own dirty work.

—Masked viruses. They invade a cell, then go undercover to carry on their miserable mischief in secrecy.

—Hit-and-run viruses. They do their damage and run away, much like the motorist who flees the scene of an accident.

All these breeds, and more, are under the scrutiny of scientists studying how viruses cause cancers in animals and whether viruses do the same in humans.

Animal studies have shown a cancer virus can be acquired early in life, sometimes before birth, yet remain latent for years before it springs into action to produce a tumor. In many cases, it may lie dormant forever. So no cancer develops.

Just 'Passengers'

Some viruses found in cancer tissues may have nothing to do with the tumor. They're just innocent "passengers." On the other hand, some which do cause animal cancers may hitchhike their way into the victim's body aboard fairly harmless viruses.

In some instances, a virus can produce an animal cancer and then drop out of sight.

At times, it really remains behind in a "masked" state and can be passed to another animal to produce another cancer. Which is the only way to prove it's still there, working as an undercover agent. In other cases, it disappears completely. Like a hit-and-run culprit.

To complicate research, cancer viruses also are mighty choosey. As a rule, each such virus picks only on one species of animal. So it may be impossible to reproduce the disease in another. In fact, one virus which causes only kidney cancer ordinarily attacks only leopard frogs that live only in New England!

Prize Exemption

Prize exception to this rule is the so-called polyoma virus. Dr. Ludwik Gross first chanced onto it at the Bronx (N. Y.) Veterans Hospital when it fouled up some of his mouse-leukemia experiments. Dr. Sarah E. Stewart and Dr. Bernice E. Eddy, at the National Institutes of Health, then isolated this virus and found ways to grow it in the laboratory. Polyoma virus can cause more than 20 kinds of cancer in mice, hamsters, guinea pigs, Mastomys (African rodents) and rats, plus non-cancerous tumors in rabbits.

One thing is clear. A virus which produces cancer in animals needs an accomplice to commit its crime.

The accomplice may be, unwittingly, the actual victim. Some animals, for instance, are born more susceptible than others to a cancer virus. Or their acquired resistance to such a virus is lower.

Thus some breeds of mice are pushovers for virus-caused leukemia while others rarely get it. Some chickens don't get blood cancer even if inoculated with as many as 145 billion particles of the virus that causes this disease, yet others develop it after receiving a mere 6000. (Even 6000 may seem a whopping figure but not when dealing with viruses, which are so tiny two million billion could fit into a pingpong ball.)

Basically, people are built the same. Some folks, for example, are forever bothered by colds (which are caused by viruses). Others never get one. Or take polio. Of every 1000 or so persons infected by polio virus, only one is crippled. Most of the rest, even if unvaccinated, stay well.

Other built-in factors play a role in cancer. One involves hormones. In humans, certain hormones can fire up certain cancers. In mice, the same thing happens. But only if the cancer-causing virus is present. A mouse free of the virus which produces breast cancer won't develop such a tumor even if its hormonal balance is upset.

It's like pulling the trigger of a gun. Whether it goes off depends on whether it's loaded. And even if it's loaded it won't go off unless it's triggered.

Does a similar phenomenon occur in humans? Do people carry viruses which won't bother them unless triggered into action?

At least one human virus, more a nuisance than a threat, works like this. It causes cold sores, or fever blisters. A latent virus acquired early in life, it lies still until triggered by something—the sun, the wind, a fever, an emotional upset. Or a shift in the body's hormone production.

Other Cancer Triggers

There are cancer triggers other than hormones. Excess radiation can lead to cancer both in humans and in animals. So can certain chemicals (including, many researchers contend, some chemicals found in cigaret smoke and auto fumes.)

But are these rays and these chemicals the roots of such evil? Or do they just unleash hidden cancer viruses which would remain harmless if undisturbed?

According to the National Cancer Institute, animal experiments have established that "radiation, hormones and chemical agents may act through viruses" to bring on cancer.

From the animal studies, it's also clear many more factors are mixed up in the cancer jigsaw. Among them: age, sex, nutrition, injury, chronic irritation, bone marrow (where red blood cells are made), the spleen (a warehouse for blood), the thymus gland (a mysterious organ behind the breastbone).

The virulence of the cancer viruses themselves is involved. In animals, such viruses seem naturally weak. Basically, this is a blessing. But to researchers it's a curse. To facilitate testing, the viruses must be souped up.

Dramatic Change

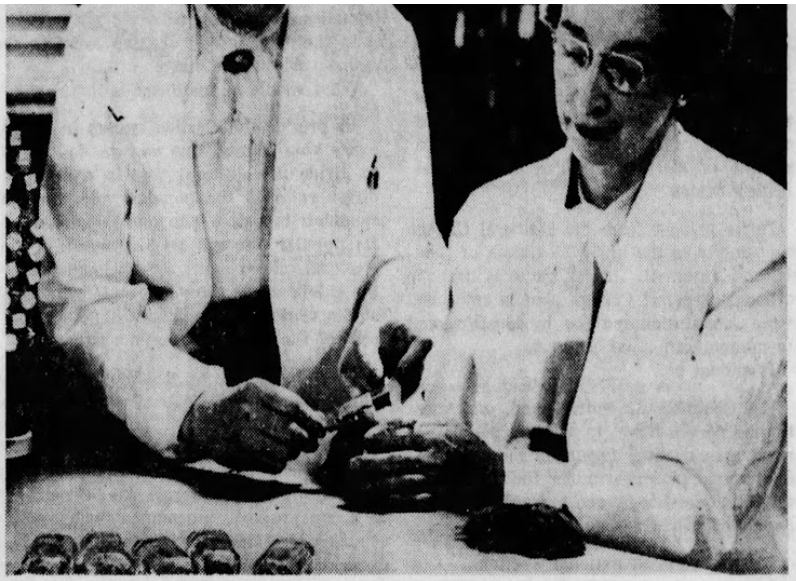
In the course of such studies, Dr. W. Ray Bryan at the National Cancer Institute discovered that the stronger the virus, the earlier the cancer crops up and the more vicious it is. Some animal viruses now can be so juiced up they produce cancer 100 per cent of the time.

"In no area of modern cancer investigation," says the Institute, "has there been a more dramatic change than in virus research.

"During the past decade scientific opinion has completely reversed itself, turning from the belief that viruses do not cause human cancer to the conviction that may be the direct cause or triggering agent for most, if not all, cancers.

"It appears almost certain that virus-caused cancer is a phenomenon that occurs in man as well as in animals and plants. Yet not one human cancer-causing virus has as yet been identified."

NEXT — The search for human-cancer viruses.



WOMEN RESEARCHERS at the National Institute of Health—Dr. Bernice E. Eddy (left) and Dr. Sarah E. Stewart—isolated the most versatile cancer virus yet found. It produces more than 20 kinds of cancer in five species of animals.

Molecules Yield Some Secrets

Scientists Say They're Near Knowledge Of Genetic Material's Structure, 'Life'

By JOHN A. OSMUNDSEN

© 1964 New York Times News Service

NEW YORK—Tremendous strides have been made in the last few years toward understanding the behavior of the molecules that bear the hereditary instructions for determining the form and function of all living things.

Scientists say, in fact, that they now are very near to a thorough knowledge of the structure of the genetic material, the mechanism by which it reproduces itself during cell division, how the hereditary messages are encoded in the structure of the genetic material and how those messages are translated into the chemical events within each cell.

Progress along those lines has been swift, largely because scientists have had almost perfect model systems to work with: Viruses, bacteria and other single-celled creatures. Those organisms are ideal because they multiply very rapidly, possess inheritable characteristics that are easily recognizable and they undergo changes (mutations) and exchanges (recombinations) by means that are analogous to mating in higher organisms.

Efforts to run higher cells through their reproductive paces and to record the details of their hereditary processes largely have failed for two main reasons.

First, it is difficult to grow stable lines of mammalian cells in test tubes and to have them retain their special properties, such as the synthesis of hormones, pigments and enzymes.

Second, mammalian cells do not normally "mate" or otherwise exchange hereditary parts, a prerequisite for the proper genetic study of an organism.

The possibility that both of those obstacles are about to be overcome was raised last weekend at a symposium on cell replication at the New York University School of Medicine.

Dr. Harry Eagle, of the Department of Cell Biology at Albert Einstein College of Medicine, reported that he has grown cultures of stable lines of human cells from a wide variety of tissues.

In a second report, Dr. Boris Ephrussi, professor of biology at Western Reserve University, said hybridization has been found to occur experimentally between mammalian cells in tissue culture. Hybrid cells were produced from "matings" of different cells from about 10 permanent cell lines, he said. Cells taken from inbred stocks of mice have been cultured together two types at a time, and have produced in each case a third kind of cell that was a combination of the two "mating" types of cells, the professor explained.

The hybrid cells are distinguished by their chromosomes, or heredity determining structures, Dr. Ephrussi said. But identifying hybrids by looking at their chromosomes is a tedious process and does not permit the sort of studies that could be carried out if there were some "automatic" way of selecting them while they still were alive in tissue culture.

A way to do this was found recently by Dr. John Littlefield, of Massachusetts General Hospital. He found two lines of mouse cells, each of which was identifiable by its inability to digest a particular substance.

The yield of hybrids was very low, but Dr. Ephrussi, working with those same lines of cells, has worked out ways of producing mammalian hybrid cells in large enough numbers to allow the study of how their special cell functions are controlled.

The studies of single cells, however, still are far from revealing how "governments" of cells — such as all the cells in a liver or a spleen — work in the whole organism.

Human Organism Joins With Mouse, Hen

Unrelated Cells Fused Into Unit

[The Sunday Times, copyright]

LONDON — Two Oxford scientists have produced the strangest hybrid forms of life ever seen in the laboratory—or out of it.

They have fused into single units, cells of species as different as humans, rats, mice, rabbits and chickens.

In many cases the hybrids lived for more than two weeks, and there are signs that they may actually reproduce.

In the latest issue of the scientific journal Nature, Professor Henry Harris and Dr. J. F. Watkins, of the Sir William Dunn School of Pathology, Oxford, report their first results, which involved fusing human and mouse cancer cells.

"We have now done the same thing with many other types of cell," Professor Harris said. "The most remarkable combination is hen and man because the hen, of course, is not even a mammal."

It has been known for some time that some viruses make cells of the same species fuse together. Now Professor Harris and Dr. Watkins have applied the same technique to cells of widely different species.

It seemed so improbable that it would work that nobody had ever tried it before. "I didn't think it was impossible or I would not have made the attempt," said Harris. "But I was very surprised when it worked."

Even closely - related animals like rats and mice cannot interbreed. In fact the inability to interbreed with other species is the main criterion of a biological species, so hybrid cells such as human-hen, rat-rabbit and rabbit-man produced by a kind of artificial sexuality are of extraordinary biological interest.

In most cases when two or more cells fuse, their nuclei (which contain the hereditary material of the chromosomes) remain separate. However, in some cases the nuclei fuse too, and there is evidence that these hybrids may be able to reproduce. "I'm only guessing, but I think, it's likely that we shall get reproduction," said Harris.

RESEARCH OPENS

Hybrid cells open up a number of important lines of research. One, in which the Oxford scientists are particularly interested, is that they are a new way of studying the interactions between the nucleus and the rest of the cell.

This is connected with how the genetic instructions in the chromosomes are put into effect. Another is the reproduction of the hybrids.

If they reproduce will they do so as hybrids or will they split up again into their original types of cell?

NEW LIGHT

A third possibility is that hybrid cells could throw new light on the question of immunity and how the body deals with foreign material.

If, say, a chicken or a mouse cell is introduced into the human body it is quickly destroyed by antibodies, but, at Oxford, cells involved in antibody production have already been fused with cells of other species.

Vanderbilt Dies

LOS ANGELES (AP)—Gloria M. Vanderbilt, 60, the mother of heiress Gloria Vanderbilt, died of cancer Saturday at Cedars of Lebanon Hospital. The widow of Reginald C. Vanderbilt, following his death she and other members of her family were involved in a custody battle over her daughter Gloria. The daughter's aunt, Mrs. Harry Payne Vanderbilt Whitney, was given custody. While married to conductor Leopold Stokowski, the daughter discontinued her mother's $21,000 annual allowance in 1946.

Experiments Spark Fresh Optimism

Hunt For Cancer Cure 'Frustrating'

The scientific assault on cancer has been long, intense and frustrating. A final breakthrough is not yet in sight. But several new research reports, taking a similar tack, are stirring lively interest. This is the second of two articles on the latest developments and their implications.

NEW YORK (AP)—The effort to enlist the body's own defences against an invading disease is perhaps the most active front today in the battle against cancer. A scattering of research reports has focussed fresh interest on this approach.

One expert calls it "the most promising area of cancer research today." Another, looking at recent experiments, finds there's "a ray of light in a dark room."

If there is some hope that researchers may be working on some promising leads, it must be set against the background of a thousand disappointments of the past.

In the last months there have been some interesting variations on the idea that in the immune processes of living creatures there is a way to defeat cancer, just as viruses and bacteria are defeated.

SOME DISAGREEMENT

There are a number of current reports—but researchers disagree on their ultimate value:

In Detroit, researchers claim to have created an experimental method linking human tumor cells to rabbit protein to prod a cancer patient's body into fighting his own cancer. But they say their work is strictly preliminary and needs more laboratory confirmation and refinement.

In Buffalo, N.Y., researchers have exchanged small transplants of tumor between cancer patients in hopes that each would develop usable defences against the tumor of the other. However, they have maintained silence on the final outcome of the experiment.

One patient, Harry T. Griffith of Philadelphia, involved in an experimental transplant died Monday. A spokesman in Buffalo said the transplant was of little or no value in Mr. Griffith's case.

His partner in the experiment, Robert F. Allen of Tucson, Ariz., and two other men who took part in a similar experiment were reported to be progressing, but the hospital said it would be some time before their condition would be evaluated.

HAVE USE DRABBITS

In Los Angeles some researchers have produced rabbits they believe to be tolerant of all human tissue—and have talked about using the rabbits to manufacture anti - cancer serum for human patients. But other scientists have questions to ask about the method.

Although these reports have ridden the crest of the recent news, there have been countless small advances in well-manned laboratories that have gradually accumulated the evidence that supports much of the hope.

All these lines of research converge on the same mechanism that helps you eventually recover from a cold, or permits vaccination against a virus, or prevents a patient from borrowing a bidney from other humans when his own goes bad.

Indeed, this area of cancer research is closely tied to the barrier that prevents individuals from exchanging organs in transplant operations. The body is able to recognize the strangeness of something introduced into it and to mobilize defences against the intruder—except for, perhaps, the cancer cell.

HARD TO PROVE

It has not been shown, in the eyes of most researchers, that the human tumor cells harbor foreign characteristics that will enable the body to recognize them as enemies. Most believe the tumor cell is strange—but proving it is another matter.

The cancer cell is a normal cell running wild. Perhaps it is enough like a normal cell that it doesn't awaken the body's defence mechanisms.

Or perhaps some cancer cells have a way of subduing the body's defence mechanisms. Often a cancer patient dies of pneumonia or other infection—his body's resistance so lowered that he can't fight back.

Still, there are a few cases where cancers in humans suddenly and mysteriously shrink and disappear.

And there are cases, when the main or primary tumor is removed by surgery or destroyed by radiation, in which seed cancers spread from the main tumor unaccountably.

Or there are situations where seed cancers suddenly appear at other places in the body, long after the primary tumor has been removed. That, in itself, might suggest that the body's defence mechanism held the seed cancers in check for some time.

HAS PLAYED SOME ROLE

In all these cases, researchers believe, the body's immune mechanism has played a role, recognizing and fighting the cancer as an intruder.

Using immunity against disease is hardly new. By the time most Canadian and United States children are 5, they have been immunized against smallpox, polio and diptheria.

The procedures are many. The human may be given a live, but weakened, polio virus. He responds by producing antibodies — disease - fighting agents—against the virus. Even when he encounters more virulent polio viruses, the antibodies are effective against it. Sometimes, instead of live viruses, killed viruses or live but related viruses can be used to produce immunity.

The body has a spectrum of disease-fighting agents. Antibodies flow freely in the blood stream, produced by certain cells. Then there are apparently other disease-fighters directly associated with cells. Lymphocytes—a type of white blood cell—carry disease-fighting equipment. The body even has some specialized cells that actually devour some foreign matter that invades.

ARE PROTEIN MATTER

Antibodies themselves are specially designed bits of protein which can fit onto foreign protein, neutralizing it.

Foreign material that stimulates antibody production is called an antigen.

In the case of viruses, for instance, the body's immune mechanism recognizes "virus particle by antigens in its protective protein coat—and forms antibodies to lock the virus in its coat and prevent it from infecting a cell.

Research has shown that viruses that cause cancer in animals produce certain characteristics on the animal tumor cell membrane that the body can recognize as antigens.

But the proof is difficult, and recent attempts to show the same holds true for human tumors are being anxiously followed.

A NEW TACT

The proof that antibodies can be stimulated by cancer cells is fairly new. In 1953, researchers found they could make a mouse immune to a chemically-induced tumor by first transplanting a tumor from a related mouse, then surgically removing it. The mouse exposed to the tumor transplant for a period was then resistant to further attempts to transplant that same kind of tumor.

Other researchers have learned to play tricks with antigens in animals—and stimulate antibodies against cancer.

For instance, one virus was known to cause leukemia in the newborn of a certain inbred family of white mice. A few months after inoculation the baby white mice developed leukemia. Adult white mice of the same family could then be given the leukemia by injecting them with leukemic cells from the new-born mice.

The same virus could be used to produce leukemia in a different mouse family—a black mouse. But when leukemic cells from the black mice were injected into adult white mice, the white mice rejected them because their immunity systems recognized the black mouse leukemic cells as foreign, coming from mice that were genetically different.

PRODUCED NOTHING

Weeks later, the researchers took the same white mice that had rejected the black mice leukemia cells and injected them with leukemia cells from white mice. Normally, these leukemia cells would have produced leukemia in the white mice—but they didn't.

Receiving the genetically different leukemia cells had stimulated the white mice to produce defences against such cells and those defences were effective against leukemic cells from their own family.

These experiments suggested that tumors might be dealt with by immunological techniques. But the question persists:

Can you demonstrate that human tumors also are identified by the body as foreign intruders? Do they also possess antigens that would stimulate the body to produce antibodies against cancer?

Is there something in common between various kinds of tumors that would awaken the body's defences? Or is each tumor different?

The search for the answers is under way.

SCIENCE AND MAN

Dr. Joshua Lederberg

Artificial evolution

SOMATIC hybridization of tissue cells has been the subject of previous comment in this column.

We turn now to some recent findings having great interest in theoretical biology.

They represent the work of several laboratories, notably that of Professors Henry Harris, of Oxford; Boris Ephrussi, of Paris, and Hilary Koprowski, of the Wistar Institute, Philadelphia, and have been reported in the Proceedings of the Royal Society of London and of the National Academy of Sciences here.

A better demonstration of the evolutionary continuum cannot be imagined than that cells of fish, birds, mice and men can be mixed in any combination and the chromosomes of each species will continue to function in the hybrid cells.

The fundamental cellular processes of DNA-replication, its transcription into RNA and the coding by RNA of essential proteins are therefore compatible among these species — in fact, must be very nearly identical.

This is not to say that a normal developmental process leading to a whole organism could be expected from such combinations.

Even within a species, this is too easily upset by minor quantitative changes in chromosome number.

We can, however, begin to think of experiments in artificial evolution on the grandest scale, at least on a cellular level.

It will be surprising if we fail to find cell hybrids between species as useful in medicine as animal and, especially, plant hybrids have been in agriculture.

Some of the most interesting experiments are preliminary but cogent attacks on problems of tissue differentiation, cancer and virus biology.

Cells of different tissue types can be fused, allowing rigorous questions to be asked concerning the mechanism whereby some cells behave as muscle, others as nerve and so on.

The most favorable experimental material has quantitatively measurable products specific to the tissue.

For example, melanoma is a tumor characterised by the formation of dense pigment, a property maintained in tissue cultures from single cells. Hamster melanoma cells were hybridised with various cell lines of the mouse.

The mouse hamster combination is a favorable one since the chromosomes of the parent species are very different in size and shape and each can be recognised in the hybrid.

The hybrid cells all failed to make pigment. This illustrates an active suppression of this biochemical capability of the hamster chromosomes. It corroborates an important theoretical principle of embryology and opens the way to further critical experiments on the mechanism of suppression — in particular, to explore the analogy with genetic repressors studied in microbes.

Similar results have been obtained with another highly differentiated tumor, the teratoma. This remarkable cell line has many of the potentialities for tissue organisation possessed by the primitive embryo.

It differs from the embryo mainly by its chaotic disorganisation and its unlimited growth. Hybrids of teratoma cells with other kinds of cells are still tumorous but have suppressed many of their tissue potentialities.

On the other hand, other qualities of tumor cells, and especially their quality as tumors, are often retained in cell hybrids. This shows that the cancerogenic quality itself is a positive attribute of the cell, not, as some have thought, merely the loss of certain restraining genes.

Some specific cell substances are also retained in amounts proportional to the proportion of corresponding chromosomes when hybrid cells are formed. These functions are therefore controlled from within the chromosome, not by some diffuse suppressor in the cytoplasm.

Since cell fusion can also occur within the intact animal, the possibility is raised that tumor spread and some more mysterious changes in tumors might result from it. The fact that certain viruses and chemicals can promote cell fusion also opens new routes for subtle effects of these agents in provoking tumors and other diseases.

science today

When viruses cause cancer

THERE is growing evidence that when a living cell from the body of an animal is infected by a virus in such a way as to be transformed into a cancer cell, the genetic material of the virus, consisting of DNA, is incorporated into the chromosomes of the infected cell.

An ingenious experiment, which supports this suggestion but does not amount to conclusive proof, has been reported by three scientists.

They are Dr M. C. Weiss, of the Carnegie Institute, Washington, B. Ephrussi, of the Centre for Molecular Genetics near Paris, and L. J. Scaletta, of the Western Reserve University, Cleveland.

When human cells in tissue culture are transformed by a virus known as SV40, the genetic material of the virus induces the cells to produce a characteristic protein which behaves as an antigen.

Because cells transformed by the virus keep on producing antigen for several generations, it follows that the genetic material of the virus must somehow be maintained in the transgeneration to the next as the cells divide.

The two obvious possibilities are that DNA from the virus is integrated into the chromosomes of the transformed cell and that the DNA resides and replicates itself in the cytoplasm of the cell independently.

Dr Weiss and her colleagues have hit on a clever way of distinguishing between these alternatives. When human cells grown in test tubes are fused with cells from mice, both of which separately can support the growth of SV40 virus, the resulting hybrid cells normally lose the human chromosomes they are endowed with in about 100 generations, or a period of about several months.

The separate chromosomes from mice and human beings can be distinguished in the hybrid cells by their size and shape.

Dr Weiss and her colleagues have fused a mouse cell and a transformed human cell to see whether the resulting hybrid cells lose the ability to make antigen when they lose mammalian chromosomes in the usual way.

With luck, this experiment could show whether the loss of a particular human chromosome from the hybrid cell is followed by the loss of the power to make antigen, which would imply that the chromosome concerned is the one that carries the genetic material from the virus.

The result of the experiment, as it has been carried out, is that the loss of antigen occurs at the same time as the loss of human chromosomes from the hybrid cells.

This finding is compatible with the idea that genes from the virus are indeed integrated into the human chromosomes, but it has one puzzling feature. It seems that hybrid cells keep on making antigen until nearly all the human chromosomes are lost.

The question, therefore, is whether several copies of the genetic material from the virus are incorporated into several different human chromosomes, or whether the chromosomes that carry the extra genetic material tend to be the last.

Further experiments will be necessary to distinguish between these possibilities.

Science And Man

Man and Mouse Merger

By Joshua Lederberg

SOMATIC cell genetics is rapidly becoming established as a new and powerful experimental tool for attacking important problems in cell biology. The key to its widespread adoption was the discovery that animal tissue cells could be made to fuse, in laboratory cultures, by exposing them to certain viruses.

Joshua Lederberg

Professor Henry Harris of the school of pathology at Oxford University, carried this observation one step further by showing that the virus could be made noninfective with ultraviolet light and still enable cells to fuse. This avoided the complication of carrying the virus along in further manipulations of fused cells.

Professor Harris's announcement, about three years ago, that cells of different animal species — man and mouse, for example — could be fused, attracted considerable attention. Since then, these observations have been confirmed and extended as the basis for some important analyses for which no other method was available.

The fused somatic cell lines start out with a complement of 86 chromosomes (46 from human, 40 from mouse). But as they are cultivated, the cells tend to lose chromosomes, usually leaving the mouse set intact and keeping from none to ten or so human chromosomes. Although the reasons for this irregular dropping out are not understood, the event can be used to help analyze exactly what role is played by the human compared to the mouse chromosomes in these hybrid cells.

★ ★ ★

IT HAS been known for some time, for example, that tissue cells, exposed to SV-40 virus often became transformed into a cancer-like form while at the same time the virus disappeared somewhere in the cell. The genetic material of the virus still manifests itself in these cells in various ways, such as production of a substance at the cell surface, the T-antigen, which can be recognized with the help of specific anti-sera. The T-antigen may also be quite significant for the cancer-like behavior of the cells.

A group of biologists (Mary C. Weiss, Boris Ephrussi and L. J. Scaletta) reported in the Proceedings of the National Academy of Sciences on their studies of human-mouse cell hybrids in which the human cell input had been exposed to SV-40 virus. They report that the hybrid cell lines occasionally lose the T-antigen, but only when they have also lost all of the human chromosomes originally present. This result implies that the SV-40 virus genes had become attached to the chromosomes, probably many times over.

The result is in agreement with the report in another issue of the same Proceedings, from a group led by R. Dulbecco of the Salk Institute in San Diego, that SV-40 transformed cells have from 20 to 50 copies of the SV-40 DNA, and that this DNA is physicaliy associated with the chromosomes of the cell insofar as these can be purified by physical methods.

Happily the anaconda is not

★ ★ ★

ANOTHER exciting application was reported by Dr. Howard Green's group at New York University Medical School in the December 21 issue of Nature magazine. The mouse cells used for making the hybrids were obtained from a mutant line carrying a genetic defect in the enzyme thymidine kinase. The hybrids regained the genetic information for this enzyme from the added human chromosomes. The subsequent loss of the enzyme could be correlated specifically with the loss of one of the so-called E-group (human chromosomes 21 and 22). That is, the normal gene for thymidine kinase in man is located on one of these chromosomes, which are also involved in Down's syndrome.

Thus, not only could a gene now be located on a specific chromosome, but for the first time this could be done even without the use of a known mutation in man affecting that enzyme. Instead, the experiment contrasts specific gene functions in human cells with those of the mouse, about which we have a wider range of experimental information.

★ ★ ★

SOMATIC cell genetics, in principle, ought to be even more important in studies on plants, where it would speed the development of entirely new kinds of crops. The already known ability of single plant cells to grow out into intact plants would make these procedures even more valuable. Perhaps because the issue was so clouded by fantastic and unbelievable claims forwarded by Lysenko during the period of government control of biology in the Soviet Union, however, tentative leads suggesting fusion of plant cells dating back more than 30 years have been virtually ignored.

Chromosomesmanship May Map Way to Understanding Cancer

BY IRVING S. BENGELSDORF, Ph.D.
Times Science Writer

Animals are made up of microscopically tiny units called cells. Each cell contains a centrally located nucleus inside of which are slender threads called chromosomes. Chromosomes consist of both proteins and deoxyribonucleic acid (DNA). Just as a strand of pearls is made up of individual pearls, one following another, the DNA of chromosomes are strands of individual genes—the units of heredity received from the previous generation.

So, the genes that determine whether a particular cell is that of a mouse, rat or human are strung together to form the DNA of that cell's chromosomes. The normal number of chromosomes within a cell depends upon the species of life—mouse cells have 40 chromosomes, rat cells have 42 chromosomes, human cells possess 46 chromosomes, etc.—with each chromosome being a string of several thousand individual genes.

Take some mouse cells and place them into a glass dish that contains food for them to grow and divide. Now take some rat cells and add them to the same dish. Every once in a while, a mouse cell and rat cell will combine or fuse together to form a new cell that has a single nucleus that contains both mouse and rat chromosomes. Such hybrid cells, with mouse-rat chromosomes in the nuclei, can grow and divide for many generations.

★

DNA-genes carry information that provide instructions to cells how to produce a large variety of materials called enzymes. An example of an enzyme is a substance known as lactose dehydrogenase. (L D H). Thus, there are genes in mouse chromosomes that carry information how to produce mouse-LDH. And there are genes in rat chromosomes that bear information how to produce rat-LDH.

Although mouse-LDH and rat-LDH perform the same functions in mouse and rat cells, respectively, the two differ enough from each other so that modern analytical techniques can detect one in the presence of the other. Since hybrid mouse-rat cells contain both mouse and rat chromosomes, one should detect both mouse-LDH and rat-LDH in such hybrid cells. Indeed, this is observed.

But this is not all. LDH, itself, is made up of four sub-units. And in hybrid mouse-rat cells one not only finds both pure mouse-LDH made up of four mouse LDH-subunits and pure rat-LDH made up of four rat LDH-subunits, but also "hybrid-LDH" made up of both mouse LDH-subunits and rat LDH-subunits! Not only is the cell a hybrid, but so can be its enzymes.

About a year ago, scientists at New York University reported that by growing mouse cells (40 chromosomes) and human cells (46 chromosomes) in the same dish they could isolate hybrid cells with mouse-human chromosomes in the nucleus.

As these mouse-human hybrid cells divide, they "spit out" human chromosomes. Thus, in cells 20 generations after the mouse and human cells originally had fused together, almost all the mouse chromosomes are present, but only 2 to 12 human chromosomes, of the original 46, remain. Eventually, all human chromosomes are ejected, from mouse-human hybrid cells as they continue to divide.

But, this human chromosome-ejecting behavior can be useful in pinpointing the location of specific human genes on specific human chromosomes. Thus, mouse-human hybrid cells can be prepared from normal human cells and from abnormal mouse cells that cannot produce an enzyme called thymidine kinase (TK). So, the only supply of TK in such hybrid cells would have to come from the TK-genes carried by human chromosomes.

One waits until all but one of the human chromosomes have been ejected from a mouse-human hybrid cell and then places this cell into a dish that contains a specific chemical that will not permit cells to grow unless TK is present. So, if the hybrid cell dies, then the single remaining human chromosome does not carry the TK-gene. But, if the hybrid cell survives, then TK must be present, derived from the TK-gene carried by the lone human chromosome.

In all cases where the hybrid cell survives, the human chromosome present is the same. So, we now know which human chromosome bears the specific information to produce TK-enzyme.

In the April issue of Scientific American, Drs. B. Ephrussi and M. C. Weiss of the National Center for Scientific Research in France, both pioneers in the study of hybrid cells, write, "It appears likely that within a few years, a number of human genes will have been assigned to specific chromosomes."

Knowledge of what a specific gene does, and on which chromosome it is located, can provide new insight into the study of inherited diseases, cancer, growth, etc. Like explorers of old, scientists now are making maps of previously unknown territory.

Combination cells provide maps of unmappable genes

By BARBARA J. CULLITON
Science Service Writer

SAN FRANCISCO — You can't cross a man and a mouse, can you?

Well, in a sense, yes, you can.

And when you've done it, you are on the way to solving such problems as whether a given couple will produce babies with inherited defects and, perhaps, how to reduce the size of cancerous tumors.

Further, you can begin to map the exact position of the heredity-carrying genes on their chromosomes. The work, just begun, should, in the next five years, provide an atlas of human genes, showing at least approximately where each one sits on the chromosome that carries it. Knowing the location is a necessary first step to dealing with them, and the genetic traits they control.

No one yet knows what other problems such an atlas would help solve, but, as with any new technique in science, it seems inevitable that such a tool can be applied to the solution of questions as yet unasked.

Dr. Frank H. Ruddle of Yale University, who predicts the assembling of the gene atlas by 1974, reports the finding of the location of one particular gene—the one that makes the body produce an enzyme called LDH. This substance helps in the digestion of milk. Enzymes are the catalysts that break down and make useful virtually all the chemicals the body needs to function. They are a key to most physiological operations.

To assign a gene a place in its micro-world, Dr. Ruddle and his colleagues had to go a long way around.

First, they crossed human cells with mouse cells, following a technique devised by Dr. Howard Green of New York University.

Both kinds of cells are brought together in a nutritious jelly, where they live about four days.

No one knows exactly how, but in the jelly, some of the mouse cells fuse with some of the human cells, becoming hybrid mouse-human cells.

The scientists can then kill off the parent cells, leaving only the combination cells.

These cells have all the mouse chromosomes, and only a portion of human ones — usually less than 12. But different cells may carry dfferent combinations of human genes.

Allowing these cells to reproduce themselves gives colonies of virtually identical man-mouse cells, with each colony slightly different in terms of the human genes involved.

Such cells should be able to produce any enzyme a mouse can, but only a few that appear in humans.

And, since the LDH in mice can be distinguished from human LDH, a researcher can find whether a given cell has the human gene that causes the enzyme to be made.

Further, since mouse and human chromosomes can be readily identified, a series of tests with different groupings of the human genes can, by a long and arduous process of elimination, pinpoint the one that is making the LHD — or, eventually, any other enzyme.

While chromosome mapping is the immediate aim of this type of research, Dr. James H. Conover of the Mount Sinai School of Medicine in New York suggests it may eventually be important in genetic counseling.

If scientists know which genes code for specific enzymes and where they are located, they could test for their presence or absence in the cells of would be parents and be able to tell them whether they are likely to bear a child with a genetic defect.

Work Begun on Atlas of Human Genes; Mapping of Their Position Is Forecast

By BARBARA J. CULLITON
Science Service Writer

SAN FRANCISCO — You can't cross a man and a mouse, can you?

Well, in a sense, yes, you can.

And when you've done it, you are on the way to solving such problems as whether a given couple will produce babies with inherited defects and perhaps how to reduce the size of cancerous tumors.

Further, you can begin to map the exact position of the heredity-carrying genes on their chromosomes. This work, just begun, should, in the next five years, provide an atlas of human genes, showing at least approximately where each one sits on the chromosome that carries it. Knowing the location is a necessary first step to dealing with them, and the genetic traits they control.

No one yet knows what other problems such an atlas would help solve, but, as with any new technique in science, it seems inevitable that such a tool can be applied to the solution of questions as yet unasked.

Dr. Frank H. Ruddle of Yale University, who predicts the assembling of the gene atlas by 1974, reports the finding of the location of one particular gene — the one that make the body produce an enzyme called LDH. This substance helps in the digestion of milk. Enzymes are the catalysts that break down and make useful virtually all the chemicals the body needs to function. They are a key to most physiological operations.

To assign a gene a place in its micro-world, Dr. Ruddle and his colleagues had to go a long way around.

First, they crossed human cells with mouse cells, following a technique devised by Dr. Howard Green of New York University. Both kinds of cells are brought together in a nutritious jelly, where they live about four days.

No one knows exactly how, but in the jelly, some of the mouse cells fuse with some of the human cells, becoming hybrid mouse-human cells.

The scientists can then kill off the parent cells, leaving only the combination cells.

These cells have all the mouse chromosomes, and only a portion of human ones — usually less than 12. But different cells may carry different combinations of human genes.

Allowing these cells to reproduce themselves gives colonies of virtually identical man-mouse cells, with each colony slightly different in terms of the human genes involved.

Such cells should be able to produce any enzyme a mouse can, but only a few that appear in humans.

And, since the LDH in mice can be distinguished from human LDH, a researcher can find whether a given cell has the human gene that causes that enzyme to be made.

Further, since mouse and human chromosomes can be readily identified, a series of tests with different groupings of the human genes can, by a long and arduous process of elimination, pinpoint the one that is making the LHD — or, eventually, any other enzyme.

While chromosome mapping is the immediate aim of this type of research, Dr. James H. Conover of the Mount Sinai School of Medicine in New York suggests it may eventually be important in genetic counseling.

If scientists know which genes code for specific enzymes and where they are located, they could test for their presence or absence in the cells of would-be parents and be able to tell them whether they are likely to bear a child with a genetic defect.

In another vein, two British researchers recently proposed that hybrid cells might be of use in fighting cancer. Drs. John Watkins and Louise Chen of Oxford University reported that when they hybridized mouse tumor cells with hamster cells and injected the hybrids back into the cancer-stricken mouse, its tumor regressed. Presumably, the hamster cells stimulated an attack by the mouse's natural defenses against foreign tissue that was strong enough to wipe out both the mouse tumor and the hamster cells. Participants at the San Francisco meeting of the American Society of Human Genetics termed this approach "fascinating," but cautioned that a large number of experiments will have to be completed before it is possible to judge whether it is really practical.

Dr. Conover is also working on mosquito-human hybrid cells which, he suggests, should induce an even stronger response because the species difference is so great.

$97,841 Grant for Research on Cancer at M.U.

Dr. Richard J. Wang, a University of Missouri biological science researcher, has been awarded $97,841 from the American Cancer Society for support of a program entitled "Genetics of Normal, Malignant and Hybrid Cells in Culture."

The overall objective of the proposed research is a more complete understanding of the genetics and biochemistry of normal and malignant human cells. Human, mouse and human-mouse hybrid cells will be used as the main source of experimental material.

Currently, $1,260,008 of American Cancer Society research and special support is in effect in Missouri. Nationally, the society has spent nearly $300,000,000 for the support of projects, instituions and personnel involved in every important area of cancer research and clinical investigation.

Doctor Wang is one of five researchers who recently were awarded over $330,000 in ACS grants in Missouri. The others were Dr. Herschel J. Raskas and Dr. J. Wendall Davis, both of St. Louis University; Dr. Herman N. Eisen and Dr. Oliver H. Lowry, both of Washington University.

1973 (April 6) - NYTimes - "Human Blood and Marrow Cells Produced Inside a Living Mouse"

https://www.nytimes.com/1973/04/06/archives/human-blood-and-marrow-cells-produced-inside-a-living-mouse-human.html

1974-04-06-nytimes-human-blood-and-marrow-cells-produced-inside-living-mouse-human

April 6, 1973, By Harold M. Sch1vieck Jr. Special to The New York Times

WASHINGTON, April 5 — Scientists at Brookhaven National Laboratory have developed way of producing human blood and blood - forming cells inside a living mouse.

An announcement today from the laboratory at Upton, L.I., said the research makes it possible, for the first time, to duplicate the living, continuously functioning system of human blood cell reproduction outside the human body.

The method, is said to offer important possibilities for studying the complex process of blood formation in health and disease and for monitoring the effects of drugs. Since bone marrow is the main blood - forming tissue, the research might ultimately lead to a source of marrow for livesaving transplants. This is now only a theoretical possibility.

The blood cell formation takes place inside a small coinshaped chamber that is implanted inside the animal's abdominal cavity. The sides of the chamber are filters of extremely fine pore. This allows nutrient fluids from the animal to pass in and out, but prevents the cells inside from escaping and prevents the animal's cells from invading the chamber.

In the experiments, Dr. Eugene P. Cronkite, chairman of the laboratory's medical department explained by telephone today, only a small number of human bone marrow cells are put in the chamber. The number ranges between 1,000 and a million.

The chamber is then implanted in the mouse where the cells are allowed to grow for several weeks. At first, the total number of cells dwindles as the mature ones die, he said. Later the total grows to as many as 10 million and they differentiate into all the types found in normal marrow, the scientist said.

This includes not only the several different kinds of white blood cells, including scavenger cells and other immunologically active types, but also some red blood cells. Among the immunologically active cells are a type called plasma cells, which are normally responsible for generating protective antibodies.

Dr. Cronkite said they appear to be producing antibodies in the experiments at Brookhaven, but whether these are directed against something from the mouse or from the cell's original human environment is unknown.

The mouse is prevented from producing antibodies against the contents of the chamber by heavy doses of radiation given before the experiments begin. During the research, so far, mouse cells have been grown in chambers implanted in mice; rabbit cells in rabbits; goat cells in goats and human cells in mice.

Dr. Cronkit said other methods of growing bone marrow cells under artificial conditions were known, and used at many research centers, but that in general, these tended to produce only a few types of white cells and no red cells. Furthermore, unlike the system in use at Brookhaven, he said, the colonies of cells are not so easily studied during the process of growth and differentiation.

Several laboratories have also developed artificial substitutes for red blood cells, but research in this area is entirely distinct from the studies at Brookhaven on natural components of blood and the cells that form it.

Tool for Analysis

One of the advantages cited for the system is that the chamber can be removed at any time for study of its contents. Thus, the blood - formation process can be analyzed in some detail.

The scientists at Brookhaven have already used the system to grow cells from patients suffering from leukemia, a cancer of the blood - forming tissues, and hope that it may prove possible to test the effectiveness of drugs against such cells growing in the chambers.

Perhaps more important in the long run, they hope to study in detail the extremely complex process of blood formation itself as well as the derangements of the process that occur in leukemia and other diseases.

The research at Brookhaven is supported by the Atomic Energy Commission. It has been in progress since 1969, the announcement, said today, when Dr. Arne Boyum, a toxicologist from the Norwegian defense research establishment come to Brookhaven as a research collaborator in residence, bringing the basic idea with him.

Although Dr. Boyum returned to Norway more than two years ago, he is still an active participant in the studies, the announcement said. Other current collaborators with Dr. Cronkite in the research are Drs. Arland L. Carsten and Gundabhatktha Chikkapa. Two technical reports were published last year in an issue of Blood, a scientific journal, Dr. Cronkite said. Progress in the research has also been reported at scientific meetings.

A long - range goal of the studies is a system that would allow hone marrow to be readily produced for transplantation. This cannot be done with the present system.

Discovery of cell links excites cancer sleuths

N.Y. Times News Service

NEW YORK — Scientists at the University of Miami have found evidence that certain types of cells grown in a laboratory become cancerous, multiplying uncontrollably, when they lose the ability to form tiny channels linking them to neighboring cells.

Normally, adjoining human and animal cells are interconnected by such channels, or membrane junctions, big enough to permit the exchanle of smaller molescules but not proteins and other larger cell constituents.

Several types of cancer cells, however, lack the ability to form such channels. The Miami researchers have speculated that this prevented the cells from sharing some regulator substance that would have kept their growth within normal limits.

ALTHOUGH no such substance is known and nothing has yet been found to pass through the channels under natural conditions, the finding of a link between cancerous growth and the inability to make channels has led the researchers to suggest that they have discovered the first correlation between an abnormality of cell structure and the growthof tumors.

Much additional research must be done to establish whether the abnormality is, in fact, a cause of cancer and not just coincidental. Even then, the finding would offer no immediate help in the prevention or treatment of cancer.

It would, however, be of great significance in revealing a fundamental mechanism of normal cell life that can go awry and lead to cancerous growth. Most cancer researchers agree that, although there are many causes of cancer, all have the effect of removing or overriding the cells' controls on their own ability to multiply.

The Miami finding is the latest development in a 14-year research effort led by Dr. Werner R. Loewenstein, chairman of the department of physiology and biophysics at the University of Miami School of Medicine.

LOEWENSTEIN is credited with the discovery that membrane junctions are capable of transmitting electrical currents from cell to cell and of passing small molecules, such as those of marker dyes injected into individual cells by scientists.

Although no function for the junctions has been established, it is theorized that they are channels by which cells exchange with one another the chemical or electrical information believed to be necessary for them to work in concert.

Loewenstein believes a better understanding of the membrane junctions may shed light on such questions as how cells in an embryonic liver, for example, know when to stop multiplying so that the liver does not fill up the entire abdomen. Somehow, the cells know when the organ has reached its proper size and stop multiplying.

When a portion of the liver or other organ is damaged, however, the surviving cells somehow learn that they are to resume multiplying to replace the lost cells. Once the damage is repaired, they stop again.

IN BACTERIA, it is known that the genes, the molecules bearing the coded instructions for cell activities, can be switched on and off by relatively small molecules within the cell. Similar regulator substances have not been found in higher organisms, but Loewenstein and others suspect they exist.

There is evidence from studies of developing embryos that the process by which undifferentiated cells take on specialized shapes and functions — as a liver cell or a muscle cell, for example — involves the apparent diffusion of substances from one cell to another.

The experiments linking the membrane junctions to cancer were done with cells from a common type of mouse tumor. These cells, like those of some forms of cancer, lack the ability to form membrane junctions, or channels.

According to the theory, such a cell would be unable to learn that there were any cells like it nearby. It would behave as if its neighboring cells had been destroyed, and would keep multiplying indefinitely.

Loewenstein and his colleague at Miami, R. Azarnia, took such tumor cells and fused them, one by one, with normal human cells that could form membrane junctions, producing human-mouse hybrid cells. Under laboratory conditions, such artificial hybrids can live and reproduce, making use of chromosomes from both species. Cell hybrids are used routinely in several areas of research.

In the Miami experiments, the hybrid cells inherited the normal cell's ability to form membrance junctions, and did so within minutes after contact with other cells. When the tumor cells were injected into mice, they produced cancerous tumors, but when the hybrid cells were similarly injected, they did not.

ALTHOUGH human-mouse hybrid cells reproduce themselves at normal intervals, they have a tendency to lose one or more human chromosomes every so often as successive generations of cells are produced. Eventually, the hybrid reverts to being a mouse cell.

Loewenstein tested successive generations, both for their ability to cause tumors and to form the channels to other cells. He found that, as soon as the hybrid lost the chromosome that enabled it to make the channels, the cell also became cancerous.

"In every case," the scientist wrote in the latest issue of The Journal of Membrane Biology, "reversion to the channel defect went hand in hand with reversion to the growth defect, just as, in the early-generation hybrids, correction of the channel defect went hand in hand with correction of the growth defect."

This finding is not proof that the loss of the membrane junctions was the actual cause of the cancerous growth. It may be that the chromosome containing the channel-forming instructions also contains other genes that keep cell multiplication at a normal rate. When the chromoso is lost, both results would appear simultaneously.

Even if the channel defect is eventually proved to be the fact or that makes some cells grow into tumors, Dr. Loewenstein notes that there will certainly remain other unknown mechanisms by which cancer can start. Some types of cancer cells, for example, are able to form perfectly good membrane junctions. In these cases, the defect could be in the ability to form the signal molecule or to receive it, or in the cell's ability to respond to the signal.

There may also be entirely different systems for regulating cell growth that can be disrupted by carcinogenic chemicals, viruses, radiation and other known causes of cancer.

1988 (April 13) - NYTimes : "Harvard Gets Mouse Patent, A World First"

https://www.nytimes.com/1988/04/13/us/harvard-gets-mouse-patent-a-world-first.html

1988-04-13-nytimes-harvard-gets-mouse-patent.pdf

By Keith Schneider, Special To the New York Times / April 13, 1988

Calling it a "singularly historic event," the United States today issued to Harvard University the world's first patent for a higher form of life, a mouse specially developed by researchers at the Harvard Medical School through techniques of genetic manipulation.

The United States Patent and Trademark Office issued patent No. 4,736,866 for "transgenic nonhuman mammals" developed by Dr. Philip Leder, a 53-year-old geneticist at Harvard Medical School, and Dr. Timothy A. Stewart, 35, a former Harvard researcher who is a senior scientist at Genentech Inc., a leading biotechnology company in South San Francisco.

The two scientists isolated a gene that causes cancer in many mammals, including humans, injected it into fertilized mouse eggs and developed a new breed of genetically altered mice. An Effective Research Model

Because half the females develop cancer, the altered breed serves as a more effective model for studying how genes contribute to cancer, particularly breast cancer, Dr. Leder said.

Other experts said the invention presented scientists with a more efficient biological system for testing new drugs and therapies to treat cancer, and for determining whether chemicals and other toxic substances found in food or the environment are harmful.

The announcement elated researchers and biotechnology industry executives who said it would attract more investments for research and lead to safer and more effective biological inventions in medicine, agriculture, forestry and other industries.

But critics, including several powerful members of Congress, protested the decision, arguing that a handful of officials appointed by the Reagan Administration had in a single act determined a new and important public policy without a public debate and in defiance of a request from Congress to delay the action.

Donald J. Quigg, the Assistant Secretary of Commerce, who is also Commissioner of Patents, said approving the animal patent was a logical and lawful extension of previous decisions by the 198-year-old agency. In 1930 the first patent for a crop plant was approved. In 1980 the Supreme Court ruled that scientists could patent genetically altered microorganisms. A year ago the Patent Office announced that it would allow inventors to patent new forms of animal life created by gene-splicing and other biological technologies.

Mr. Quigg said today that the 13th Amendment prevented the patenting of human beings. Patent attorneys said, however, that portions of the human genetic code, including specific genes, will be patentable. 'Can Anyone Say This Is Wrong?'

Mr. Quigg said the potential of the altered mice to hasten the development of treatments for cancer was an important factor in granting Harvard the first animal patent, which allows the inventor the exclusive right to use a product for 17 years. "I know I'm not supposed to get on a soapbox," he said in an interview today, "but how can anybody say this kind of development is unethical or wrong?"

But some members of Congress protested, and in a letter to be sent later this week after more signatures are sought they called on the Patent and Trademark Office to refrain from issuing another animal patent. The office said 21 patent applications for genetically engineered animals are pending.

Both the House and Senate are considering legislation that would impose a moratorium on approving patents for genetically altered animals. It would be in force until Congress has more thoroughly considered a range of economic and moral issues raised in the last year by farm groups, religious leaders, animal welfare organizations and environmental groups. Quickening Pace in Field

The Patent Office decision recognizes the quickening pace of developments in biotechnology, particularly in creating and duplicating new forms of animals. Along with genetically engineered pigs, cattle and sheep that have been produced in laboratories across the country, scientists are also beginning to transform aquatic species.

Critics found today's action cause for concern. Jeremy Rifkin, president of the Foundation on Economic Trends in Washington, who is a leader of the coalition that seeks to halt animal patents, said: "For the first time, the Patent Office has formulated a public policy and taken the authority of Congress in their own hands."

Other experts saw dangers if Congress interferes in the Patent Office's procedures. Robert P. Merges, a patent specialist at Columbia University School of Law, said, "Is Congress now going to say, for the first time, that here's a new technology that we're going to delay because we're going to presume it's bad until it's proven good?"

1988 (Sep 15) - NYTimes : "Human Immune Defenses Are Transplanted in Mice"

https://www.nytimes.com/1988/09/15/us/human-immune-defenses-are-transplanted-in-mice.html

1988-09-15-nytimes-human-immune-defenses-are-transplanted-in-mice.pdf

By Harold M. Schmeck Jr. /= Sept. 15, 1988

Scientists have transplanted the major elements of the human immune defense system into living mice, a stunning achievement that should provide a powerful new tool for medical research.

Describing the new experiments as "exciting" and "incredible," leading researchers predicted that the technique will have many important uses, including the study of AIDS and leukemia and the testing of treatments and vaccines. The altered mice are also expected to give scientists, for the first time, a direct way of studying the development of the human immune system and its functions.

The mice lack natural immune defenses of their own, but circulating in their blood is the full spectrum of human white blood cells, which play key roles in warding off infection and produce human antibodies in response to infectious agents. Work of Separate Teams

These human attributes have been produced in mice by two research teams working independently of each other and using different methods. Although the research is considered highly promising, it is still in an early stage at both institutions involved.

Researchers at the Medical Biology Institute, an independent research center in La Jolla, Calif., reported today in the journal Nature that they had produced mice that had the major functional elements of the human immune defenses. They did this by injecting the animals with purified lymphocytes, immune defense cells, from normal human adults. The cells, injected into the abdominal cavity, reproduced and migrated throughout the blood and lymphatic systems.

Dr. Donald E. Mosier, leader of the research team, said the human immune defenses had persisted in some mice for as long as eight months so far. When such animals were injected with tetanus toxoid, used to produce immunity against tetanus bacteria, the animals developed human antibodies against the bacteria. The experiments also produced evidence of activity by the other fundamental arm of the human immune defenses, cell mediated immunity, which is mainly produced by two classes of cells: T cells and B cells. Surprisingly Simple Technique

The method of transplanting the immune defenses was relatively simple, but the scientists had hardly expected it to succeed. The normal expectation was that the transplanted human tissue would attack the mouse's body in a process, graft-versus-host disease, that is often fatal. Although there was some graft-versus-host disease, it was less destructive than expected.

The other research team, led by Dr. Joseph M. McCune and Dr. Irving Weissman of Stanford University, succeeded in a much more formidible task: transferring the entire human immune defense system into mice by transplanting human fetal tissues that are responsible for the development of the complete human blood-forming and immune system.

The team has developed a colony of more than 200 of the mice that have human immune defenses, according to a report that will be published in the journal Science. The scientists are not yet certain how complete the transplanted defenses are. But mice that would ordinarily die within three to four months because they lacked immune defenses, became healthy and have survived as long as 15 months to date. Among other things, they withstood pneumocystis carini infections, a major cause of death among AIDS patients.

The Stanford researchers will report on their experiments in next week's issue of Science, but the editors of that journal permitted the results of the study to be described in advance so that the two reports could be made public at the same time. Use of Fetal Tissue

The scientists at Stanford injected the mice with small amounts of fetal liver and lymphatic tissue as well as fetal thymus and spleen; all of them tissues vital to formation of blood and immune defenses. The tissues were obtained after abortion with the consent of the women involved. The use was approved by Stanford panels that regulate human and animal research. The work did not violate any Federal rules, Dr. Weissman said.

Only small amounts of tissue were needed and they were obtained before the current moratorium on Federal support for fetal research. The scientists at Stanford received support from the National Institutes of Health for the mouse research.

Crucial to both research teams was a breed of mice called SCID, for severe combined immune deficiency, that are almost totally lacking in immune defenses of their own. Because the animals lacked defenses, they did not reject the foreign human tissues. The breed of mice was discovered five years ago by Melvin J. Bosma and Gayle C. Bosma, a husband and wife research team at the Fox Chase Cancer Center in Philadelphia.

Dr. Anthony S. Fauci, director of the National Institute of Allergy and Infectious Diseases, in Bethesda, Md. said the research by both groups was important. Dr. Fauci, an expert on both immunology and AIDS, described the experiments as "very exciting work" that "has major potential for being able to establish a small-animal model of the human immune system." Possible Insight on AIDS

For example, he said, the mice may allow direct step-by-step studies of the manner in which the AIDS virus attacks cells of the human immune defense system. Such animals may also prove valuable for testing new drugs and new vaccines for AIDS and other important diseases.

At present there is no animal in which the acquired immune deficiency syndrome produces precisely the same effects that it does in humans. Chimpanzees, the closest animals to humans that can be infected with the HIV virus, are in short supply and do not develop an equivalent disease to AIDS. Whether the mice will do so is not yet known, but the scientists believe they will at least be able to follow the progression of the virus infection on cells of the human immune system in a direct manner that has not previously been possible. Research Termed Remarkable

In a commentary written for Science, Dr. George D. Yancopoulos and Dr. Frederick W. Alt, of Columbia University, described the research at Stanford as "remarkable." They said animals in which the immune defenses have been manipulated in various ways permit many important studies of the way in which the immune system functions.

"The Weissman group now report remarkable experiments that appear to push this system to its incredible but logical extreme," they said.

Authors of the report from Stanford with Dr. Weissman and Dr. McCune were Dr. Reiko Namikawa, Dr. Hideto Kaneshima, Dr. Miriam Lieberman of Stanford and Dr. Len Shultz of the Jackson Laboratory in Bar Harbor, Me.

Authors of the Nature article with Dr. Mosier are Dr. Richard J. Gulizia and Dr. Darcy B. Wilson of the Medical Biology Institute and Dr. Stephen M. Baird of the Veterans Administration Medical Center in La Jolla.

Scientists test drugs on 'humanized mice'

By Sandra Blakeslee
The New York Times

In a series of bold experiments, scientists have created laboratory mice with tiny human organ structures — lungs, intestines, pancreases, lymph nodes, thymuses, livers and immune systems. The purpose is to study the viruses of human diseases in living human tissues.

The animals, whose organ tissues are derived from those of human fetuses, provide a singular opportunity to gauge the effectiveness of various antiviral drugs. The mice have been successfully infected with the AIDS virus and with two cancer viruses that cause leukemia.

Researchers plan next to infect the mice with cytomegalovirus, which can damage the brains of unborn children. After that will come infections with the viruses of influenza, chronic infant diarrhea, genital warts and hepatitis. Because these viruses attack only humans, it has so far been impossible to study them in animals.

The organ structures are not miniature carbon copies of adult organs but contain complete structural subunits of each organ and carry out the organ's normal functions in duplicate with the mouse's own.

The novel mice were developed by Dr. Michael McCune, an immunologist who treats AIDS patients at San Francisco General Hospital.

A second kind of mouse, carrying adult human blood cells, has been developed by Dr. Donald Mosier, an immunologist from the Medical Research Institute, a private research laboratory in La Jolla, Calif.

Both scientists announced their inventions two years ago and have made strides since then in developing the mouse-human hybrids.

Because human fetal tissues are being implanted into animals and not humans, McCune and his colleagues are not subject to the U.S. federal ban on the use of such tissues in medical research.

The ban, imposed two years ago by the Department of Health and Human Services, was intended to prevent women from having abortions for the sake of donating fetal tissue to people, but the regulations make no mention of mice, said McCune, whose work has been financed largely by the National Institutes of Health.

1990 (Oct 30) - NYTimes - "New Medical Research Tool: Human Tissues in Lab Mice"

1990-10-30-nytimes-new-medical-research-tool-human-lab-mice.pdf

By Sandra Blakeslee / Oct. 30, 1990

In a series of bold experiments, scientists have created laboratory mice with tiny samples of human organs growing in them: lungs, intestines, pancreases, lymph nodes, thymuses, and livers. The purpose is to study the viruses of human diseases in living human tissues.

The mice provide a singular opportunity to gauge the effectiveness of various antiviral drugs. They have been successfully infected with the AIDS virus and with two cancer viruses that cause leukemia.

Researchers plan next to infect the mice with cytomegalovirus, which can damage the brains of unborn children. After that will come infections with the viruses of influenza, chronic infant diarrhea, genital warts and hepatitis. Because these viruses attack only humans, it has been impossible hitherto to study them in animals. Not Carbon Copies

The organ structures are not miniature copies of adult organs but contain complete sets of cells that make them able to function as well as the organs of a newborn baby.Thus, each organ, about the size of a pencil eraser, can carry out its normal function in tandem with the mouse's own organs.

The novel mice were developed by Dr. J. Michael McCune, an immunologist who treats AIDS patients at San Francisco General Hospital.

A second kind of mouse, carrying adult human blood cells, has been developed by Dr. Donald E. Mosier, an immunologist from the Medical Research Institute, a private research laboratory in La Jolla, Calif.

Both scientists announced two years ago that they had implanted human immune system tissues into immune deficient mice and reported the mice formed human white cells. Since then, they have learned how to grow other organs in mice and to infect the animals with human viruses. Many of those experiments are being carried out by companies recently formed by Dr. Mosier and and Dr. McCune. Researchers at Duke University, Stanford University and the University of California at Los Angeles have also replicated the work.

Because human fetal tissues are being implanted into animals and not humans, Dr. McCune and his colleagues are not subject to the Federal ban on the use of such tissues in medical research. The ban, imposed two years ago by the Department of Health and Human Services, was intended to prevent women from having abortions for the sake of donating fetal tissue to people, but the regulations make no mention of mice, said Dr. McCune, whose work has been financed largely by the National Institutes of Health. Important New Tool

The mouse "is potentially quite an important model" for studying AIDS and other viral diseases, said Dr. Anthony S. Fauci, director of the National Institute of Allergy and Infectious Diseases in Bethesda, Md. The mouse is "phenomenally important," said Dr. David Baltimore, president of the Rockefeller University in New York. "It offers you the opportunity to look at viruses without having to deal with human beings" and to conduct imaginative experiments. Dr. Baltimore helped form Dr. McCune's company, Systemix of Palo Alto, Calif., two years ago.

Dr. McCune said his notion for creating the mouse was born of frustration. In his work with AIDS patients, he developed concepts for therapies that needed to be tested in animals, yet the AIDS virus infects only human cells. His idea was to insert tissues from human fetal organs into mice with deficient immune systems that would not reject the implants. Such mice had been developed at the Fox Chase Cancer Center in Philadelphia.

To create mice with human immune systems, Dr. McCune takes the thymus, liver and lymph nodes from human fetuses less than 22 weeks old and divides them into hundreds of pieces, each about the size of a grain of rice.

Using a microscope, he implants a piece of each organ under the kidneys of young mice. Within days, the mouse's blood vessels move into the human tissue, nourishing it and encouraging it to grow. In a month or two, the human organs are the size of blueberries and are able to engender the cells of the immune system.

Though small, the organs are functionally complete, Dr. McCune said. Human immune T-cells circulate in the mouse's bloodstream, he said, while B-cells and other human immune system components reside in the liver and thymus.

Dr. Mosier's company, Lidak Pharmaceuticals in La Jolla, Calif., makes an immune deficient mouse that supports immune system cells taken from adult humans. Dr. Mosier injects white blood cells from adult donors into a mouse's abdominal cavity. The cells migrate to the mouse's spleen and lymph nodes and create a functioning human immune system. For reasons that are not understood, Dr. Mosier said, the human cells do not attack the mouse's tissues. Trials With AZT

Such mice are being studied under a wide range of experimental conditions, said Dr. McCune. In one experiment, which is to be published shortly, researchers treated mice with the drug AZT at different intervals after infection to test the advantages of early treatment. The answer may help guide the treatment of hospital workers who accidentally stick themselves with AIDS-contaminated needles, Dr. McCune said.

Hundreds of antiviral compounds are being screened in both versions of the mice. Because the AIDS virus mutates rapidly, the researchers plan to test combinations of the most promising drugs.

At Stanford University, Dr. Edwin Mocarsky plans to infect mice with cytomegalovirus, an organism that can cause blindness in AIDS patients. At U.C.L.A., Dr. Irvin Chen is studying two human leukemia viruses to find out how the virus transforms human cells into a cancerous state.

Scientists at Systemix are beginning to implant other human organs in the mice, including lungs, intestines, pancreases, pituitary glands, skin, brain cells and placenta. The work is in very early stages, but so far the tissues have correct structural elements and a healthy blood supply, said Dr. McCune. "The only thing holding us back is having enough hours in the week to do the experiments," he said.

Certain brain cells and pituitary gland cells grow well in the mice, Dr. McCune said, as do beta cells and islet cells of the pancreas. But a major goal of the research, he said, is to isolate the human blood stem cell -- a master cell that gives rise to all the various types of blood and immune cells.

Possible stem cells will be inserted into mice whose human blood-forming system has been destroyed by radiation. Real stem cells should then disclose their identity by regenerating blood and immune cells. "You just can't do this experiment in people," Dr. McCune noted.

Human stem cells will be invaluable for gene therapy, he said, and for isolating blood growth factors for treating cancer and other diseases.

Dr. McCune said the research has not encountered any opposition from anti-abortion or animal rights groups. A Mouse With Tissues Of a Human When a deficient immune system gets implants of fetal thymus, liver and lymph nodes cells, the tissue is not rejected. Instead, the mouse's blood vessels nourish it, and human organs the size of blueberries develop. They function along with the organs of the mouse and make cells of the human immune system, including T-cells that circulate in the mouse's bloodstream and B-cells and other immune cells that reside in the liver and thymus. The mice can be used to study viral activity in human tissue and anti-viral drugs.

THE OTTAWA CITIZEN • SUNDAY, NOVEMBER 4, 1990 A9

CHARLES GORDON
Citizen staff

A sudden urge for tiny little fondue sets

We live in a world so dulled by television, so sated by science fiction that it takes a pretty sensational scientific development to make it onto the front page.

Space satellites, two-headed calves and the like — what *is* the like of a two-headed calf, come to think of it — don't even make the *back* pages any more, so blasé have we become about the march of human progress.

Still, when humanized mice appear, you have to sit up and take notice. "*U.S. scientists develop tiny human-like organs in mice*" said the headline and under it was a story about these humanized mice, from the *New York Times*.

Actually, the mice were not from the *New York Times*; only the story was.

"In a series of bold experiments," the story began, "scientists have created laboratory mice with tiny human organ structures."

The science-literate will recognize the formula — the mice, laboratory, the bold experiments — and read on. But newcomers to the field will have some questions. One is: What's so bold about experimenting with mice?

Little creatures, never hurt a flea. And when you come right down to it, don't the mice have to be a lot bolder than the scientists? After all, no one is creating scientists with mouse organs — perhaps to avoid having them chased by Harmonicats.

By way of clarification, the story goes on to say that the purpose is to study the viruses of human diseases in living human tissues in order to gauge the effectiveness of various antiviral drugs. Newspapers are usually more interested in the bizarre nature of scientific experimentation than the purposes of the experiments, but put in paragraphs of explanation at the request of scientists who don't want the public to think that they just like fooling around with mice.

Having got that out of the way, newspaper editors then begin seeking to satisfy what they perceive as the curiosity of their readers. Reporters are set to work answering the *really* important questions, such as:

- Can these mice, like, play the piano?
- Do they have souls?
- Would they be able, at some point, to read the newspapers.

There are also ethical questions. Newspapers dealing with advances in science are big on ethical questions and constantly bother university professors in the theology department for answers.

And it *is* an ethical matter, developing mice with human organs. It sheds an entirely new light on the question: Are you a man or a mouse?

So there are matters of right and wrong to be addressed, among them, can humanized church mice be ordained?

And another: Should the compound adjective "mickey-mouse" be taken from the language because of its derogatory, mousogynist connotations.

In the sense of medical ethics, should humanized mice be forced to carry the full set of human organs? In other words, would it be all right to skip some of the things, like appendixes and funny bones, that have never given humans anything but trouble.

These are difficult problems, filled with theological considerations and everything. But science doesn't stop to consider the trouble it creates. It just invents stuff and moves on. Heaven knows where we'd be if it weren't for the newspapers.

1991 (April 19) - NYTimes "Mice Are Altered to Help Humans Fight Disease"

https://www.nytimes.com/1991/04/19/us/mice-are-altered-to-help-humans-fight-disease.html

1991-04-19-nytimes-mice-are-altered-to-help-humans-fight-disease

By Gina Kolata

For the first time, scientists have created mice with fully functioning human immune systems by replacing the mice's bone marrow with human bone marrow. Researchers expect that the mice will be able to make human antibodies to order and could be testing grounds for vaccines and AIDS drugs.

The mice could be the missing link between test tube experiments, which often fail to reflect what happens in people, and studies in humans, which are expensive, difficult and often risky.

As far as their immune systems go, the mice are "humans with fur," Dr. Andrew Saxon, an immunologist at the University of California at Los Angeles, said in a telephone interview this week. Boon to AIDS Researchers

The mice could be particularly important to AIDS researchers because they produce the human immune system cells the AIDS virus attacks. Thus researchers could use them to speed the testing of vaccines and new drugs in experiments that would be too dangerous for humans. The mice could also be used as factories to make antibodies for transfer to humans to fight diseases.

Previous attempts to establish human immune systems in mice were of limited use because the methods were too complicated and because the immune systems did not function normally. But experts said they had high hopes for the new technique because it is simple and for the first time the mice produced a full array of circulating human immune cells.

The work, by Dr. Yair Reisner and his colleageus at the Weizmann Institute of Science in Rehovot, Israel, was reported today in the journal Science.

"This is really quite exciting," said Dr. Jerome Groopman, an AIDS researcher at the New England Deaconess Hospital in Boston. "It's a whole new field of biology."

Dr. George Santos, who directs the bone marrow transplant unit at Johns Hopkins University in Baltimore, agreed. "I really think it's an advance," he said.

The spongy red bone marrow makes red blood cells, which carry oxygen; platelets, which help blood clot, and the body's entire repertoire of disease-fighting white blood cells, the heart of the immune system.

Dr. Reisner and his colleagues began by destroying mice's own bone marrow cells with high doses of radiation. This erased the mice's immune systems so that the animals had no cells that could attack the foreign marrow, and also created a cavity in the marrow where new cells had room to grow.

Then, the scientists dripped human marrow cells into the slender veins of the mice. The human cells moved into the bones of the mice and took up residence there.

To help the mice survive until the human marrow began producing red blood cells, the mice were given transplants of mouse marrow from a strain whose marrow can make red blood cells and platelets but not white cells.

A past attempt to create mice with human immune systems was to transplant human fetal organs onto the kidneys of mice that are genetically incapable of making their own white blood cells. The fetal organs constituted an entire fetal immune system. But that approach proved tricky. It was hard to keep the mice alive, and even when the method worked, the human white blood cells remained in a puddle near the kidney.

A second method was to inject human white blood cells directly into the abdomens of mice that lack immune systems. But the transplanted cells lived for a just few months before petering out and never generated new cells.

The new method, said Dr. Saxon, has the advantage of being simple and easy for others to reproduce. The mice make circulating white blood cells, make antibodies and make new cells.

Dr. David Golde, an immunologist at the University of California at Los Angeles, said that it could even be possible to maintain immmune system cells in the mice and isolate those cells that are the best disease fighters. The idea, he said, would be to transplant your marrow into a mouse, train the white blood cells, take the cells out of the mice and put them back into yourself.

Dr. Groopman said he would like to see the mice used for two purposes. One, his own special interest, would be to study AIDS. Since the mice make white blood cells of the sort that the AIDS virus infects, it should be possible to study AIDS in the animals and to test AIDS drugs and vaccines in them. The virus that causes acquired immune deficiency syndrome only infects human cells.

A second possible boon would be to use the mice as factories to produce human antibodies to fight disease. Molecular biologists have found ways to isolate mouse cells that will churn out potent antibodies, but the use of these monoclonal antibodies that have one parent cell has been limited because people develop allergies to the mouse proteins

The next step, scientists said, is for others to repeat Dr. Reisner's experiments.

1994 (May 03) - NYTimes : "Pure Human Antibodies Reported From Mice"

By Warren E. Leary / May 3, 1994

https://www.nytimes.com/1994/05/03/science/pure-human-antibodies-reported-from-mice.html?searchResultPosition=17

1994-05-03-nytimes-pure-human-antibodies-reported-from-mice

TWO groups of scientists working separately say they have prepared genetically altered mice that can be used to produce human disease-fighting antibodies of unusual purity.

In a technically daunting technique, the mice's own antibody-making genes were knocked out and replaced with the equivalent genes from humans. When such a mouse is injected with a foreign substance like a virus or bacterium, its immune system generates antibodies against the invader in the usual way, except that these are human and not mouse antibodies.

The advantage is that the antibodies, after being mass-produced outside the mouse by another method, called the hybridoma technique, can be injected into humans in hope that it will cause far less of an immune reaction than the mouse's own antibodies, which the human immune system attacks as a foreign protein.

To produce the antibodies in bulk, the mouse cells that produce them are removed from the spleen and fused in the test tube with a special kind of cancerous cell that immortalizes them. Each clone of cells produces a single, pure antibody, known as a monoclonal antibody. The procedure, known as the hybridoma technique, was invented in 1975 but until now has proceded in mice that made conventional mouse antibodies.

If the mouse-made human monoclonal antibodies work as well against diseases in people as laboratory tests indicate, researchers said, the findings could revitalize interest in using these antibodies as "guided missiles" against cancer, arthritis and other maladies.

Two Different Approaches

Scientists at two competing California biotechnology companies report that they have produced mice equipped to make the human antibodies.

In a report in the current issue of the journal Nature, scientists from GenPharm International in Mountain View, Calif., said cell lines from these so-called transgenic mice made antibodies that appeared so human that the human body should ignore them long enough to be medically useful.

"We are now routinely using our transgenic mouse system to generate a range of novel, completely human monoclonal antibodies and expect that many of these will have significant therapeutic potential," said Dr. Robert M. Kay, GenPharm's vice president for research and development.

The GenPharm team, led by Dr. Nils Lonberg, used a form of genetic targeting to remove major mouse immune system genes. The researchers also injected pieces of DNA containing human immune genes into single-cell mouse embryos and produced animals that carried the human genetic information. The report said the researchers mated the two kinds of mice and produced offspring that constituted a new strain with human antibody genes replacing almost all of the mouse antibody genes.

When members of this new strain were injected with a target protein, the report said, most of their antibody-making cells produced human antibodies. These "humanized" cells were then removed and cloned with tumor cells to make a cell line that produced pure human monoclonal antibodies, the researchers said.

Researchers from Cell Genesys Inc. in Foster City, Calif., in an article in the current issue of Nature Genetics, also said they had produced human monoclonal antibodies from mice, using a different approach. The reports from both research groups were submitted for publication within a week of each other last December.

The Cell Genesys researchers, led by Dr. Aya Jakobovits, used a technique called "yeast artificial chromosomes," or YAC, to place human immune system genes into their mice. With this method, the genetic material of yeast is used as a carrier for large human genes. The group used YAC's to fuse the human DNA into mouse embryo cells, and subsequent generations of the animals incorporated the human genetic material. Breeding these animals with others that had had their mouse immune genes removed produced a strain that made human antibodies, and cells from these animals were used to produce test-tube cultures of monoclonal antibodies, the report said.

A major question remaining about both developments is whether these antibody products retain enough mouse characteristics for the human body to see them as foreign, experts said.

While neither company would say specifically what types of monoclonal antibodies it was focusing on as potential therapeutic products, Cell Genesys said that some of its mice made antibodies to a protein involved in a number of acute inflammatory disorders, including tissue injury from trauma, and that other antibodies might be directed against allergic reactions. GenPharm officials said they had formed a partnership with a major drug company to investigate antibodies associated with cancer.

1995 (July 4) - NYTimes : "Protein Labs' Stock Slides After Setback"

By Lawrence M. Fisher / July 4, 1995

https://www.nytimes.com/1995/07/04/business/protein-labs-stock-slides-after-setback.html?searchResultPosition=18

1995-07-04-nytimes-protein-labs-stock-slides.pdf

Shares in Protein Design Labs Inc. lost one-third of their value today following the company's announcement late Friday that its lead drug had failed in advanced clinical trials.

Protein Design shares tumbled $6.875, or 33 percent, to $13.875 in Nasdaq trading. The stock had reached a 52-week high of $26.75 earlier this year.

Protein Design, a biotechnology company based in Mountain View, Calif., and Hofmann-La Roche Inc., its corporate partner, announced after the market's close on Friday that their jointly developed monoclonal antibody, Zenapax, had not been effective in the prevention of graft-versus-host disease, a common complication involving the rejection of bone marrow transplants. Hofmann- La Roche, based in Nutley, N.J., is a unit of Roche Holdings Ltd. of Switzerland.

Roche said it planned to continue two Zenapax trials to evaluate the drug's efficacy in preventing acute rejection of kidney transplants.

Concerning the safety of the drug, the two companies said their preliminary analysis indicated that the safety profile for Zenapax associated with graft-versus-host disease was good, with only two reports of serious adverse effects.

Cary L. Queen, Protein Design's vice president for research, said in a telephone interview that it was difficult to extrapolate the prospects of the drug from a trial for one disease to another. "Graft-versus-host disease is a very difficult indication and has a very high mortality rate," he said. "We think kidney transplant is a less challenging indication." he said. Early trial data regarding kidney transplants was encouraging, the company said.

In the graft-versus-host trial, only one patient among 140 treated developed an immune response to the drug, Mr. Queen said. That indicated that Protein Design's technology for "humanizing" antibodies derived from mice was effective. The response to the so-called human anti-mouse antibody has limited the possible uses of traditional monoclonal antibodies.

The failure of Zenapax in graft-versus-host disease was "very surprising from the standpoint that Roche has been very bullish about this molecule in this indication and in kidney transplant," said Edmund Debler, an analyst with Mehta & Isaly. He noted that Roche had gone from a 24-patient study for the treatment of the disease to a 210-patient study for its prevention, an uncharacteristic jump for a large pharmaceutical company. "They went down the classic biotech path to a failed trial," he said.

Protein Design has two other monoclonal antibodies, both derived from humans, for the treatment of hepatitis B and cytomegalovirus, in a collaboration with Corange, the German pharmaceuticals conglomerate. Both of these molecules have been delayed by as much as one year in clinical trials because of difficulties in manufacturing.

Corange owns 15 percent of Protein Design Labs and Hofmann-La Roche 8 percent. Mr. Queen said the company has $110 million in cash.

1995 (Oct 16) - NYTimes : "Patents;In the struggle to alleviate the pain of rheumatoid arthritis, a doctor says he has taken a step forward."

https://www.nytimes.com/1995/10/16/business/patents-struggle-alleviate-pain-rheumatoid-arthritis-doctor-says-he-has-taken.html?searchResultPosition=19

1995-10-16-nytimes-struggle-to-alleviate-pain-of-rheumatoid-arthritis

By Teresa Riordan, Oct. 16, 1995

Occasionally the digitization process introduces transcription errors or other problems; we are continuing to work to improve these archived versions.

A NUMBER of drug companies are pressing to develop an inflammation-blocking drug that will alleviate, without side effects, the symptoms of rheumatoid arthritis, a chronic disease that afflicts two million Americans. Such a drug could be worth hundreds of millions of dollars annually and might be prescribed to treat other autoimmune diseases like multiple sclerosis.

The aim is to suppress the activities of a protein known as tumor necrosis factor, or T.N.F., which normally helps jump-start the immune system but sometimes goes haywire. In the case of rheumatoid arthritis, T.N.F. starts a series of events that can result in irreversible damage to the body's joints.

In 1985 Dr. Bruce A. Beutler, now an investigator at the Howard Hughes Medical Institute and an associate professor of internal medicine at the University of Texas Southwestern Medical Center in Dallas, was one of the first scientists to isolate and clone T.N.F. Dr. Beutler has now received a patent covering what he contends is the most effective way to thwart the wayward protein.

There are several possible ways to block T.N.F. One is to administer monoclonal antibodies, large Y-shaped proteins that originate from the immune cells of mice. These antibodies bind to the T.N.F. and neutralize it. Centocor Inc. is taking this approach, as are other companies.

The problem with this method, Dr. Beutler contends, is that even when these antibodies have been "humanized," the body will recognize them as being foreign in origin and eventually will produce its own antibodies that will nullify any therapeutic effect. "Rheumatoid arthritis is a lifelong illness, so you need a drug that will work for years and years," Dr. Beutler said.

Dr. Beutler's approach is to splice two genes together to produce a new gene that codes for a Y-shaped molecule that is essentially an artificial monoclonal antibody. The two arms of the Y are T.N.F. receptors; the stem of the Y is a fragment of a normal human antibody.

"It's a thousand times more potent in neutralizing T.N.F. than a typical monoclonal antibody would be," Dr. Beutler said. "Another important advantage is that it is made of pieces of two molecules that already exist in the human body, so it is invisible to the immune system. It's very probable that this could be given indefinitely, just as human insulin is given to diabetics.

Hoffmann-LaRoche, a unit of Roche Holding Ltd., and the [**Immunex Corporation**] are testing a similar concept clinically; patent attorneys at both companies said they were not aware of Dr. Beutler's patent.

"We actually own the molecule -- or at least we think we do," Dr. Beutler said.

Ray Wheatley, director of technology transfer at the Southwestern Medical Center in Dallas, said the university had not spoken yet with any companies about the patent. "We haven't tried to market it yet, but our patent could be seen as being very powerful," he said.

Dr. Beutler, Karsten Peppel and David F. Crawford received patent 5,447,851, which was assigned to the University of Texas.

1996 (July 07) - NYTimes : "ENCOUNTERS;In the Maelstrom of Animal Medical Studies"

https://www.nytimes.com/1996/07/07/nyregion/encounters-in-the-maelstrom-of-animal-medical-studies.html?searchResultPosition=20

1996-07-17-nytimes-in-the-maelstrom-of-animal-medical-studies.pdf

By Erika Duncan , July 7, 1996

ALREADY, when you make a first impression, you are preparing the groove for a memory. And so I will remember Dr. Jan Moor-Jankowski, world expert in the scientific use of chimpanzees, standing in a doorway, in a stiff rather military dress jacket with brass buttons, with a portable telephone in each hand, his tall body at peace somehow with the low ceilings and walls of this early 19th century whaler's cottage in Orient.

I did not know how I would feel about the moral issues involved in his kind of animal testing. He had done some of the ground-breaking work that allowed monkeys and apes to survive and to breed in a medical testing environment. He also was a central figure in a significant libel case, defending the right of letters to the editor to the protection of the First Amendment. And he was also a key person in a dispute with New York University, which gave his laboratory in Sterling Forest, N.Y., to his arch foe in the world of animal experimentation and dismissed him from his post as director.

Before the late 50s, when Jan came onto the scene, most work with monkeys had been behavioral. Monkeys were usually allowed to die once experimentation was done, and many died along the way from diseases.

Jan, who became the director of the World Health Organization's Collaborating Center for Hematology in Primate Animals, designed cages based on the wire-bottomed chicken coops then in use in America, so apes and monkeys could be kept away from their feces.

A medically trained physician, he was committed to creating conditions as humane as possible during the testing situations. He was, from the beginning, opposed to using primates in toxicology studies and for the testing of cosmetics, to any waste of animal life in an area of research he hopes will grow extinct as more and more tissue cultures can be substituted for live animals.

He himself, as a medical doctor in research, had made some important contributions in discovering that not only the red cells but the blood serums and white cells contain antigens that create immune responses in mice, monkeys and men.

Together with Alexander Wiener, the discoverer of the Rh factor, Jan's exploration of blood groupings in primates helped pave the way for the first successful test of a vaccine for Hepatitis B, conducted at his laboratory.

His work would continue to be in the area of blood diseases, where non-human primates, even when they are infected with AIDS or hepatitis, do not develop symptoms or die. So it is mostly the enforced isolation and distortion of their natural life that creates the hard choices for scientists.

But this was not all to Jan Moor-Jankowski. He had been one of those lesser known of the Polish Resistance rescuing Jews. He was given the French

But this was not all to Jan Moor-Jankowski. He had been one of those lesser known of the Polish Resistance rescuing Jews. He was given the French Government's Cross of Merit for this, as well as for his scientific discoveries.

As the editor of the Journal of Medical Primatology, he had stood up for his right to publish a letter by an animal rights activist, criticizing a multinational pharmaceutical corporation.

His victory in the seven-year Immuno A.G. Corporation libel suit that was leveled against him is considered a landmark in judicial interpretation of First Amendment rights as they apply to letters to the editor, and the case is often cited in libel defense litigation today.

In the weeks to follow I would talk to Suzanne Roy of the California-based In Defense of Animals, and would find out that many in the animal activist community considered him a kingpin in the battle between animal advocates and an often impenetrable medical research front. But right now I would have something far more complicated and confusing to try to unravel. "You will see that I am in the middle of a critical moment. I will explain," Jan said, as I entered his house, taking one of the two portable telephones momentarily away from his ear.

It would take a little while for Jan's side of the story to come, and still it seems as if there must be much more to it.

"The laboratory that I founded and directed for 30 years was taken away from me last August," Jan said when he got off the phone. It was a laboratory run under the administration of New York University, where Jan had enjoyed 30 years on their research staff.

The trouble began, Jan said, with a telephone call from an animal activist group, the California-based In Defense of Animals, accusing Jan's Sterling Forest Laboratory for Experimental Medicine and Surgery in Primates, known as Lemsip, of the deaths of three monkeys after improper surgery.

When Jan realized that the accusations referred to another New York University laboratory, adjacent to his, he began to investigate.

The experiments in question, conducted at the Institute of Environmental Medicine, involved giving monkeys crack, a practice Jan feels is exploitative and cruel to the animals, and even scientifically cannot yield any meaningful results.

Jan told the Department of Agriculture what he knew when their investigators came to him mistakenly because of the complainants' confusion as to where the experiments were taking place. When the medical school's oversight committee asked that the charges be handled internally, Jan said, he resigned because he felt the committee was trying to cover up the charges.

On Aug. 8, 1995, shortly after Jan was elected to the French Academy of Medicine, to take Linus Pauling's place, the Department of Agriculture faxed the president of New York University to say that a whistle blower investigation had begun. The next day, Jan's employment was terminated without notice or written explanation, he says.

What further complicates the case is that Lemsip -- well-liked even by many animal activists for the pains taken for the chimpanzees' quality of life -- is being given away. It will go to Dr. Frederick Coulston, a toxicologist who works a great deal with cosmetics and industrial chemicals, and who, during the libel suit against Moor-Jankowski, supported Immuno.

According to Dan Perkes of the public relations office of New York University's medical school: "In this changing era of medical care, with the decreases in income impacting all medical centers, they had thought it prudent to unload Lemsip. They couldn't afford to keep it. Moor-Jankowski went along with the facility, when the resposibility for running it was turned over to Coulston."

Officially the changeover will not occur until this August. Why then was Jan dismissed a year earlier?

"The Aaron Diamond AIDS Research Center, already affiliated with New York University, had wanted to take it over, and they would have retained me," Jan said. "I also had already formed a group of scientists who were willing and able to take it over."

Jan tells me that because of his whistle-blowing activity he is now deprived of invaluable laboratory notes that he and Alexander Wiener made together, of his own laboratory protocols, unpublished manuscripts and books, as well as the frozen biological reagents accumulated in the course of 30 years.

Recently the Department of Agriculture dismissed the whistle blowing charges as groundless. For New York University this is proof of the insubstantiality of Jan's case. For Jan it is further evidence of the way that power and money -- the industrial complex allegedly behind Dr. Coulston's kind of research -- obstruct academic freedom and justice.

As I sit in Jan's dining room a foot-fall away from the secret room, with only a few loose boards for an entry -- he suspects it had been used in a boat route by the Underground Railway to transport slaves through Orient to Canada -- I think about the complex issues in university-administered research situations, of who owns what in this sort of "over-seeing," especially when grant money is frequently raised by the scientists themselves.

As we move from his quarrels with New York University into issues of animal ethics, my eye rests on the dried bittersweet in the window, and dried leaves no one else would have thought to make beautiful, aglow in the late afternoon sun.

I am immediately upset when he tells me that although he would not use the heart of a chimpanzee for transplant, he would use the heart of a baboon.

This valuing of life according to its closeness to what is human will continue to trouble me as he tells me over a lunch -- that does include meat -- that ever since he was 5 years old, growing up in the town of Czestochowa in Poland, he had known that he would go into medical research.

Three of his uncles were doctors. But when his aunt was dying of cancer and he asked them why they couldn't help, they told him there were things that doctors didn't yet know.

A sadness comes over him when he talks of a childhood filled with music and art that was ruptured so suddenly when the Nazis took over, as he talks of his mother, who had trained as a concert pianist, bringing small chamber groups into their house. His father, an engineer, was the sort of man who used to ball out drivers for beating their horses, he says.

When the Germans invaded Poland, Jan immediately volunteered to fight in the resistance, and was injured trying to defend Warsaw's main railroad station.

The years that followed were ones of repeated injury and periodic interment, as he worked to create escape routes for Jews from the burned-out Warsaw Ghetto at a time when the Polish Underground was reluctant to allow people to hide in its units in the forest. He went from one set of false identity papers to another, even masquerading for a while as a German officer, helped by the knowledge of the language he had acquired in childhood.

"When the war came and nobody knew whether and how long one would survive," he says, "people cast aside formal religious and social taboos. There was a general feeling that if one should die there would be at least a child who would live on."

He became the father of a son he saw once, when the baby was two weeks old. He wasn't to see him again for 35 years.

I listen to the stories of how he eventually escaped to Switzerland, where he was able to pursue his medical studies. He had managed to get his matura or high school equivalency in the schools run secretly by the Underground, after all the official schools were closed.

It was a time when refugees were not well looked upon in Switzerland, and despite his good school record the only work that he could get was in the high mountains, studying the blood groups of the people "who clung to their fields, which were so steep there was no way to use a tractor, but they loved their freedom."

When he was working in Cambridge he began to experiment on himself. He was injecting himself with the red cells of some monkeys that a friend who had finished a behavioral research project had given to him.

Friends discovered this and told him that if he submitted a request to an appropriate agency in the United States, he would be given a group of prisoners to work with. He spent a sleepless night thinking about what it meant to be subjected to experimentation involuntarily. It was then that he decided to learn all that he could about monkeys and apes, the closest relatives to human beings.

I struggle with my feelings as I watch the Lemsip video Jan has given me.

I watch a chimpanzee with a toothbrush in one hand and a mirror in the other. I watch baby chimpanzees in diapers and humanized clothing being held lovingly and learning to do human things. I ponder Jan's telling me that it was when he saw this behavior he knew that he couldn't take a chimpanzee heart.

Then the video flashes to the separated cages with bars on all sides, so the animals can see one another at all times.

"It's not that I have a right to do this to you," James Mahoney, the veterinarian who is Lemsip's daily director says, large on the video screen. "Only that I need you. Therefore I owe it to you to make it up to you as best I can."

No matter how costly it is to care for chimpanzees in captivity, Jan feels it is his moral responsibility to provide them with as close as possible to a "normal" life within the isolation that being infected demands.

I think of the words of Suzanne Roy of In Defense of Animals who had said, when I called her: "We disagree on the most basic philosophical issues. But once we have agreed to disagree, we are able to work with each other on common ground."

There is a moment, only, when in the course of a seven-hour visit that Jan grows very tired and has to lie down. I too am very tired, I realize, for interwoven with the current legal situation is the case with Immuno -- the seven years of libel trials, the expenditure of $200,000 and much of his own research time.

In 1983, as the editor of the Journal of Medical Primatology, he had published a letter to the editor written by Dr. Shirley McGreal, the chairwoman of the International Primate Protection League, questioning a plan to do research with chimpanzees in Sierra Leone in a study of hepatitis proposed by Immuno A.G.

McGreal's letter had argued that Immuno's plan violated international accords for the protection of endangered species, while keeping the chimpanzees in Africa instead of importing them for study very cleverly circumvented international trade agreements.

She expressed her concern about the way baby chimpanzees are captured by killing their mothers and about whether the infected animals would be returned to the wild, with no proper plans made for them after their use

McGreal's insurance company, having spent more than $100,000, settled "for her, against her will," Jan says, The uninsured publishers also decided to settle. Jan continued to fight.

The case shuttled two times to the United States Supreme Court and back down, as well to courts in Sierra Leone and Vienna. In June of 1991 Justice Judith Kaye of the New York State Court of Appeals issued the final decision that opinion, as it was expressed in letters to the editor, could not be subjected to silencing.

Interestingly, among the 34 groups that backed Jan in court -- CBS, NBC, The New York Times and Time, as well as many major universities, environmental, civil rights, and animal welfare organizations among them -- there was not one big scientific organization or medical society.

On Nov. 9, 1994, Jan was given the William J. Brennan, Jr. Defense of Freedom Award by the Libel Resource Center.

Jan's eyes are steady, as we return to the issues of academic freedom and his disillusionment, as a European, with the way academic freedom is often taken away in America.

Even as I can feel the pressure of a battle with New York University beginning again, and he tells me of the real pain of his war injuries, ever with him -- why, I ask him, does he emanate such a centeredness and calm?

"It comes from the time I spent living under the Nazis, and the fact that I was lucky in that even though I was occasionally captured, I always had the opportunity to fight back," he says steadily, looking at me.

A closer look

Double trouble in the lab

DNA strand is God's astounding design tool

By SIGMUND BROUWER
Special to the Advocate

Local author Sigmund Brouwer

You need a new liver, the doctor tells you. The doctor pauses looks up from his clipboard, smiles and says: Just be glad this is 2010 AD.

You are indeed glad genetic engineering is so advanced. You are also glad you are rich. You can afford the procedure. The doctor will select a healthy cell from your testicle and fuse it into an immature egg cell from a donor woman. Implanted into a donor womb, the embryo will begin to grow into the baby you once were. Identical eyes. Identical hair. And, of course, identical liver. A liver your body will not reject. After seven months, the doctor will abort the fetus and place its healthy young liver in your aging body.

A far-fetched scenario? Perhaps. Not after 'Dolly', who proved cloning from an adult organism is possible. For that matter, humans have already been cloned at the embryo stage. Yes, it *is* technically feasible today for a couple to conceive, then split off a dozen clones to deep freeze for future use, thus ensuring their newborn child spare parts in his or her adulthood.

In fact, in the brave new world of gene splicing, what was considered science fiction a decade ago is reality now. Consider recent experiments at the University of Basel in Switzerland, where researchers inserted a specific gene into fly larvae regions normally destined to become wings, legs, antennae and other body parts. The fruit flies hatched to display fully formed eyes wherever the gene had been placed — up to 14 eyes per fly bulged from the middle of fly wings, protruded from hairy leg joints, burst from chests, and even dangled crablike at the tips of antennae.

In this brave new world, startlingly new experiments seem to be limited only by grant funds and a scientist's imagination — Dr. Frankenstein's infamous fictional efforts in comparison seem crudely and sadly unambitious.

Experimenting with the raw material furnished by homo sapiens, researchers have successfully transplanted human fetal organs into lab animals, creating "humanized" mice. And through genetic engineering, it is possible to insert changes into the human embryo which would recur in future generations.

Yet, far as scientists have surpassed Dr. Frankenstein in sophistication, there remains the danger of Frankenstein's tragic flaw — a willingness to manipulate life without thought to consequence. For one crucial question is often ignored in the race to expand the frontier of genetic technology: *Are we merely assembled bits of complicated protein strands, or a sum much more than the total of our DNA?*

* * *

Genetics technology is not in itself an evil to be feared. Instead, like most scientific advances, it is a two-edged sword, and promises help for many diseases. In the last year, scientists have discovered specific genes which cause Huntington's disease, Lou Gehrig's disease, and a common type of colon cancer; most recently, scientists located the first breast cancer gene. This is good news — once a disease gene is isolated, scientists can search for ways to cure the disease through gene therapy.

In the short term, genetic screening allows doctors to detect diseases long before the symptoms. Human genes have been spliced into the DNA of bacteria in order to mass produce insulin and other valuable human proteins.

Yet . . .

Less than three years ago, researchers finished a natural progression in experimentation. From simple to complex. Cloning frogs had been possible for decades; cloning cattle long routine for commercial purposes. Next, of course, humans.

At George Washington University, researchers Jerry Hall and Dr. Robert Stillman separated the first two cells of a human embryo. Using a new procedure which replaced a protective outer coating scraped off during the separation process, the two new embryos grew and developed to become identical clones. With 17 microscopic embryos, the scientist produced 48 clones. They were allowed to grow up to six days, then destroyed. Flushed away.

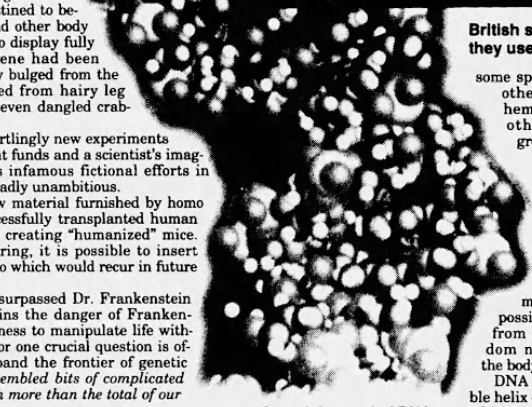
* * *

DNA. *Deoxyribonucleic acid*, life's building block.

When sperm joins egg to become the human embryo at the one-cell stage, the embryo consists of little more than a core of tufts of DNA — and the food to sustain that cell. This single cell must replicate without error to become the trillion cells which make an adult human. As the cell replicates again and again, some specialize to grow hair, others teeth, hormones, hemoglobin, and all the other cells of a full-grown adult. While the cell differentiation depends on which portions of DNA are triggered, each of the trillion cells contain the entire and exact same genetic code of the original cell, making it theoretically possible to clone someone from a cell taken at random nearly anywhere on the body.

Photo by CANADIAN PRESS

British scientists with the flock of sheep they used in the cloning of Dolly



A model strand of DNA

DNA is shaped like a double helix — like a ladder twisted into a spiral staircase. (The DNA ladder in a human cell contains three billion rungs.) Section after section of the ladder forms gene after gene. Each has a specific task. A gene for baldness, for hemoglobin manufacture, for eye color. On and on.

The incredible simplicity of its double helix shape allows the DNA to replicate itself unerringly — like a trillion photocopies, each without a trace of blurring. (As the cell divides, enzymes coax the DNA to progressively unzip itself down its entire length. As it unzips, the displaced DNA is replicated from the pattern of the existing strands, resulting in two new ladders identical to the original.)

Because it replicates itself so faithfully, the coils of the double helix make an essentially unbroken descent from the very first human. The instructions for human life — the history of the species — are preserved in every cell of every human. DNA is an almost immortal thread, winding from generation to generation.

The experimental scientist of the latest generation has the technology to cut and paste and manipulate this at will.

* * *

For part of the background I felt necessary for my novel, Double Helix, I read The Astonishing Hypothesis, by Dr. Francis Crick. He is considered one of the founding fathers of modern genetic science. He and James Watson received a Nobel prize with Maurice Wilkins for their combined discovery of the structure of DNA in the early 1950s.

Forty some years later, Dr. Crick wastes no time attempting to astound the reader with his new hypothesis, a theory outlined in the first sentence of his book, "The Astonishing Hypothesis is that 'You', your joys and your sorrows, your memories and your ambitions, your sense of personal identity and free will, are in fact no more than the behavior of a vast assembly of nerve cells and their associated molecules."

Later, in one of the conclusion chapters, titled Dr. Crick's Sunday Morning Service, he makes his point more clear, declaring, "If the scientific facts are sufficiently striking and well established, and if they support the Astonishing Hypothesis, then it will be possible to argue that the idea that man has a disembodied soul is as unnecessary as the old idea that there was a Life Force. This is a head-on contradiction tot the religious beliefs of billions of human beings alive today."

Dr. Crick, one of the eminent genetic scientists, is telling us the soul does not exist.

Aside from flaws in classical logic in the book (he argues because some Christians disagree with some science, it follows that they are also wrong in other areas of belief), and aside from the arrogance of claiming that his addition to an age-old debate is 'astonishing', Dr. Crick's hypothesis that humans do not have souls is disturbing in light of modern day genetics science.

Are we merely assembled bits of complicated protein strands, or a sum much more than the total of our DNA?

In a scientific world which disallows the existence of a soul or ignores the question, we, then are merely assembled bits of complicated protein. This humanistic approach removes sacredness of life and leads to a very slippery slope, where, for example, last year in the United States, the presidential medical advisory committee recommended the deliberate breeding of 'human tissue' for experimental purposes.

Yet in the scientific world, there are those who do understand we are a sum more than the total of our DNA. As scientists learn more about the intricate workings of the universe, a growing number are finding it scientifically unreasonable to accept that our universe was created and sustained at random, and are tuning to a theory of 'intelligent design'.

Dr. Jeff T. Hutchins, for example, a senior scientist for a company in the famed Research Triangle Park of Raleigh, North Carolina, says, "Every time I see the complexity of protein structure and function, I am reminded of God's hand in every aspect of our world."

As a lay person outside of the scientific world, and with only an elemental understanding of the complexity of DNA, I too, found increased faith through the new knowledge of how I was formed from conception; the incredible process of life and growth at the molecular level pointed me to the marvels of my Creator.

And as I learned more about the molecular process of life, I marvelled too, at the existence of love as a reason to further understand that the human body truly is a God-designed vehicle for a soul. After all, and I had the luxury of allowing my main character to echo this thought, "there is no biological explanation for love. No gland which dispenses it. Where in the fabric of all complex protein would come love if not from an invisible soul, given at conception with the miracle of life?"

Because of the contemplations that arose as I spent time researching Double Helix, I particularly enjoy what Stanton L. Jones offered in a recent Christianity Today review which pointed out flaws of evolutionary psychology theory. Jones says that our growing knowledge of the biological foundations of human life challenges people of faith to understand deeper why God designed us to be biological creatures, and that the challenge is to let the world understand we are not merely biological.

I'd like to offer my thoughts along with Jones'. God designed us with a body to support a mind; a mind to direct a body; and a soul which grows or diminishes according to the choices of the mind and body which nourish it.

If DNA, then, is the astounding tool God uses to mold protein as a way to carry life, DNA should not be used as a tool of convenience for our purposes.

* * *

Scientist have the power to re-engineer the human species.

In 1992 that I read the statement in an article in The Economist. As a novelist, I had the obvious next thought: What if a scientist really did attempt to re-engineer homo sapiens?

I dismissed the thought as ridiculous. Still, I kept mild passing interest in the growing number of articles on genetics I saw elsewhere. When I had a chance a few years later to spend an afternoon at the University of Calgary genetics lab with a scientist, I gladly took it. He invited me to watch through a microscope as he injected a strand of DNA into the one-celled embryo of a worm.

The single cell was round, like a two-dimensional balloon. In the centre was a smaller balloon, the cell nucleus, containing the embryo's DNA. As I watched, a hollow glass needle pushed against the cell wall. The needle burst through the cell wall, and then violated the inner nucleus. A regulated tiny puff of air pushed a foreign strand of DNA through the hollow needle into the embryo's original DNA. The worm would now mutate, enabling the scientist to map a segment of the gene code.

"Hey, this is a simple technical process," I said as I peered in the microscope. "Could you do this to a human embryo?"

"Certainly, but it would be unethical!" the scientist answered, as if all scientists in the genetics world shared his shock at my question. I decided the premise of Double Helix might not be as ridiculous as I had first considered.

Based on what is now technologically feasible in genetic engineering, Red Deer author Sigmund Brouwer's novel Double Helix is about contemporary science out of ethical control, and what can happen when man's lust for immortality breeds the ultimate immorality.

ONE OF AMERICA'S GREAT NEWSPAPERS

50 CENTS | FRIDAY, MAY 30, 1997 | VOL. 70, NO. 303 5/30/97 ● FINAL

Mice given whole human chromosomes

Scientists laud discovery in Japan as key tool in fighting disease, developing research

By Rick Weiss
The Washington Post

For the first time, geneticists have made mice whose cells contain whole, functional human chromosomes along with their own mouse DNA, allowing the mice to make a range of human proteins potentially useful against cancer, autoimmune diseases and infections.

Scientists said they were shocked that such large chunks of human genetic material could be put into mice with no apparent ill effects to the animals, and equally surprised that the large human chromosomes functioned normally in the mice.

"It's stunning," said Howard Petrie, director of the monoclonal antibody core facility at Memorial Sloan-Kettering Cancer Center. "The sheer impact of transferring a piece of DNA that big is amazing. It opens up a whole array of things that can be done."

Petrie said the work, conducted in Japan, suggests that mice or other animals may someday be engineered to mass-produce various therapeutic products, such as human antibodies, that often are not made in sufficiently high quantities to cure diseases in people.

In high enough doses, antibodies can shrink tumors and can interfere with the reactions that cause autoimmune diseases such as rheumatoid arthritis. They also can kill bacteria and viruses.

Other scientists said the chromosome-transplant technique could help them study in mice the key genes involved in human embryo

development. Still others said the method could facilitate research on genes that cause inherited diseases.

The transferred chromosomes hold as many as 1,000 genes each — more than 50 times the amount of genetic material ever before transferred from a human to a mouse.

In the new work, led by Kazuma Tomizuka of the Kirin Brewery Technology Laboratory in Yokohama, researchers moved entire human chromosomes into mouse embryo cells by fusing human skin cells to mouse embryo cells. The researchers kept the embryo cells that captured human chromosomes 14 and 22, which together contain the genes necessary to make human antibodies, and implanted those cells into females.

The resulting newborns made human antibodies when the scientists gave them a shot of a foreign protein, showing that the transplanted genes were working normally, the researchers report in the June issue of Nature Genetics, released yesterday. In theory, a patient infused with a dose of such antibodies would not reject them since they are completely human.

In separate experiments, the Japanese team showed that human chromosome pieces can in some cases be passed on to the offspring of humanized mice — a surprising finding because extra chromosomes typically interfere with reproduction.

Mice normally have 40 chromosomes, but those given human chromosomes 14 and 22 had a total of 42 (with the exception of one case in which one of the mouse chromosomes got mysteriously lost in the process, resulting in 41).

"It's very elegant work," said John Harrington, a geneticist at Case Western Reserve University and a vice president at Cleveland-based Athersis, a biotechnology company that recently made news for its creation of the first artificial human chromosomes. "It suggests that human artificial chromosomes could also be transferred to mice and perhaps to other animals as well."

For example, artificial chromosomes could be designed to carry specific human genes, such as those that help make virus-fighting proteins. A colony of mice endowed with such chromosomes might make vast quantities of the therapeutic proteins in their blood, which could then be purified and given to people suffering from viral infections.

Scientists have made incremental progress over the years getting larger and larger pieces of human DNA into laboratory animals, especially mice.

TEXT from Washington Post : 1997 (May 30) - "HUMAN CHROMOSOMES TRANSPLANTED INTO MICE" by Rick Weiss

https://www.washingtonpost.com/archive/politics/1997/05/30/human-chromosomes-transplanted-into-mice/ffaf20c3-f2b4-4f16-a469-7e32890eca1b/

For the first time, geneticists have made mice whose cells contain whole, functional human chromosomes along with their own mouse DNA, allowing the mice to make a range of human proteins potentially useful against cancer, autoimmune diseases and infections.

Scientists said they were shocked that such large chunks of human genetic material could be put into mice with no apparent ill effects to the animals, and equally surprised that the large human chromosomes functioned normally in the mice.

"It's stunning," said Howard Petrie, director of the monoclonal antibody core facility at Memorial Sloan-Kettering Cancer Center. "The sheer impact of transferring a piece of DNA that big is amazing. It opens up a whole array of things that can be done."

Petrie said the work, conducted in Japan, suggests that mice or other animals may someday be engineered to mass-produce various therapeutic products -- such as human antibodies -- that often are not made in sufficiently high quantities to cure diseases in people. In high enough doses, antibodies can shrink tumors and can interfere with the reactions that cause autoimmune diseases such as rheumatoid arthritis. They can also kill bacteria and viruses.

Other scientists said the chromosome transplant technique could help them study in mice the key genes involved in human embryo development. Still others said the method could facilitate research on genes that cause inherited diseases. The transferred chromosomes hold as many as 1,000 genes each -- more than 50 times the amount of genetic material ever before transferred from a human to a mouse.

"Its very elegant work," said John Harrington, a geneticist at Case Western Reserve University and a vice president at Cleveland-based Athersis, a biotechnology company that recently made news for its creation of the first artificial human chromosomes.

"It suggests that human artificial chromosomes could also be transferred to mice and perhaps to other animals as well," Harrington said. For example, artificial chromosomes could be designed to carry specific human genes, such as those that help make virus-fighting proteins. A colony of mice endowed with such chromosomes might make vast quantities of the therapeutic proteins in their blood, which could then be purified and given to people suffering from viral infections.

Scientists have made incremental progress over the years getting larger and larger pieces of human DNA into laboratory animals, especially mice. The standard technique is to transfer the human DNA into mouse embryo cells, which are then implanted into the wombs of female mice. The resulting newborn mice bear the transferred human genes.

But only a limited amount of DNA can be transferred using standard techniques. Mice given some, but not all, of the genes needed to make human antibodies end up making hybrid antibodies that are part human and part mouse. These hybrids have mostly proved disappointing when injected into sick people, because the mouse portions are recognized as foreign by these patients' immune systems and are destroyed.

In the new work, led by Kazuma Tomizuka of the Kirin Brewery Technology Laboratory in Yokohama, researchers moved entire human chromosomes into mouse embryo cells by fusing human skin cells to mouse embryo cells. The researchers kept the embryo cells that captured human chromosomes 14 and 22, which together contain the genes necessary to make human antibodies, and implanted those cells into female mice.

The resulting newborns produced antibodies made of human components when the scientists gave them a shot of a foreign protein, showing that the transplanted genes were working normally, the researchers report in the June issue of Nature Genetics, released yesterday.

Using a different technique, a company called Cell Genesys in Foster City, Calif., recently made completely human antibodies in mice. Their method allows mice to make only a limited variety of human antibodies, however, and does not transfer the extra chromosomal portions that ensure the antibodies get made only in the spleen and thymus, as the Japanese method does. Those are the organs where antibodies are produced in people -- a detail that may be important to their proper function. In the Japanese experiments, several human genes worked only where they should. For example, genes that normally operate only in liver cells became active only in the liver cells of the mice. That indicates that the complex genetic machinery that regulates when and where a gene should work arrived in working order along with the genes themselves on the transferred human chromosomes.

But Stanford University immunologist Ronald Levy said the Japanese did not "knock out" the mouse's own antibody genes, which Cell Genesys did. That means the Japanese mice may be making both mouse and human antibodies, and the human ones may have to be purified from the mixture before being given to patients.

In separate experiments, the Japanese team showed that human chromosome pieces can in some cases be passed on to the offspring of humanized mice, a surprising finding because extra chromosomes typically interfere with reproduction.

Mice normally have 40 chromosomes, but those given human chromosomes had more. In one case, one of the mouse chromosomes mysteriously got lost in the process. That mouse was born with shrunken testicles because the mouse chromosome that got lost was the male-determining Y chromosome.

Secrets *of a* deadly disease

Scientists are looking at rogue proteins called prions to find out whether humans are at risk of chronic wasting disease.

By Maura Lerner
Star Tribune Staff Writer

CLEVELAND — Tim Hnath, the Fed Ex man, doesn't seem worried as he places the packages on the lab doorstep.

Sure, he knows his cargo could be toxic. How could he forget? The warning signs are everywhere: Biohazard. Caution. No food or drink.

But he's learned how to negotiate his way down this hall. "If you ever see a room like this," Hnath warns a colleague, "*never* walk across the red tape."

Most people don't want to be anywhere near the infectious agent that causes mad cow disease and its family of brain-wasting illnesses. But at the medical school at Case Western Reserve University, they can't get enough of it.

Thanks to Hnath and his daily deliveries, scientists here are amassing the world's largest collection of human tissue infected by prions (*pree-ons*) — the strangely misshapen proteins that are believed to be causing all the trouble.

As a result, they just may hold the key to a mystery that has cast a pall over this year's hunting season — whether humans are in any danger from deer and elk with chronic wasting disease.

DISEASE continues on A10:
— A list of prion diseases.

ASKING THE EXPERTS
Would you eat venison?

Phyllis Scalzo, technician in prion research lab, Case Western Reserve University, Cleveland:

"It's a concern after what we saw happen in England. I loved venison. Because I'm here, it's a

DISEASE from A1

Scientist has created a first-alert system in lab

If the animal disease ever does spread to humans, Dr. Pierluigi Gambetti and his team at Case Western may be the first to spot it.

Gambetti has created, in effect, a first-alert system for hu-

garbage will be steamed for hours in a device called an autoclave before it is incinerated.

Unusual obsession

Gambetti remembers when he would examine such tissue with his bare hands. It was in the early 1960s, when, as a young pathologist, he would stumble on a rare case of CJD. Back then, it was little more than a medical oddity.

But in 1984, a mentor from his old medical school in Bologna, Italy, sent him a curious brain sample. It came from a man who developed incurable

thing of the past."

Richard Danila, deputy state epidemiologist, Minnesota Department of Health, Minneapolis:

"I have, and I would, sure. I wouldn't have a problem in eating it."

Dr. Pierluigi Gambetti, director, National Prion Disease Pathology Surveillance Center, Case Western Reserve University, Cleveland:

"It's not a question I answer . . . If I really had to do it, I would try to go where there's no evidence of chronic wasting disease."

Byron Caughey, prion researcher, National Institutes of Health Rocky Mountain Laboratory, Hamilton, Mont.:

"Sure. If I were given any. I wouldn't eat it if it were from the CWD endemic areas . . . unless I were really hungry and I had no other option. But I don't think the risk is all that great."

Dr. Neena Singh, pathologist and prion researcher, Case Western Reserve University:

"I am worried now of eating beef. I try to avoid it if I can."

Dr. William Hueston, former mad cow disease investigator, professor of veterinary medicine, University of Minnesota, St. Paul:

"I'd have no problem myself. I love it."

"Everything that leaves here is incinerated — except us."

— A lab technician

man prion disease in labs where the words "be careful" take on a whole new meaning. Once inside these labs, explains one of Gambetti's technicians, "everything that leaves here is incinerated — except us."

Prion immersion

Gambetti, an Italian-born expert in brain disorders, has immersed himself for 18 years in prion diseases. So he has his own theory about the one in the news now: chronic wasting disease (CWD), which turned up in scattered deer and elk herds across the country (so far in Minnesota, in a single elk).

Like most scientists, he thinks it's unlikely to infect people. But the evidence that humans are safe from CWD is circumstantial, and no one is offering iron-clad guarantees, especially in the wake of Britain's mad cow debacle, where the experts turned out to be wrong.

So he and other scientists are trying to find out what makes prions dangerous. "In other words, we want to know the enemy," he says.

Long before mad cow and chronic wasting got their ghoulish names, these types of diseases roamed the earth in relative obscurity. In people, they would occur randomly at the rate of about one in a million; and in some unlucky families, prion diseases run in the bloodline. Invariably, these illnesses are gruesome and fatal, causing rapid dementia and death.

It was only in 1996, when British health officials noticed an unusual increase in people with one such illness — Creutzfeldt-Jakob disease (CJD) — that they realized they had an entirely new problem on their hands. Some people, they concluded, were getting sick from eating tainted beef.

Shortly after, Gambetti won a federal grant to set up the National Prion Disease Pathology Surveillance Center on the shores of Lake Erie. Now, he's asking doctors from all over the United States to send him samples of suspected CJD cases, on a strictly voluntary basis. This way, he hopes to be able to spot any suspicious trends — as well as study the rogue proteins that seem to be wreaking havoc in both animals and humans.

Lots of gloves

Phyllis Scalzo, a lab technician, figures she may have seen the deadly CJD infection once in 17 years before she went to work for Gambetti. Now, it's all around her. It's in the freezers lining the hall, and in a half-dozen metal cabinets where brain tissue is preserved in white buckets. It's on the slides she prepares for testing. It's on the equipment.

And it's in the packages that greet her each morning. Or so she must assume.

"I'm going to be going through a lot of gloves," she explains.

The danger is unspoken, and in many ways unknown. There's no known case of anyone getting sick from handling the diseased tissue. But then again, she's dealing with something that seems to defy the laws of science.

The prion is a protein that somehow gets twisted into a deadly form. Once it does, it's nearly indestructible. It can withstand temperatures of 1,100 degrees Fahrenheit, and disinfectants are useless against it.

It's the only known infectious agent that has no DNA or genetic material of its own — yet it can reproduce, in a sense. It apparently triggers a chain reaction in other proteins, turning normal ones astray. Eventually, they destroy cells in the brain, leaving it looking like a sponge, pocked with holes.

The whole thing once seemed so preposterous that Dr. Stanley Prusiner, the scientist who discovered and named prions, was ridiculed at first. In 1997, however, he won the Nobel Prize in medicine for his discovery.

The worst part is that the diseases have been uniformly fatal. No exceptions.

So Scalzo and her colleagues take no chances.

Photographs by Joey McLeister/Star Tribune

Lab technician Phyllis Scalzo was well-covered as she worked with potentially infected tissue.

Prion diseases

Prion diseases, also known as transmissible spongiform encephalopathies (TSEs), are thought to be caused by misfolded proteins. TSEs occur in different forms in humans and animals. The fatal diseases cause sponge-like holes in the infected brains and can take years to develop.

Known human prion diseases	Explanation	Discovered
Creutzfeldt-Jakob disease (CJD)	Named after the discoverers. Kills about 250 Americans a year. Strikes at an average age of 65 and results in rapidly progressing dementia. Arises spontaneously or is inherited, but it can be transmitted by tainted surgical tools, transplants and a growth hormone.	1920s
Inherited TSEs	Gerstmann-Straussler-Scheinker disease (GSS), the first hereditary TSE to be discovered, and fatal familial insomnia are extremely rare, found in just a few families.	1936 (GSS) 1986 (FFI)
Kuru	Occurred among New Guinea tribe members whose ritual handling or eating of dead people's brains probably spread the disease. The ritual was halted.	1957
Variant Creutzfeldt-Jakob disease (vCJD)	About 135 cases in England and Europe linked to eating beef products contaminated with mad cow disease. A U.S. woman raised in England also has been diagnosed. It strikes at an average age of 27, causing anxiety, depression or other neurological disorders before death.	1996

Prion diseases in animals	Host	Explanation	Discovered
Scrapie	Sheep, goats	Has long infected sheep,but there is no evidence that it is transmitted to humans by eating mutton or lamb. Scrapie-contaminated animal feed may have caused prion disease in cattle.	1700s
Transmissible mink encephalopathy	Mink	Reported in Minnesota and Wisconsin, most recently on a ranch in Stetsonville, Wis., in 1985. Contaminated feed may have been the source.	1947
Chronic wasting disease	Deer, elk	First found in Colorado captive mule deer. Now detected in elk or deer in nine states. Found in Wisconsin wild deer and in one farmed elk in Minnesota.	1967
Mad cow disease or bovine spongiform encephalopathy (BSE))	Cattle	Outbreak in England led to mass destruction of cattle in the 1990s. Can be spread to humans by eating contaminated meat products.	1986
Feline spongiform encephalopathy	Cats	First reported in England, thought to be caused by exposure to food contaminated with BSE.	1989

Star Tribune

Federal Express courier Tim Hnath arrived at the Case Western Reserve University medical school. He said he treats the packages, containing possibly toxic tissue, "with kid gloves."

Before she opens the mail, she slips on a disposable lab coat, apron, booties and a splatter guard to cover her face. She'll add two more sets of gloves before she moves the tissue samples — which arrive in special styrofoam coolers, packed in dry ice or preservative — to the biohazard table for closer inspection.

She rips gloves on and off obsessively. No pair is worn for more than a few minutes. She doesn't want to contaminate anything accidentally. "That's the most important thing: Know where your hands are at all times," she says. Your feet, too. Nobody wears the same shoes home.

Gambetti's team is about to open an even more secure lab where everyone will be covered head to toe at all times, and the insomnia, went mad and died. Gambetti, an expert in Alzheimer's disease, started looking for answers in the patient's brain tissue. Then a second member of the family died in similar fashion; and a second sample was sent to Gambetti. Ultimately, he discovered it was a type of prion disease that ran in the unfortunate family. He named it fatal familial insomnia.

Thus began his obsession with collecting human prion diseases. It was, he figured, the only way to see enough of these rare cases to study them properly.

Prion diseases have long been a mystery.

The earliest known form is scrapie, found in sheep more than 200 years ago. The story goes that it got its name when infected sheep would start acting erratically and scrape themselves endlessly against trees, as if scratching an itch.

In the 1950s, a human disease called kuru turned up in a tribe of cannibals in New Guinea, after women and children ate the brains of relatives in a funeral ritual. They called it "the laughing death."

Mad cow disease appeared suddenly in English cattle in the 1980s, and it spread in epidemic proportions through animal herds. It's believed that the disease started when cows ate feed that contained ground-up, scrapie-infested sheep.

Experts hastened to assure the British people that they had no reason to worry — after all, people had been eating scrapie-infested sheep for hundreds of years and were none the worse for it. In an infamous publicity stunt, the agriculture minister, John Gummer, and his 4-year-old daughter chomped on burgers for the cameras in 1990. Six years later, the first human cases were tied to tainted beef.

So far, about 135 people have come down with the disease in England and several European countries. Its victims plunge into depression and dementia at an average age of 27, and die in about a year. The illness is distinct enough that doctors call it "variant CJD." Given the millions of people who ate beef, it's still exceptionally rare. Yet even though the animal epidemic has been stopped — by mass destruction of Britain's cattle — no one knows how many more human cases are incubating.

In more than 250 reported cases worldwide, doctors have inadvertently spread CJD from patient to patient through tainted surgical equipment, transplant tissue and human growth hormone. Health officials have warned brain surgeons and others to take extra precautions, but there is no widely available test to check equipment or tissue for prions.

The sobering experience in Britain prompted health officials in the United States to take a fresh look at chronic wasting disease, which first surfaced in Colorado deer 35 years ago. So far, animals in nine states and two Canadian provinces have tested positive, including wild deer in southwestern Wisconsin and a single captive elk in Minnesota. Yet CWD hasn't been linked to a single case of human illness.

Assessing risk

Dr. William Hueston, a University of Minnesota veterinarian, knows what a mad cow outbreak looks like. And this doesn't look like one to him.

As a scientist with the U.S. Department of Agriculture, he helped investigate the outbreak in England in the late 1980s and early 1990s.

By comparison, the threat of chronic wasting disease doesn't keep him up at night. "We put all [the] evidence together, and what it says is that there's no evidence that this is a disease that rapidly spreads

DISEASE continues on next page

DISEASE from A10

Mad cow situation was much different

to humans," he says.

Why not?

First, the differences. In England, he says, "there were tens of millions of people exposed" to tainted beef products; here, eating venison and elk meat is far less common. In England, people ate the most infected areas of sick cows, such as the brain and spinal cord. As the old joke goes, he says, they "used everything but the moo." U.S. hunters are being advised to take the prime cuts of venison — where prions are not thought to accumulate — and leave the rest behind.

Second, there's no sign that people get sick at higher rates if they hunt or live in areas where chronic wasting disease has been found for decades.

Government investigators have checked out about a dozen cases of CJD in hunters — including two men who shared a cabin in Wisconsin (Gambetti's lab ruled out a third suspected case). So far, no link to venison has been found.

"There are two errors we can make," Hueston says. "One is to say something's safe when it's not. The other is to say something's dangerous when it's not."

A species barrier?

Is there, as Hueston and others believe, a species barrier protecting us?

The answer may well be yes and no.

For obvious reasons, no one's going to expose someone intentionally to find out.

But Byron Caughey, a scientist at the National Institutes of Health's Rocky Mountain lab in Hamilton, Mont., tried to approximate those conditions in a test tube. He and his colleagues took prions from deer and elk with chronic wasting disease and exposed them to normal human proteins.

No one's sure how they work, but prions somehow "convert" ordinary proteins and cause them to fold abnormally. Caughey and his colleagues wanted to see whether deer prions did that to human proteins in test tubes.

They found that some of the human proteins converted to an "apparently toxic" state — but not many. It was, Caughey says, only about 1/10th to 1/20th the rate they see in deer-to-deer transmission. "It was barely detectable," he says.

To scientists, it was good news, suggesting a "molecular incompatibility" between the species. But skeptics saw it as proof of danger, and one mad cow Web site even posted the story with the headline: "Chronic Wasting Disease transmits to humans."

Says Caughey: "We got a borderline result. As such, people interpret it however they wish, I'm afraid."

To him, it's a mixed message. "We have to acknowledge that there is some risk of CWD going into humans. But it's likely to be relatively low."

Detecting unknowns

If it does transmit to humans, how will anyone know it when they see it?

"Very difficult, at this point, because you ask me to recognize an unknown," says Gambetti. But if it's anything like the mad cow experience, he says, a human form of CWD might look different under the microscope, and possibly act differently, than other human prion illnesses.

Those, he says, are the "kind of indirect clues" that they watch for. "So we will be ready to recognize these cases, even if we don't know what it's going to look like."

In the meantime, his lab and others are hoping animal studies will shed more light. In Gambetti's lab, a genetic specialist, Dr. Qingzhong Kong, has bred what he calls "humanized" lab mice that have human, rather than mouse, proteins. Researchers want to know whether these mice can acquire CWD.

But even those tests won't be the final word.

They may not know for sure unless they actually find a human case of chronic wasting disease. And that's where Gambetti's center, which reports to the U.S. Centers for Disease Control and Prevention, comes in.

If that day comes, he'll notify federal health officials "and then shut the door and run," he says with a laugh. "I'm the arm, but not the mouth, in this operation."

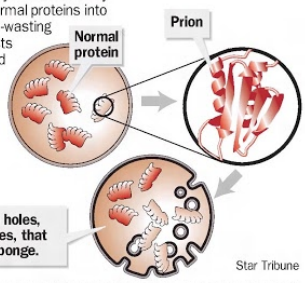
But he doesn't shy away from the possibility. "My loyalty is to the truth," he says. "The important thing is to be as well prepared as possible."

— Maura Lerner is at mlerner@startribune.com.

What is a prion?

Researchers believe that an abnormally shaped protein, called a prion, causes rare, fatal diseases known as transmissible spongiform encephalopathies (TSEs) in humans and animals.

Prions are chemically the same as normal proteins. But they wreak havoc by transforming normal proteins into misfolded, brain-wasting agents. Scientists don't understand all of the steps. As brain cells are destroyed, the result is neurological damage and death.



Star Tribune

Sources: Minnesota Department of Natural Resources; Minnesota Board of Animal Health and Dr. Beth Williams, veterinarian at University of Wyoming

Dr. Pierluigi Gambetti, an expert in brain disorders, has been studying prions and their effects on humans for 18 years. "We want to know the enemy," he said.

Creutzfeldt-Jakob disease deaths in Minnesota

Creutzfeldt-Jakob disease is a rare, fatal brain disorder believed to be caused by misfolded proteins called prions. Experts say the disease is not always correctly diagnosed and may be reported incorrectly on death certificates.

MEDICINE

The eradication of Alzheimer's seemed near, then the vaccine started to destroy the subjects

The dangers of the cure

By Brad Evenson

Few people outside the Alzheimer's world know it, but in the autumn of 2001, the debilitating brain disease was on the brink of becoming a medical relic, like polio or the Black Death. Even veteran brain researchers were giddy about the potential of a vaccine called AN-1792.

"Get the Champagne ready," quipped a prominent Canadian expert.

The vaccine, made by Elan Pharmaceuticals, was considered a breakthrough in 1999 when it cleared Alzheimer's plaques from the brains of humanized mice. Its inventor, Dale Schenk, had won the highest prize given to neurologists, the Potamkin Prize, often seen as a precursor to the Nobel. AN-1792 was unlike the current crop of Alzheimer's pills, which improve symptoms of memory loss for a few months or years. It worked by triggering the immune system, just like the polio vaccine. It ate the problem alive.

Early safety tests found the vaccine safe in humans. So in late 2001, doctors in the United States and Europe injected 360 patients with the first of four planned inoculations. Then the unthinkable happened. Within two months, 15 patients developed inflammation of the brain and spinal cord. No one could say why. The trial was halted after two injections. The Champagne — and AN-1792 — were quietly shelved.

"We never saw a hint of this," said Ivan Lieberburg, head of research at Elan Pharmaceuticals. "It came as a total shock to Elan."

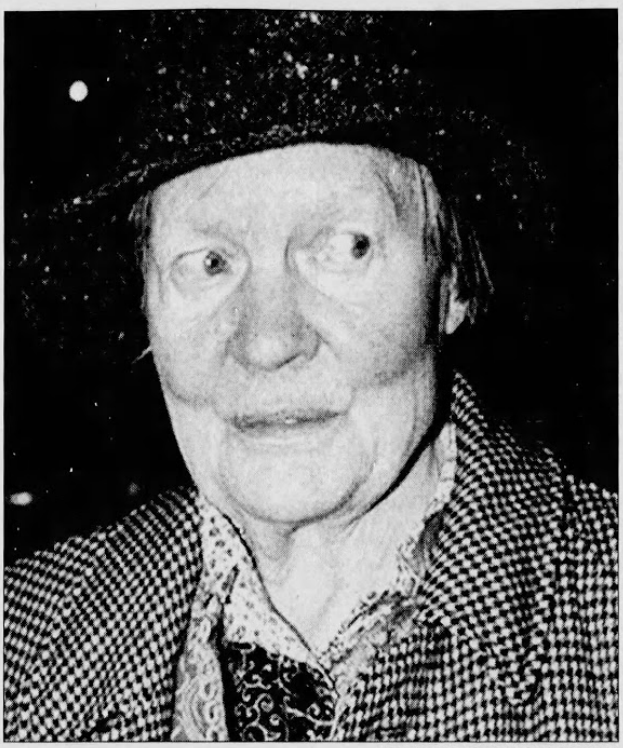
Now, a team of U.S. and German scientists has discovered the nature of the problem. Up to 80% of Alzheimer's patients have some weakening in the blood vessels in their brains. Not only could the vaccine cause inflammation, in experimental mice it caused bleeding in the brain. Although no patients treated with AN-1792 died, it is clear they could have. The study showing what went wrong is published today in the journal *Science*.

In retrospect, researchers say AN-1792 was rushed into human trials too quickly.

"The spectacular success in the mice, combined with the absolute desperation of nothing else out there — other than symptomatic treatments — I'm sure that had something to do with it," says Dr. Peter St. George-Hyslop, a professor of medicine at the University of Toronto and a world leading authority on Alzheimer's disease.

So Alzheimer's is not yet a relic. But as researchers pick up the broken pieces of AN-1792, they believe a cure may be closer than we think.

Nearly a century has passed since an emotional, disoriented 51-year-old woman, known to the world as Auguste D. came to visit physician Alois Alzheimer at his Munich clinic. She could not recall her own name, but she understood her plight. "I have lost myself," she told Alzheimer.



PETER J. JORDAN / THE ASSOCIATED PRESS

Author Iris Murdoch was one of the most celebrated Alzheimer's victims.

It was only after her death several years later that Alzheimer, then head of the anatomical laboratory at the Royal Psychiatric Hospital in Munich, glimpsed the wreckage in her brain under his microscope.

"At a magnification of several hundred times, he finally saw her disease," writes author David Shenk, in his new book *The Forgetting: Alzheimer's, Portrait of an Epidemic*.

It looked like measles of the brain

"It looked like measles, or chicken pox, of the brain. The cortex was speckled with crusty clumps ... too many to count. They varied in size, shape and texture and seemed to be a hodgepodge of granules and short, crooked threads, as if they were sticky magnets for microscopic trash."

Many of the neurons were also tangled like tiny ropes.

These are the infamous plaques and tangles of Alzheimer's disease, the two physical signs that — along with dementia — must be present for a clear diagnosis. Scientists have debated the root cause of the disease for decades, but in recent years many have narrowed their view to the amyloid peptides — bits of protein that accumulate in the brain to become plaques.

"I believe that the amyloid peptide comes first, provoking an injury mechanism in the neuron and then we get the neurofibrillary tangles," says Joanne McLaurin, a professor of pathobiology at the Centre for Research in Neurodegenerative Diseases at the University of Toronto.

"No one knows. But if you could limit the amount of peptide that was there, it would reduce the injury damage."

For some reason, the specialized immune cells in the brain, called microglial cells, do not recognize the build-up of plaques as harmful and destroy them. So Dale Schenk got a simple idea. Why not vaccinate patients against beta-amyloid, the principal component of the plaques?

The idea seems paradoxical. The main protein in Alzheimer's plaques is called amyloid beta, which is present throughout the human body. However, Schenk thought if a peptide — a small bit — of the amyloid beta protein was introduced by an inoculation, vast numbers of antibodies against it would be produced in the bloodstream. If enough of these antibodies got into the brain, maybe they would wake up the microglial cells.

When tested in humanized mice, a vaccine made of amyloid beta peptide worked like magic. It prevented the growth of amyloid plaques in their brains and cleared out the ones that had formed. The scientific world was astonished at the simplicity of the idea.

"I wouldn't have imagined it could ever work," said Sangram Sisodia, chair of neurobiology at the University of Chicago.

But the source of AN-1792's strength is also its fatal flaw. When the the immune system reacts to foreign invaders, it dispatches a fleet of lethal cells and toxic chemicals, which can cause inflammation. Making matters worse, no two people have precisely the same immune response. In an area as delicate as an Alzheimer's patient's brain, this could lead to unpredictable results, such as bleeding. Some patients could die.

Instead of abandoning the vaccine altogether, a group of Canadian scientists has isolated the best aspects of AN-1792, while discarding the parts that cause the immune system to create inflammation.

"We wanted to find out how the antibodies were working — what they were actually doing in the brain," McLaurin says.

The University of Toronto team found the smallest, purest bit of the beta amyloid peptide that would stimulate the creation of antibodies without causing inflammation or bleeding in humanized mice. Their findings were published last month in the journal *Nature Medicine*.

However, the Toronto team is not interested in making a modified vaccine. One lesson of AN-1792 is that immunological responses vary too much from person to person for an Alzheimer's vaccine to be truly safe. "Some people will develop a good immune response and a high amount of antibody while other people will develop a low amount of antibody," explains McLaurin, lead author of the study.

Instead, the Toronto researchers made a "molecular mimic" of the anti-Alzheimer's antibody.

"It's called molecular design," explains St. George-Hyslop. "Basically, the idea is that you take an enzyme or a receptor, discern its three-dimensional shape ... and then you make a drug that will exactly mimic that shape."

This molecular mimic could be made into a pill, he says. This would allow doctors to ensure patients got a reliable dosage, further reducing the chance of inflammation or bleeding. But such a pill would only help stop Alzheimer's in its early stages, before plaques and tangles have destroyed brain cells.

"The problem is that with Alzheimer's disease, once your neurons have died, you can't get them back," McLaurin says.

Deer illness answers still years away for exposed people

By JOHN FAUBER
Knight-Ridder Newspapers

MILWAUKEE, Wis. — In a California laboratory, "humanized" brains of more than 100 mice that were injected with chronic wasting disease lie frozen, waiting for the second part of an experiment that could help answer a burning question.

Can people get sick by eating deer infected with chronic wasting disease?

With the start of the second deer-hunting season since chronic wasting disease was discovered in Wisconsin, the jury is still out.

"We probably are exactly in the same position we were a year ago," said G. Richard Olds, professor and chairman of medicine at the Medical College of Wisconsin.

A series of obstacles could cause that quest to go on for years, or even decades, researchers said.

"This will be an open issue for at least a decade," said Olds, an infectious disease expert. "In fact, if it is less than that, it will be really bad news."

As the result of an extensive testing program based on last year's hunt, hunters at least know that the disease appears to be restricted to the so-called eradication zone centered near Mount Horeb in the southwestern part of Wisconsin, and a smaller area in southern Rock County, as well as a few game farms.

At the moment, scientists don't know how deer get the disease, let alone whether people can.

For years, the study of so-called transmissible spongiform encephalopathies, or TSEs, had been a somewhat obscure branch of science that straddled the fields of veterinary and human medicine.

TSE diseases range from chronic wasting disease in deer to Creutzfeldt-Jakob disease, a rare, incurable neurological disorder, in people.

Both diseases, as well as all other TSEs, are believed to be caused by an unusual infectious agent known as a prion, a type of rogue protein that has no genetic material and is very difficult to destroy. The rogue prions attack normal prion proteins in the human brain.

Research into TSEs accelerated after the mad cow outbreak in Great Britain in the 1980s. Initially, British government officials offered assurances that people were not susceptible to the disease, only to discover later that humans could get a version of mad cow disease, called variant Creutzfeldt-Jakob disease.

At last count, 143 people have died of variant Creutzfeldt-Jakob in Great Britain and an additional 10 outside the country.

In February, the Royal Society, Britain's academy of scientists, estimated the number of new cases by 2080 — the disease has a long incubation period — could vary from as few as 10 cases to 7,000.

In the United States, a new sense of urgency was brought to TSE research after chronic wasting disease was found in Wisconsin, the first time it was seen in wild deer east of the Mississippi River.

Since that discovery in February 2002, there has been little new scientific research on the risk facing people.

Researchers and public health officials have only a couple of tools for unraveling that issue, and both could take years to provide real answers.

Since experiments can't be done on people, researchers have turned to genetically engineered mice.

These mice have been engineered so their brain cells produce the same prion protein that people do. This protein is a complex chain of amino acids that is found in nearly all mammals.

Scientists aren't sure what the actual function of prion protein is, but it is the protein that is attacked by prions, which are chemically identical but have a different shape.

It is believed that prions cause normal prion proteins to become misshapen, resulting in clumps of protein forming in the brain and the death of brain cells.

There are no cures for prion diseases.

Scientists can inject brain tissue from infected deer into the brains of humanized mice and watch for neurological symptoms. Since laboratory mice live about two years, such experiments can be time-consuming.

But even if the mice don't develop symptoms, it still would not answer the question of whether humans are at risk, because prion infections can incubate in people for years or decades before producing symptoms.

At least a couple of research groups, including scientists at the University of Wisconsin-Madison, say they are planning to do such experiments.

About three years ago, Patrick Bosque, now an assistant professor of neurology at the University of Colorado Denver Health Hospital, started such an experiment.

However, there were technical problems and the experiment was never completed, Bosque said.

The brains of the mice remain frozen at his former lab at the University of California, San Francisco.

To complete the experiment, brain tissue from the animals needs to tested for the presence of prions, a process that could be time-consuming and expensive, he said.

"It's something we should do," he said. "It's just a matter of coordinating it. Either way, negative or positive, it's at best a crude measure of human risk."

Bosque said it could take years to prove whether people are at risk.

Until then, he said, it's reasonable to assume that if enough people are exposed to the disease that, over time, at least a small number will get sick.

"It is clear more needs to be known about the risk of transmission of CWD to humans," Bosque said. "Statements to the effect, 'There is no evidence that CWD can be transmitted to humans,' are deceptive."

Bosque's experiment was started in the UCSF lab of Stanley Prusiner, the scientist who coined the term prion more than 20 years ago and later won a Nobel Prize for his research.

Giuseppe Legname, senior scientist at the UCSF lab, said that one of the problems with mice is their short life span.

To find out whether "humanized mice" are susceptible to chronic wasting disease, researchers might have to take brain tissue samples from the exposed mice and inject them into subsequent groups of humanized mice.

By doing these so-called passages, researchers can sometimes shorten the incubation period, he said.

"It takes a long time and you have to spend money," he said.

In the meantime, he said, it's reasonable to assume that chronic wasting disease can be as infectious to humans as mad cow disease.

Test tube research by scientists at the National Institutes of Health in 2000 showed that while there is a so-called species barrier between deer and people, chronic wasting disease prions were able to convert normal human prion protein to the abnormal, diseased form. And they did so at about the same rate as mad cow disease.

At the same time lab experiments are being planned in humanized mice, public health officials are increasing their surveillance of unusual neurological disease in people to look for any clusters or individual deaths in deer hunters or people who ate venison.

"You still need to find that human case," said Ermias Belay, a medical epidemiologist in the Creutzfeldt-Jakob surveillance program at the U.S. Centers for Disease Control and Prevention in Atlanta.

But that could take many years, he said. Such cases might show up as Creutzfeldt-Jakob disease, a disorder that is believed to occur in one in 1 million people per year.

"You will need millions and millions of people to be exposed before you see the human cases," he said.

The Wisconsin Division of Public Health began such a tracking program earlier this year.

Neurologists and other hospital personnel around the state have been asked to voluntarily report unusual dementia cases, said Jim Kazmierczak, state public health veterinarian.

Such cases include dementias in people younger than 55 or rapidly progressing dementias accompanied by other symptoms.

When those patients die, an autopsy will be requested of the family. They also will be asked about various risk factors such as wild game consumption, a family history of Creutzfeldt-Jakob disease and whether the person ever lived in Great Britain.

The state is also considering creating a registry of people who may have consumed venison from deer that later test positive for chronic wasting disease. Such a list could then be matched against any future deaths from unusual dementias, Kazmierczak said.

Austin American-Statesman ❖ Thursday, January 8, 2004 A13

Dr. Michael Greger EXPERT ON MAD COW DISEASE

Human 'mad cow' disease might not be so rare

In October 2001, 34-year-old Washington State native Peter Putnam started losing his mind. One month he was delivering a keynote business address, the next he couldn't form a complete sentence. Once athletic, soon he couldn't walk. Then he couldn't eat. After a brain biopsy showed it was Creutzfeldt-Jakob disease (CJD), his doctor could no longer offer any hope.

Putnam's death a year later may have been caused by mad cow disease.

Seven years earlier and 5,000 miles away, dozens of British young people were dying from what Britain's Secretary of Health called the worst form of death imaginable, a variant of Creutzfeldt-Jakob disease thought to have been caused by mad-cow infected meat they had eaten years before.

The classic form of CJD had been known for decades prior to the discovery of mad-cow disease, though. Hundreds of American families are stricken with cases of this sporadic form of Creutzfeldt-Jakob disease every year, but the beef industry is quick to point out these are cases of sporadic CJD, not the variant known to be caused by mad cow. The cause of these sporadic cases is not known. New research, though, suggests that thousands of Americans die of CJD every year, and that some sporadic deaths may be caused by eating infected meat after all.

Researchers at the University College of London injected mad cow brains into strains of transgenic mice that were genetically engineered with human genes in their brains. As expected, the "humanized" mice died with what looked like the human form of mad cow disease, variant CJD. When they tried this in a different strain of transgenic "humanized" mice, those mice got sick, too, but most got sick from what looked exactly like sporadic CJD. Their conclusion was that mad cow disease might be responsible for some cases of sporadic CJD as well as variant CJD.

No one knows how many people are dying of CJD in this country, in part because it is frequently misdiagnosed. The most common misdiagnosis among the elderly is Alzheimer's disease. Neither CJD nor Alzheimer's can be conclusively diagnosed without a brain sample, and the symptoms and pathology of both diseases overlap.

Over the past 20 years, the rate of Alzheimer's disease in the United States has skyrocketed. Alzheimer's is now the eighth-leading cause of death in the United States, affecting an estimated 4 million Americans. Twenty percent or more of people clinically diagnosed with Alzheimer's disease, though, are found at autopsy not to have had Alzheimer's at all. A number of autopsy studies done at Yale and elsewhere have shown that a few percent of Alzheimer's deaths may be CJD.

Given the new research showing that infected beef may be responsible for some sporadic CJD, thousands of Americans may already be dying because of mad cow disease every year.

The incubation period for human spongiform encephalopathies such as CJD can be decades. It can be years between eating infected meat and getting diagnosed with the death sentence of CJD. Although only about 150 people have been diagnosed with variant CJD worldwide so far, it will be many years before the final death toll is known.

The United States should immediately begin testing all cows destined for human consumption (as is done in Japan), stop feeding slaughterhouse waste to all farm animals and immediately enact a national surveillance program for CJD.

Five years ago this week, the Center for Food Safety, the Humane Farming Association, the Center for Media & Democracy, and 10 families of CJD victims petitioned the Food and Drug Administration and the Centers for Disease Control and Prevention to immediately enact a national CJD monitoring system. The petition was denied.

Currently, it's up to each state to determine how — or whether — they will track CJD. Given the presence of mad cow disease in the United States, the CDC should immediately require mandatory reporting of the disease in all 50 states. In Britain, even feline spongiform encephalopathy, the cat version of the disease, is an officially notifiable illness.

The animal agriculture industries continue to risk public safety, and the government seems to protect its narrow business interests more than it protects its citizens. Internal U.S. Department of Agriculture documents retrieved through the Freedom of Information Act show that our government did indeed consider a number of precautionary measures as far back as 1991 to protect the American public from mad cow disease. According to one such document, however, the USDA explained that the "disadvantage" of these measures was that "the cost to the livestock and rendering industries would be substantial."

After a similar conflict of interest unfolded in Britain, its entire Ministry of Agriculture was dissolved and an independent Food Safety Agency was created, whose sole responsibility is to protect the public's health. Until we learn from Britain's lesson, and until the USDA stops treating this as a public relations problem to be managed instead of a serious global threat, millions of Americans will remain at risk.

Greger is chief bovine spongiform encephalopathy investigator for Farm Sanctuary and the mad cow coordinator for the Organic Consumers Association.

Mice get touch of humanity

By PAUL ELIAS
THE ASSOCIATED PRESS

Stem cell injections help study disease

SAN FRANCISCO – Add another creation to the strange scientific menagerie where animal species are being mixed together in ever more exotic combinations.

Scientists announced Monday that they had created mice with small amounts of human brain cells in an effort to make realistic models of neurological disorders such as Parkinson's disease.

Led by Fred Gage of the Salk Institute in San Diego, the researchers created the mice by injecting about 100,000 human embryonic stem cells per mouse into the brains of 14-day-old rodent embryos.

Those mice were each born with about 0.1 percent of human cells in each of their heads, a trace amount that doesn't remotely come close to "humanizing" the rodents.

"This illustrates that injecting human stem cells into mouse brains doesn't restructure the brain," Gage said.

Still, the work adds to the growing ethical concerns of mixing human and animal cells when it comes to stem cell and cloning research. After all, mice are 97.5 percent genetically identical to humans.

"The worry is if you humanize them too much you cross certain boundaries," said David Magnus, director of the Stanford Medical Center for Biomedical Ethics. "But I don't think this research comes even close to that."

Researchers are nevertheless beginning to bump up against what bioethicists call the "yuck factor."

Three top cloning researchers, for instance, have applied for a patent that contemplates fusing a

See **MICE** Page **A-15**

Fast facts

- Researchers placed human embryonic stem cells into laboratory mice.
- The cells, about 100,000 each, were injected into the brains of 14-day-old rodent embryos.
- Each mouse was born with 0.1 percent human cells in its head, but scientists say the animals were not "humanized."
- Mice are 97.5 percent genetically identical to humans.

Mice: Given human cells

From Page **A-1**

complete set of human DNA into animal eggs to manufacturer human embryonic stem cells.

One of the patent applicants, Jose Cibelli, first attempted such an experiment in 1998 when he fused cells from his cheek into cow eggs.

"The idea is to hijack the machinery of the egg," said Cibelli, whose current work at Michigan State University does not involve human material because that would violate state law.

Researchers argue that co-mingling human and animal tissue is vital to ensuring that experimental drugs and new tissue replacement therapies are safe for people.

Others have performed similar experiments with rabbit and chicken eggs, while University of California-Irvine researchers have reported making paralyzed rodents walk after injecting them with human nerve cells.

Doctors have transplanted pig valves into human hearts for years, and scientists have injected human cells into lab animals for even longer. But the brain poses an additional level of concern because some envision nightmarish scenarios in which a human mind might be trapped in an animal head.

"Human diseases, such as Parkinson's disease, might be amenable to stem cell therapy, and it is conceivable, although unlikely, that an animal's cognitive abilities could also be affected by such therapy," said a report issued in April by the influential National Academies of Science, which sought to draw some ethical research boundaries.

The report recommended that such work be allowed, but with strict ethical guidelines established.

"Protocols should be reviewed to ensure that they take into account those sorts of possibilities and that they include ethically sensitive plans to manage them if they arise," the report concluded.

GAGE

At the same time, the report did endorse research that co-mingles human and animal tissue as vital to ensuring that experimental drugs and new tissue replacement therapies are safe for people.

Gage said the work published Monday in the journal Proceedings of the National Academy of Sciences is another step in overcoming one of the biggest technical hurdles confronting stem cell researchers: when exactly to inject the cells into patients.

The results suggest that human embryonic stem cells, once injected into people, will mature into the cells that surround them. No known human has ever received an injection of embryonic stem cells because so little is known about how those cells will mature once inside the body.

For now, Gage said his work is more geared toward understanding disease than to finding a cure.

"It's a way for us to begin to tease out the way these diseases develop," Gage said.

Human embryonic stem cells are created in the first days after conception and give rise to all the organs and tissues in the human body.

Scientists hope they can someday use stem cells to replace diseased tissue.

But many social conservatives, including President Bush, oppose the work because embryos are destroyed during research.

Stem cell researchers argue that mixing human and animal cells is the only way to advance the field because it's far too risky to experiment on people; so little is known about stem cells.

The center's steam plant building

The Fred Hutchinson Cancer Research Center, also known as Fred Hutch or The Hutch, is a cancer research institute established in 1975 in Seattle, Washington.[2][3]

History[edit]

The center grew out of the Pacific Northwest Research Foundation, founded in 1956 by Dr. William B. Hutchinson (1909–1997). The Foundation was dedicated to the study of heart surgery, cancer, and diseases of the endocrine system. Hutchinson's younger brother Fred (1919–1964), was a major league pitcher and manager who died of lung cancer at age 45. The next year, Dr. Hutchinson established the Fred Hutchinson Cancer Research Center as a division of the Pacific Northwest Research Foundation.[2]

In 1972, with the help of Senator Warren G. Magnuson, PNRF received federal funding under the National Cancer Act of 1971 to create in Seattle one of the 15 new NCI-designated Cancer Centers aimed at conducting basic research[4] called for under 1971 Act; the Fred Hutchinson Cancer Research Center became independent 1972 and its building opened three years later in 1975.[2][5][6][7][8]:3,5

The center was named an NCI-designated Comprehensive Cancer Center in 1976.[9]

In 1998, the center formed the Seattle Cancer Care Alliance (SCCA), a separate nonprofit corporation,[10] with UW Medicine, and Seattle Children's. This solidified the center's reach into clinical care and was essential for it retaining its NCI comprehensive center designation;[11] the designation was extended to the center's consortium including the SCCA in 2003.[9] SCCA's outpatient clinic first opened in January 2001.[11]

In 2001, The Seattle Times published a series of articles alleging that investigators at the center (including the Center's co-founder Dr. E. Donnall Thomas) were conducting unethical clinical studies on cancer patients. The paper alleged that in two cancer studies conducted in the 1980s and early 1990s, patients were not informed about all the risks of the study, nor about the study doctors' financial interest in study outcome. The paper also alleged that this financial interest may have contributed to the doctors' failure to halt the studies despite evidence that patients were dying sooner and more frequently than expected.[12] In response, the center formed a panel of independent experts to review its existing research practices, leading to adoption of "one of the nation's toughest conflict-of-interest rules."[13]

In 2014, the center announced that D. Gary Gilliland would become president and CEO in 2015;[14] he took over from Lawrence Corey who was appointed as the 4th President in 2010, following the retirement of Lee Hartwell.[15]

2014 also saw the organization adopt its longtime local nickname, "Fred Hutch", as its official name as part of a rebranding.[16]

In 2018, the center announced that it would expand into the former Lake Union steam plant, which previously housed ZymoGenetics.[17]

Notable faculty[edit]

The center has employed three recipients of the Nobel Prize in Physiology or Medicine:

- Linda Buck, Ph.D., who received the award in 2004 for solving many details of the olfactory system;[18] and
- E. Donnall Thomas, M.D., who received the award in 1990 for his pioneering work in bone-marrow transplantation and who died in 2012;[19][20] and
- Lee Hartwell, Ph.D., who received the honor in 2001 for his discoveries regarding the mechanisms that control cell division.[21] After retiring from leading the center in 2010, Hartwell left to join Arizona State University.[22]

Commercialization[edit]

The center is active in technology transfer. In 2013, it was one of the top ten biomedical research institutions in the field (excluding universities); it made 18 new deals with companies to develop inventions made at the center, and earned $10,684,882 in income from past deals it had signed.[23] Most notably, Juno Therapeutics, a company developing CAR-T immunotherapy for cancer and that raised $314 million in venture capital investments and had a $265 million initial public offering in 2014, was started based on inventions made at the center.[24] As of 2015, about twenty companies had been started based on center inventions since 1975, including Immunex and Icos.[24]

Campus[edit]

The institute's main campus consists of thirteen buildings on fifteen acres (6.1 ha) in the South Lake Union neighborhood of Seattle.[25]

In 1987, the center began exploring possible new homes to replace its 9-building campus on First Hill that it was set to outgrow.[26][27] A site in the South Lake Union neighborhood, envisioned by the city as a future high-tech and biotechnology hub,[28] was chosen in September 1988 after a deal to move to Fremont fell through earlier that year.[29][30] The first phase of the campus, designed by firm Zimmer Gunsul Frasca Partnership,[31] began construction in 1991 and opened on June 1, 1993 in a ceremony that included the burying of a time capsule set to open in 2093.[32][33]

The campus is accessible via the Mercer Street exit of Interstate 5 as well as several public transportation routes, including the South Lake Union Streetcar.[34]

Originally published October 3, 2015 at 7:34 pm

The Birth Defects Research Laboratory at the University of Washington has for decades been a source of donated fetal tissue important to medical research, but the lab reports donations have fallen dramatically since the Planned Parenthood video controversy began in July.

By JoNel Aleccia / Seattle Times health reporter

As undercover videos released by anti-abortion activists roiled the nation this summer, sparking outrage directed at Planned Parenthood and reigniting questions about the use of tissue from aborted fetuses, the Birth Defects Research Laboratory at the University of Washington quietly continued the work it has done for more than 50 years.

Since 1964, the Seattle lab has been a federally funded hub for the collection and distribution of tissues for research, obtained from miscarriages, stillbirths and abortions — including, recently, donations from a Planned Parenthood clinic in Washington state.

Few people outside of the scientific community realize that the lab exists, said Theresa Naluai-Cecchini, a research scientist at the site since 2011.

"We sort of fly under the radar," she said.

But the tissues — fetal brain, liver, heart, kidney and other cells — long have been used at Seattle's top science centers, as well as sites nationwide. Researchers at Fred Hutchinson Cancer Research Center, Seattle Children's and the Allen Institute for Brain Science, among others, say the tissue has been crucial for local study of diseases and disorders as diverse as genetic heart defects, kidney malformations and macular degeneration.

In past decades, fetal cells were used to develop vaccines for diseases including polio, rubella and chickenpox, and they're now being used in research of HIV, Alzheimer's disease, autism, spinal-cord injuries and other conditions.

"Our scientists learn so much from these fetuses," said Stacey DiNuzzo, a spokeswoman for Seattle Children's.

Local abortion foes say they've known for years about the UW lab and consistently have questioned the need to obtain the tissue.

"Obviously, we don't object to research, but we do object to research from sources that we see as unethical," said Dan Kennedy, chief executive at Human Life of Washington, the state affiliate of the group National Right to Life. "It is a gruesome, gruesome practice and we would urge all of those involved in it to get out of it."

Fetal cells are prized for some research because they replicate rapidly and can adapt quickly to new uses. Federal law prohibits exchanging the tissues for profit, allowing fees to be charged only for costs such as transportation, processing and storage.

The UW lab, founded by Dr. Thomas Shepard, a pediatrician commonly regarded as the "grandfather of teratology," or the study of birth defects, typically aims for a low profile. But controversy over covert videos released by the anti-abortion group The Center for Medical Progress, which prompted a Congressional hearing last week, is having a chilling effect on the lab's work, said Naluai-Cecchini, the research scientist.

Donations decline

In 2014, the lab collected 596 fetal samples from consenting women at two area hospitals and seven stand-alone clinics, and distributed 1,109 separate tissues to more than 60 researchers, Naluai-Cecchini said. The UW receives nearly $700,000 a year, including overhead costs, from the National Institutes of Health (NIH) to fund the lab, which has a repository of nearly 2,000 fetal samples from 370 individual donors.

Since July, when the videos surfaced purporting to show Planned Parenthood executives callously negotiating the sale of fetal parts, tissue donations have dropped dramatically, Naluai-Cecchini said.

"Most days, we have at least a single case to process," she said. "Recently, we've had weeks where we've no tissue samples at all."

The reason?

"I think that the women may hear that the clinics are profiting from the tissue," she said.

The allegation had traction. Republican political leaders in several states called for investigations of Planned Parenthood's practices. Cecile Richards, the organization's national president, was summoned to testify before a congressional committee, where critics such as Rep. Jim Jordan, a Republican from Ohio, called the videos "barbaric and repulsive" and accused the organization of seeking to make money from aborted babies.

Richards, however, said the videos were heavily edited to mischaracterize the organization and that Planned Parenthood facilitates donate a small amount of fetal tissue nationwide and recover only processing expenses, as allowed by law.

That defense is echoed by Naluai-Cecchini, who said the UW lab charges researchers a flat fee of $200 a day to process and ship tissue. Last year the lab received a little less than $50,000 for those services.

"We don't compensate the clinics for their tissue, and we don't compensate the donors," she said.

Fewer than 20 women agreed to donate tissue last year from among more than 3,000 who had abortions at centers run by Planned Parenthood of Greater Washington and Northern Idaho, according to spokeswoman Tanya Riordan. She declined to say which of the affiliate's nine sites participated in tissue donation, out of fear that activists would attack the facilities, endangering patients and staff. The organization's Pullman center was the target of arson last month.

Similarly, scientists at Seattle Children's and Fred Hutch who use or have used fetal tissue in research declined to be identified individually, saying they fear they could be the subject of harassment — or worse.

But, through representatives, the scientists emphasized that the tissue is donated by consenting patients, including many who suffer miscarriages or who must end pregnancies because the fetuses have genetic defects or other problems.

Ed Lein, an researcher with the Allen Institute for Brain Science, said tissue from the UW lab was used in the reference atlas for BrainSpan, a unique resource that details the complete set of genes involved in brain development across the human life span.

"We recognize the extraordinary value of this precious resource," he wrote in an email. "And our approach to creating high quality public data sets allows us to put important tools in the hand of thousands of researchers around the world."

Some question need

Naluai-Cecchini said she has personally worked with parents who find comfort in the idea of donating the tissue to help scientists find treatments or cures for the conditions that claimed their children.

"The couples desire something good to come out of their loss," she said.

NIH expects to spend about $76 million on fetal-tissue research this year, part of some $280 million allocated since 2011. But that's a small fraction of the $581 million spent on human embryonic stem-cell research, and about $1.94 billion for adult stem-cell research in the same time period.

Some scientists say the need for fetal-tissue research is waning, and that other techniques, such as using induced pluripotent stem cells or stem cells harvested from umbilical cords, offer more hope without the ethical problems of abortion.

Theresa Deisher, a Seattle molecular biologist who co-filed a 2010 lawsuit to shut down NIH support for embryonic stem-cell research, said the use of fetal tissue is "unnecessary — and it's not useful."

"Our research is dedicated to providing alternatives so that no one will feel compelled to work with that material," said Deisher, president of Sound Choice Pharmaceutical Institute. She said she has worked with The Center for Medical Progress, the group responsible for the Planned Parenthood videos.

Researchers at Fred Hutch, however, said that in some cases — the environment of the fetal bone marrow, for instance — the cells can't be replaced.

"In situations where other options are available, they are used, but fetal tissues have unique properties," spokeswoman Rhonda Curry said in a statement on behalf of the scientists.

At the UW, Naluai-Cecchini said staffers hope the controversy wanes so that they can continue to concentrate on providing basic tools for research that may save lives.

"Every sample that comes through our doors is precious and valuable," she said. "And they go to someone who wants to do something great."

Dr. Thomas H. Shepard, a University of Washington pediatrician and scientist whose work shaped the study of birth defects — including recent confirmation of the devastating effects of the Zika virus — died Monday. He was 93.

By JoNel Aleccia / Seattle Times health reporter

Dr. Thomas H. Shepard, a University of Washington pediatrician and scientist known as a pioneer in teratology, the study of birth defects, died Monday at a local hospital, family members said. He was 93.

His influence in his field loomed large. It ranged from the founding of the nation's oldest fetal-tissue laboratory, in 1964 at the UW, to the creation of "Shepard's criteria," the set of rules published in 1994 used to discern whether an outside agent could be a teratogen — something that would disrupt normal development in the womb.

The criteria were cited as recently as April, when the Centers for Disease Control and Prevention confirmed that there was no doubt the Zika virus exploding across Latin America and the Caribbean caused microcephaly and other serious birth defects.

Sonja Rasmussen, president of the Teratology Society, of which Dr. Shepard was a charter member and past president, cited the Zika decision as just one of his many contributions.

"Dr. Shepard has had a monumental and long-lasting impact on the field of teratology — as a scientist, mentor, teacher and colleague," she said. "He will be missed."

He spent his entire academic career at the UW and at Seattle Children's, though he was a visiting investigator at sites including the Carnegie Institution in Washington, D.C., and at the University of Copenhagen, according to a 2009 tribute by friend and colleague Dr. Alan G. Fantel, a pediatrician and geneticist at the UW.

Dr. Shepard's medical practice combined pediatrics, endocrinology, dysmorphology and teratology, and he treated many patients from infancy through adulthood, Fantel noted. He had a keen interest in achondroplasia, a form of short-limbed dwarfism, and in phenylketonuria, or PKU, for which nearly all newborns are now tested, as well as in many other disorders.

He authored 13 editions of the Catalog of Teratogenic Agents, a comprehensive compilation of chemical and environmental agents that can cause birth defects.

Dr. Godfrey Oakley, a student of Shepard's who went on to head the CDC's birth-defects division, called Shepard a "giant" in the field.

"His book that listed chemicals and their effects on causing birth defects has influenced the clinical care of millions of pregnant women around the world," Oakley said.

Dr. Shepard was born in Milwaukee, Wis., in 1923. He received an undergraduate degree from Amherst College in 1945 and his medical degree from the University of Rochester in 1948.

He married Alice Kelly in 1946 and had three daughters, Ann Uomoto, Betsy Hardin and Donna Richards. Kelly died in 2004 after a long illness. In 2006, when he was 83, he married Gretchen McCoy, who survives.

Dr. Shepard, who lived in Bellevue, was a fierce and dedicated sailor, recalled daughter Donna Richards, of Portland, Ore. The family built a cabin on Shaw Island in the late 1950s and visited frequently.

"As far as sailing goes, he could be very charming, telling us all we'd only be on the lake for an hour," Richards recalled with a laugh. "Then as soon as we got on the boat, he'd turn into Captain Bly and not let us go back for hours."

Dr. Shepard was also an avid artist who worked primarily in watercolor.

Despite his considerable accomplishments, he was always quite modest, friends and colleagues recalled.

"He was an understated guy," his nephew, Michael Shepard, recalled. "He didn't walk around telling people how important he was."

Funeral arrangements are pending.

In addition to his wife, Dr. Shepard is survived by his daughters, six grandchildren and five great-grandchildren.

In Memoriam: Thomas H. Shepard, M.D., Pioneer in Embryology and Teratology

Abstract : Dr. Thomas H. Shepard died on October 3, 2016 at the age of 93. He was a major figure in the fields of teratology, embryonic and fetal pathology, and pediatrics. He was beloved by his colleagues as he was by the many students and fellows whom he taught, mentored and befriended. His contributions to teratology are extraordinary and he is greatly missed.Birth Defects Research 109:533–534, 2017.© 2017 Wiley Periodicals, Inc.

In memoriam

Tom Shepard died on October 3, 2016 at the age of 93 (Fig. 1). He was a major figure in the fields of teratology, embryonic and fetal pathology, and pediatrics. Following medical school at the University of Rochester, Tom joined the faculty of the University of Washington in the Department of Pediatrics. There, he spent his entire career, starting out in pediatric endocrinology but moving to teratology and embryonic development following a fellowship first with the late Jim Wilson at the University of Florida and later, with James Ebert at the Carnegie Institute in Washington DC.

Tom founded the Division of Human Embryology and Teratology in 1964. The laboratory he developed and directed until he retired in 1993 remains funded by the oldest grant in the portfolio of the National Institute of Child Health and Human Development. This laboratory served as a magnet for students, fellows, and scholars worldwide who came to learn and collaborate with him and his colleague Dave Smith. Together, they trained much of a generation of teratologists and dysmorphologists whose students and fellows still represent a substantial portion of the scientists and physicians studying and practicing in those fields today. The scientists Tom attracted to his laboratory represented many diverse disciplines. They included geneticists, dysmorphologists, anatomists, pharmacologists, toxicologists, engineers, dentists, surgeons, epidemiologists, anthropologists, and pathologists among others. All came to learn from Tom but even more importantly, to share and apply their knowledge and skills to questions of normal and abnormal development. He truly respected these individuals and with them made significant contributions to the field of Teratology.

Tom pioneered the collection and study of fresh human embryos and fetuses in the United States, a process made possible by relatively liberal laws in the State of Washington. He was able to document both normal and abnormal development, constructing standards that remain in use today.

Tom's work was broad. It included normal embryology, embryonic and fetal pathology, developmental physiology and metabolism and effects of embryonic vitamin and nutrient deficiencies. After spending time studying with Denis New of Cambridge University, he adapted whole embryo culture to experimental teratology where it remains a major research tool.

In 1973 Tom published the first edition of the Catalog of Teratogenic Agents. It included information on 649 exposures in 211 pages. By contrast, the 12th edition, which he coauthored with the late Ron Lemire, included 3,261 agents in 545 pages. For decades, the Catalog has served as a basic tool in experimental teratology and used worldwide to counsel pregnant women.

Tom served on the TERIS (Teratogen Information System) Advisory Board from 1988 until his death. As a board member he helped Jan Friedman and others on the board formulate teratogenic risk assessments for more than 1,700 drugs and other environmental agents. Often he added agents that had been reviewed for TERIS to his own Catalog of Teratogenic Agents, particularly if they were “juicy” ones. Meaning a lot of teratology data was available for those agents. Like others on the Advisory Board, Tom served on the Board (mostly without compensation) because of his commitment to helping clinicians interpret the scientific evidence within the context of a patient's pregnancy. Although it is fair to describe all members of the TERIS Advisory Board as opinionated, Tom sometimes could be particularly stubborn when he strongly disagreed with the assessments of other board members. This often led to lengthy discussions as Tom calmly and steadfastly tried to convince the others that he was right.

In 2002, OTIS/MotherToBaby established a lectureship in his name to be presented every year at the annual meeting, and he richly deserved this honor. He attended every OTIS meeting until his declining health made it difficult for him to travel. For decades health care professionals called him for advice on the potential teratogenicity of a patient's exposure. Many of his patients were forever grateful to him for the compassion he showed and the advice he gave to them; and they never lost touch with him. Tom was an ardent supporter of teratogen information services and in 1994, with assistance from the Washington State Department of Health, Tom became co - director of CARE Northwest, a teratogen information service located at the University of Washington in Seattle. When state funding for CARE Northwest ended in 1996, he personally paid the salary of a teratogen information specialist for 10 years to keep the service going. Such was his commitment to ensuring that the science of teratology was made useful and easily accessible for clinicians and their patients.

Tom was driven in science and pediatrics. In addition to his laboratory studies and authorship he performed teaching and clinical duties in the Department of Pediatrics and Seattle Children's Hospital while serving on numerous scientific and governmental boards. He was in great demand and traveled extensively.

Tom was married to Alice Kelly in 1946. They had three daughters, Annie, Donna, and Betsy. Alice died in 2004 and in 2006 he married Gretchen McCoy. Tom had many interests outside the laboratory and clinic. He loved family and friends, he loved the San Juan Islands in Washington State and he was a truly demonic sailor. Tom grew up sailing in Massachusetts and raced on the waters of Lake Washington and Puget Sound. It can be said fairly confidently that he never lost a race even when it meant sailing in a direction opposite to every other boat around him. He had a vigorous and often ribald sense of humor that abruptly vanished when the starting gun sounded and the race began. Then his dedication and seriousness rivaled that in the laboratory and heaven help the crew member who messed up.

Tom was a charter member of the Teratology Society and an early president. He presided over an early annual Society meeting near Mt. Rainier that set a standard for meetings and that many of us will never forget. He was beloved by Society members as he was by the many students, fellows and colleagues whom he taught, mentored and befriended. His contributions to teratology are extraordinary and he is greatly missed.

From Bio of Edward Donnall Thomas (1920–2012) in Nature Magazine

See **Dr. Edward Donnall "Don" Thomas (born 1920)**

Source : [HP006I][GDrive]

[...] In 1955, Thomas was appointed physician-in-chief at the Mary Imogene Bassett Hospital in Cooperstown, New York. Here he became fascinated by the discovery that rodents given a lethal dose of radiation could be rescued by an intravenous infusion of marrow cells from a donor. **In 1957, Thomas treated a patient with leukaemia using high doses of total-body irradiation to wipe out the cancer, and then gave them an infusion of marrow cells from an identical twin. The transplant was at first successful, although the patient later died from a recurrence of the leukaemia.**

Meanwhile, the medical literature was charting numerous cases of patients with blood disorders who had been treated using marrow transplantation from healthy family members. All the patients died from infections or severe immune reactions that were not predicted from studies in inbred rodents. Many investigators left the field, pronouncing it a dead end.

Thomas did not give up. In 1957 he began experimenting in dogs. Like humans, dogs have unusual phenotypic diversity, a well-mixed gene pool and can develop haematological diseases, including non-Hodgkin lymphoma. In late 1963, Thomas set up his laboratory at the United States Public Health Service (USPHS) Hospital in Seattle, which was affiliated to the University of Washington's medical school.

When I joined his small band of scientists in 1965 as a research fellow, transplantation was not a widely known concept. Indeed, the university's print shop once produced letterhead stationery for us that read "Division of Hematology and Transportation". A remarkable thing about Thomas's leadership style was that he was happy to give people like me a free hand in innovating, as long as it helped the patients.

Under Thomas's guidance, we spent the 1960s developing high-intensity irradiation treatments to eradicate patients' cancer cells and establishing the importance of tissue matching for transplant outcome. To control and treat graft-versus-host disease, we developed drug combinations to suppress the immune system and produced antibodies against human lymphocytes — which once involved a 1.5-hour chase of an antibody-producing horse. Our total-body irradiation sources were set up in a Second World War underground bunker.

Work with patients began in 1969 at the USPHS hospital. Initial survival rates were low, and unexpected problems required going back and forth between bench and bedside — something that remained a hallmark of Thomas's work. By 1979, after performing a number of transplants, we were able to describe a phenomenon called graft-versus-tumour effects, in which donor lymphocytes help to eliminate residual malignant cells. There are patients who received transplants in 1971 still alive today.

Progress has been slow but steady. Early marrow donors were siblings. In 1979, the first patient with leukaemia was successfully treated with a transplant from an unrelated donor using new immunosuppressant drugs. This success sparked Thomas and others to set up international marrow-donor programmes. Transplant outcomes have improved, with survival rates for some diseases, such as aplastic anaemia, close to 95%.

In 1972, the US government closed the USPHS hospital. This prompted the founding of the private Fred Hutchinson Cancer Research Center (the Hutch), with close ties to the University of Washington's medical school. Thomas headed the medical oncology divisions at both.

Over the years, Thomas's team trained hundreds of young investigators. As one of them put it: "Virtually every major transplant centre in the world got its start by sending someone to train under Don Thomas." Owing to his influence, the Hutch's clinical focus has always been the patient, and its approach, one of teamwork. After retiring in 1989, Thomas continued writing manuscripts, lecturing and serving as an ambassador for the place. [...]

ICANN headquarters in the Playa Vista neighborhood of Los Angeles

The **Internet Corporation for Assigned Names and Numbers** (**ICANN** /ˈaɪkæn/ *EYE-kan*) is an American multistakeholder group and nonprofit organization responsible for coordinating the maintenance and procedures of several databases related to the namespaces and numerical spaces of the Internet, ensuring the network's stable and secure operation.[1] ICANN performs the actual technical maintenance work of the Central Internet Address pools and DNS root zone registries pursuant to the Internet Assigned Numbers Authority (IANA) function contract. The contract regarding the IANA stewardship functions between ICANN and the National Telecommunications and Information Administration (NTIA) of the United States Department of Commerce ended on October 1, 2016, formally transitioning the functions to the global multistakeholder community.[2][3][4][5]

Much of its work has concerned the Internet's global Domain Name System (DNS), including policy development for internationalization of the DNS system, introduction of new generic top-level domains (TLDs), and the operation of root name servers. The numbering facilities ICANN manages include the Internet Protocol address spaces for IPv4 and IPv6, and assignment of address blocks to regional Internet registries. ICANN also maintains registries of Internet Protocol identifiers.

ICANN's primary principles of operation have been described as helping preserve the operational stability of the Internet; to promote competition; to achieve broad representation of the global Internet community; and to develop policies appropriate to its mission through bottom-up, consensus-based processes.[6]

ICANN's creation was announced publicly on September 17, 1998,[7] and it formally came into being on September 30, 1998, incorporated in the U.S. state of California.[8] Originally headquartered in Marina del Rey in the same building as the University of Southern California's Information Sciences Institute (ISI), its offices are now in the Playa Vista neighborhood of Los Angeles in Facebook's old office.

History[edit]

Before the establishment of ICANN, the IANA function of administering registries of Internet protocol identifiers (including the distributing top-level domains and IP addresses) was performed by Jon Postel, a Computer Science researcher who had been involved in the creation of ARPANET, first at UCLA and then at USC-ISI.[9][10] In 1997 Postel testified before Congress that this had come about as a "side task" to this research work.[11] The Information

Sciences Institute was funded by the U.S. Department of Defense, as was SRI International's Network Information Center, which also performed some assigned name functions.[12]

As the Internet grew and expanded globally, the U.S. Department of Commerce initiated a process to establish a new organization to perform the IANA functions. On January 30, 1998, the National Telecommunications and Information Administration (NTIA), an agency of the U.S. Department of Commerce, issued for comment, "A Proposal to Improve the Technical Management of Internet Names and Addresses." The proposed rule making, or "Green Paper",[13] was published in the Federal Register on February 20, 1998, providing opportunity for public comment. NTIA received more than 650 comments as of March 23, 1998, when the comment period closed.[14]

The Green Paper proposed certain actions designed to privatize the management of Internet names and addresses in a manner that allows for the development of competition and facilitates global participation in Internet management. The Green Paper proposed for discussion a variety of issues relating to DNS management including private sector creation of a new not-for-profit corporation (the "new corporation") managed by a globally and functionally representative board of directors.[15] ICANN was formed in response to this policy.[*citation needed*] ICANN managed the Internet Assigned Numbers Authority (IANA) under contract to the United States Department of Commerce (DOC) and pursuant to an agreement with the IETF.[16]

ICANN was incorporated in California on September 30, 1998, with entrepreneur and philanthropist Esther Dyson as founding chairwoman.[8] It is a nonprofit public benefit corporation "organized under the California Nonprofit Public Benefit Corporation Law for charitable and public purposes."[17] ICANN was established in California due to the presence of Jon Postel, who was a founder of ICANN and was set to be its first Chief Technology Officer prior to his unexpected death. ICANN formerly operated from the same Marina del Rey building where Postel formerly worked, which is home to an office of the Information Sciences Institute at the University of Southern California. However, ICANN's headquarters is now located in the nearby Playa Vista neighborhood of Los Angeles.

Per its original by-laws,[18] primary responsibility for policy formation in ICANN was to be delegated to three supporting organizations (Address Supporting Organization, Domain Name Supporting Organization, and Protocol Supporting Organization), each of which was to develop and recommend substantive policies and procedures for the management of the identifiers within their respective scope. They were also required to be financially independent from ICANN.[19] As expected, the regional Internet registries and the IETF agreed to serve as the Address Supporting Organization and Protocol Supporting Organization respectively,[20][21] and ICANN issued a call for interested parties to propose the structure and composition of the Domain Name Supporting Organization.[22] In March 1999, the ICANN Board, based in part on the DNSO proposals received, decided instead on an alternate construction for the DNSO which delineated specific constituencies bodies within ICANN itself,[23][24] thus adding primary responsibility for DNS policy development to ICANN's existing duties of oversight and coordination.

On July 26, 2006, the United States government renewed the contract with ICANN for performance of the IANA function for an additional one to five years.[25] The context of ICANN's relationship with the U.S. government was clarified on September 29, 2006 when ICANN signed a new memorandum of understanding with the United States Department of Commerce (DOC).[26] This document gave the DOC oversight over some of the ICANN operations.[26][27]

During July 2008, the DOC reiterated an earlier statement[28] that it has "no plans to transition management of the authoritative root zone file to ICANN". The letter also stresses the separate roles of the IANA and VeriSign.[29]

On September 30, 2009, ICANN signed an agreement with the DOC (known as the "Affirmation of Commitments") that confirmed ICANN's commitment to a multistakeholder governance model,[30] but did not remove it from DOC oversight and control.

On March 10, 2016, ICANN and the DOC signed a historic, culminating agreement to finally remove ICANN and IANA from the control and oversight of the DOC.[31] On October 1, 2016, ICANN was freed from U.S. government oversight.[32]

Notable events[edit]

On March 18, 2002, publicly elected At-Large Representative for North America board member Karl Auerbach sued ICANN in Superior Court in California to gain access to ICANN's accounting records without restriction. Auerbach won.[33]

During September and October 2003, ICANN played a crucial role in the conflict over VeriSign's "wild card" DNS service Site Finder. After an open letter from ICANN issuing an ultimatum to VeriSign, later endorsed by the Internet Architecture Board,[34] the company voluntarily ended the service on October 4, 2003. After this action, VeriSign filed a lawsuit against ICANN on February 27, 2004, claiming that ICANN had exceeded its authority. By this lawsuit, VeriSign sought to reduce ambiguity about ICANN's authority. The antitrust component of VeriSign's claim was dismissed during August 2004. VeriSign's challenge that ICANN overstepped its contractual rights is currently outstanding. A proposed settlement already approved by ICANN's board would resolve VeriSign's challenge to ICANN in exchange for the right to increase pricing on .com domains. At the meeting of ICANN in Rome, which took place from March 2 to 6, 2004, ICANN agreed to ask approval of the U.S. Department of Commerce for the Waiting List Service of VeriSign.[*citation needed*]

On May 17, 2004, ICANN published a proposed budget for the year 2004–05. It included proposals to increase the openness and professionalism of its operations, and greatly increased its proposed spending from US$8.27 million to $15.83 million. The increase was to be funded by the introduction of new top-level domains, charges to domain registries, and a fee for some domain name registrations, renewals and transfers (initially USD 0.20 for all domains within a country-code top-level domain, and USD 0.25 for all others).[*citation needed*] The Council of European National Top Level Domain Registries (CENTR), which represents the Internet registries of 39 countries, rejected the increase, accusing ICANN of a lack of financial prudence and criticizing what it describes as ICANN's "unrealistic political and operational targets". Despite the criticism, the registry agreement for the top-level domains jobs and travel includes a US$2 fee on every domain the licensed companies sell or renew.[35]

After a second round of negotiations during 2004, the TLDs eu, asia, travel, jobs, mobi, and cat were introduced during 2005.

> ICANN meeting, Los Angeles USA, 2007. The sign refers to Vint Cerf, then chairman of the board of directors, who is working on the so-called Interplanetary Internet.

On February 28, 2006, ICANN's board approved a settlement with VeriSign in the lawsuit resulting from SiteFinder that involved allowing VeriSign (the registry) to raise its registration fees by up to 7% a year.[36] This was criticised by a few members of the U.S. House of Representatives' Small Business Committee.[37]

During February 2007, ICANN began procedures to end accreditation of one of their registrars, RegisterFly amid charges and lawsuits involving fraud, and criticism of ICANN's management of the situation. ICANN has been the subject of criticism as a result of its handling of RegisterFly, and the harm caused to

thousands of clients as a result of what has been termed ICANN's "laissez faire attitude toward customer allegations of fraud".[38]

On May 23, 2008, ICANN issued enforcement notices against ten accredited registrars and announced this through a press release entitled "'Worst Spam Offenders' Notified by ICANN, Compliance system working to correct Whois and other issues."[39] This was largely in response to a report issued by KnujOn, called "The 10 Worst Registrars" in terms of spam advertised junk product sites and compliance failure.[40] The mention of the word "spam" in the title of the ICANN memo is somewhat misleading since ICANN does not address issues of spam or email abuse. Website content and usage are not within ICANN's mandate. However, the KnujOn report details how various registrars have not complied with their contractual obligations under the Registrar Accreditation Agreement (RAA).[41] The main point of the KnujOn research was to demonstrate the relationships between compliance failure, illicit product traffic, and spam. The report demonstrated that out of 900 ICANN accredited registrars, fewer than 20 held 90% of the web domains advertised in spam. These same registrars were also most frequently cited by KnujOn as failing to resolve complaints made through the Whois Data Problem Reporting System (WDPRS).

On June 26, 2008, the ICANN Board started a new process of TLD naming policy to take a "significant step forward on the introduction of new generic top-level domains." This program envisioned the availability of many new or already proposed domains, as well a new application and implementation process.[42]

On October 1, 2008, ICANN issued breach notices against Joker and Beijing Innovative Linkage Technology Ltd.[43] after further researching reports and complaints issued by KnujOn. These notices gave the registrars 15 days to fix their Whois investigation efforts.

In 2010, ICANN approved a major review of its policies with respect to accountability, transparency, and public participation by the Berkman Center for Internet and Society at Harvard University.[44] This external review was an assistance of the work of ICANN's Accountability and Transparency Review team.[45]

On February 3, 2011, ICANN announced that it had distributed the last batch of its remaining IPv4 addresses to the world's five regional Internet registries, the organizations that manage IP addresses in different regions. These registries began assigning the final IPv4 addresses within their regions until they ran out completely.[46]

On June 20, 2011, the ICANN board voted to end most restrictions on the names of generic top-level domains (gTLD).[47][48][49] Companies and organizations became able to choose essentially arbitrary top-level Internet domain names. The use of non-Latin characters (such as Cyrillic, Arabic, Chinese, etc.) is also allowed in gTLDs. ICANN began accepting applications for new gTLDS on January 12, 2012.[47] The initial price to apply for a new gTLD was set at $185,000[50] and the annual renewal fee is $25,000.[51][52]

Following the 2013 NSA spying scandal, ICANN endorsed the Montevideo Statement,[53] although no direct connection between these could be proven.[54]

On October 1, 2016, ICANN ended its contract with the United States Department of Commerce National Telecommunications and Information Administration (NTIA) and entered the private sector.[55]

The European Union's General Data Protection Regulation (active since May 25, 2018) impacted on ICANN operations, which the latter tried to fix through last-minute changes.[*clarification needed*][56] The deadline coincided with French President Macron's hosting of technology businesspeople such as Facebook CEO Mark Zuckerberg, Microsoft CEO Satya Nadella, Uber CEO Dara Khosrowshahi, IBM CEO Ginni Rometty, Intel CEO Brian Krzanich, Samsung President Young Sohn, and SAP CEO Bill McDermott.

Structure[edit]

From its founding to the present, ICANN has been formally organized as a nonprofit corporation "for charitable and public purposes" under the California Nonprofit Public Benefit Corporation Law. It is managed by a 16-member board of directors composed of eight members selected by a nominating committee on which all the constituencies of ICANN are represented; six representatives of its Supporting Organizations, sub-groups that deal with specific sections of the policies under ICANN's purview; an at-large seat filled by an at-large organization; and the President / CEO, appointed by the board.[57]

There are currently three supporting organizations: the Generic Names Supporting Organization (GNSO) deals with policy making on generic top-level domains (gTLDs);[58] the Country Code Names Supporting Organization (ccNSO) deals with policy making on country-code top-level domains (ccTLDs); the Address Supporting Organization (ASO) deals with policy making on IP addresses.[59]

ICANN also relies on some advisory committees and other advisory mechanisms to receive advice on the interests and needs of stakeholders that do not directly participate in the Supporting Organizations.[60] These include the Governmental Advisory Committee (GAC), which is composed of representatives of a large number of national governments from all over the world; the At-Large Advisory Committee (ALAC), which is composed of individual Internet users from around the world selected by each of the Regional At-Large Organizations (RALO)[61] and Nominating Committee; the Root Server System Advisory Committee, which provides advice on the operation of the DNS root server system; the Security and Stability Advisory Committee (SSAC), which is composed of Internet experts who study security issues pertaining to ICANN's mandate; and the Technical Liaison Group (TLG), which is composed of representatives of other international technical organizations that focus, at least in part, on the Internet.[62]

Governmental Advisory Committee[edit]

Governmental Advisory Committee representatives

Representatives[edit]

The Governmental Advisory Committee has representatives from 112 states (108 UN members, the Holy See, Cook Islands, Niue and Taiwan), Hong Kong, Bermuda, Montserrat, the European Commission and the African Union Commission.[63]

Observers[edit]

In addition the following organizations are GAC Observers:[64]

- African Telecommunications Union
- Asia-Pacific Telecommunity
- Caribbean Telecommunications Union (CTU)
- Commonwealth Telecommunications Organisation (CTO)
- Council of Europe

- Economic Commission for Africa (ECA)
- European Broadcasting Union
- European Organization for Nuclear Research (CERN)
- European Space Agency
- International Labour Office
- International Telecommunication Union (ITU)
- International Criminal Police Organization (INTERPOL)
- International Red Cross and Red Crescent Movement
- Latin American Association of Telecom Regulatory Agencies (REGULATEL)
- League of Arab States
- New Partnership for Africa's Development (NEPAD)
- Organisation for Economic Co-operation and Development
- The Organization for Islamic Cooperation
- Organization of American States
- Organisation internationale de la Francophonie (OIF)
- Pacific Islands Forum
- Secretariat of the Pacific Community (SPC)
- Inter-American Telecommunication Commission (CITEL)
- International Criminal Court
- United Nations Educational Scientific and Cultural Organization (UNESCO)
- Universal Postal Union
- World Bank
- World Health Organization (WHO)
- World Intellectual Property Organization (WIPO)
- World Meteorological Organization
- World Trade Organization

Trusted Community Representatives[edit]

As the operator of the IANA domain name functions, ICANN is responsible for the DNSSEC management of the root zone. While day to day operations are managed by ICANN and Verisign, the trust is rooted in a group of Trusted Community Representatives. The members of this group must not be affiliated with ICANN, but are instead members of the broader DNS community, volunteering to become a Trusted Community Representative. The role of the representatives are primarily to take part in regular key ceremonies at a physical location, organized by ICANN, and to safeguard the key materials in between.[65]

Democratic input[edit]

In the Memorandum of understanding that set up the relationship between ICANN and the U.S. government, ICANN was given a mandate requiring that it operate "in a bottom up, consensus driven, democratic manner." However, the attempts that ICANN have made to establish an organizational structure that would allow wide input from the global Internet community did not produce results amenable to the current Board. As a result, the At-Large constituency and direct election of board members by the global Internet community were soon abandoned.[66]

ICANN holds periodic public meetings rotated between continents for the purpose of encouraging global participation in its processes. Resolutions of the ICANN Board, preliminary reports, and minutes of the meetings, are published on the ICANN website, sometimes in real time. However, there are criticisms from ICANN constituencies including the Noncommercial Users Constituency (NCUC)[67] and the At-Large Advisory Committee (ALAC) that there is not enough public disclosure and that too many discussions and decisions take place out of sight of the public.[*citation needed*]

During the early 2000s, there had been speculation that the United Nations might assume control of ICANN,[68] followed by a negative reaction from the U.S. government[28] and worries about a division of the Internet.[69] The World Summit on the Information Society in Tunisia during November 2005 agreed not to get involved in the day-to-day and technical operations of ICANN. However it also agreed to establish an international Internet Governance Forum, with a consultative role on the future governance of the Internet. ICANN's Government Advisory Committee is currently established to provide advice to ICANN regarding public policy issues and has participation by many of the world's governments.[70]

Some have attempted to argue that ICANN was never given the authority to decide policy, e.g., choose new TLDs or exclude other interested parties who refuse to pay ICANN's US$185,000 fee, but was to be a technical caretaker. Critics[*who?*] suggest that ICANN should not be allowed to impose business rules on market participants, and that all TLDs should be added on a first-come, first-served basis and the market should be the arbiter of who succeeds and who does not.[*citation needed*]

Activities[edit]

Uniform Domain-Name Dispute Resolution Policy (UDRP)[edit]

One task that ICANN was asked to do was to address the issue of domain name ownership resolution for generic top-level domains (gTLDs). ICANN's attempt at such a policy was drafted in close cooperation with the World Intellectual Property Organization (WIPO), and the result has now become known as the Uniform Dispute Resolution Policy (UDRP). This policy essentially attempts to provide a mechanism for rapid, cheap and reasonable resolution of domain name conflicts, avoiding the traditional court system for disputes by allowing cases to be brought to one of a set of bodies that arbitrate domain

name disputes. According to ICANN policy, domain registrants must agree to be bound by the UDRP—they cannot get a domain name without agreeing to this.

Examination of the UDRP decision patterns has caused some[71] to conclude that compulsory domain name arbitration is less likely to give a fair hearing to domain name owners asserting defenses under the First Amendment and other laws, compared to the federal courts of appeal in particular.

Proposed elimination of public DNS whois[edit]

In 2013, the initial report of ICANN's Expert Working Group has recommended that the present form of Whois, a utility that allows anyone to know who has registered a domain name on the Internet, should be "abandoned". It recommends it be replaced with a system that keeps most registration information secret (or "gated") from most Internet users, and only discloses information for "permissible purposes".[72][73] ICANN's list of permissible purposes includes domain name research, domain name sale and purchase, regulatory enforcement, personal data protection, legal actions, and abuse mitigation.[74] Whois has been a key tool of investigative journalists interested in determining who was disseminating information on the Internet.[75] The use of whois by journalists is not included in the list of permissible purposes in the initial report.

Criticism[edit]

Since its creation, ICANN has been the subject of criticism and controversy.[76][77] In 2000, professor Michael Froomkin of the University of Miami School of Law argued that ICANN's relationship with the U.S. Department of Commerce is illegal, in violation of either the Constitution or federal statutes.[78] In 2009, the new *Affirmation of Commitments* agreement between ICANN and the U.S. Department of Commerce, that aimed to create international oversight, ran into criticism.[79]

During December 2011, the Federal Trade Commission stated ICANN had long failed to provide safeguards that protect consumers from online swindlers.[80]

TLD expansion[edit]

Also during 2011, seventy-nine companies, including The Coca-Cola Company, Hewlett-Packard, Samsung and others, signed a petition against ICANN's new TLD program (sometimes referred to as a "commercial landgrab"[81]), in a group organized by the Association of National Advertisers.[82] As of September 2014, this group, the Coalition for Responsible Internet Domain Oversight, that opposes the rollout of ICANN's TLD expansion program, has been joined by 102 associations and 79 major companies.[83] Partly as a response to this criticism, ICANN initiated an effort to protect trademarks in domain name registrations, which eventually culminated in the establishment of the Trademark Clearinghouse.

IBSA proposal (2011)[edit]

One controversial proposal, resulting from a September 2011 summit between India, Brazil, and South Africa (IBSA), would seek to move Internet governance into a "UN Committee on Internet-Related Policy" (UN-CIRP).[84] The action was a reaction to a perception that the principles of the 2005 Tunis Agenda for the Information Society have not been met.[84][85] The statement proposed the creation of a new political organization operating as a component of the United Nations to provide policy recommendations for the consideration of technical organizations such as ICANN and international bodies such as the ITU.[86] Subsequent to public criticisms, the Indian government backed away from the proposal.[87]

Montevideo Statement on the Future of Internet Cooperation (2013)[edit]

On October 7, 2013 the Montevideo Statement on the Future of Internet Cooperation was released by the managers of a number of organizations involved in coordinating the Internet's global technical infrastructure, loosely known as the "I*" (or "I-star") group. Among other things, the statement "expressed strong concern over the undermining of the trust and confidence of Internet users globally due to recent revelations of pervasive monitoring and surveillance" and "called for accelerating the globalization of ICANN and IANA functions, towards an environment in which all stakeholders, including all governments, participate on an equal footing". This desire to reduce United States association with the internet is considered a reaction to the ongoing NSA surveillance scandal. The statement was signed by the managers of the Internet Corporation for Assigned Names and Numbers (ICANN), the Internet Engineering Task Force, the Internet Architecture Board, the World Wide Web Consortium, the Internet Society, and the five regional Internet address registries (African Network Information Center, American Registry for Internet Numbers, Asia-Pacific Network Information Centre, Latin America and Caribbean Internet Addresses Registry, and Réseaux IP Européens Network Coordination Centre).[88][89][90]

Global Multistakeholder Meeting on the Future of Internet Governance (2013)[edit]

During October 2013, Fadi Chehadé, former President and CEO of ICANN, met with Brazilian President Dilma Rousseff in Brasilia. Upon Chehadé's invitation, the two announced that Brazil would host an international summit on Internet governance during April 2014.[91] The announcement came after the 2013 disclosures of mass surveillance by the U.S. government, and President Rousseff's speech at the opening session of the 2013 United Nations General Assembly, where she strongly criticized the American surveillance program as a "breach of international law". The "Global Multistakeholder Meeting on the Future of Internet Governance (NET mundial)" will include representatives of government, industry, civil society, and academia.[*citation needed*] At the IGF VIII meeting in Bali in October 2013 a commenter noted that Brazil intends the meeting to be a "summit" in the sense that it will be high level with decision-making authority.[92] The organizers of the "NET mundial" meeting have decided that an online forum called "/1net", set up by the I* group, will be a major conduit of non-governmental input into the three committees preparing for the meeting in April.[90][93][94]

The Obama administration that had joined critics of ICANN during 2011[95] announced in March 2014 that they intended to transition away from oversight of the IANA functions contract. The current contract that the United States Department of Commerce has with ICANN expired in 2015, in its place the NTIA will transition oversight of the IANA functions to the 'global multistakeholder community'.[96]

NetMundial Initiative (2014)[edit]

The NetMundial Initiative is a plan for international governance of the Internet that was first proposed at the Global Multistakeholder Meeting on the Future of Internet Governance (GMMFIG) conference (April 23–24, 2014)[97][98][99] and later developed into the NetMundial Initiative by ICANN CEO Fadi Chehadé along with representatives of the World Economic Forum (WEF)[100] and the Brazilian Internet Steering Committee (Comitê Gestor da Internet no Brasil), commonly referred to as "CGI.br".[101]

The meeting produced a nonbinding statement in favor of consensus-based decision-making. It represented a compromise and did not harshly condemn mass surveillance or support net neutrality, despite initial endorsement for that from Brazil. The final resolution says ICANN should be controlled internationally

by September 2015.[102] A minority of governments, including Russia, China, Iran and India, were unhappy with the final resolution and wanted multilateral management for the Internet, rather than broader multistakeholder management.[103]

A month later, the Panel on Global Internet Cooperation and Governance Mechanisms (convened by the Internet Corporation for Assigned Names and Numbers (ICANN) and the World Economic Forum (WEF) with assistance from The Annenberg Foundation), endorsed and included the NetMundial statement in its own report.[104]

During June 2014, France strongly attacked ICANN, saying ICANN is not a fit venue for Internet governance and that alternatives should be sought.[105]

.sucks domain[edit]

ICANN has received more than $60 million from gTLD auctions,[106] and has accepted the controversial domain name ".sucks" (referring to the primarily US slang for being inferior or objectionable).[107] sucks domains are owned and controlled by the Vox Populi Registry which won the rights for .sucks gTLD in November 2014.[108]

The .sucks domain registrar has been described as "predatory, exploitive and coercive" by the Intellectual Property Constituency that advises the ICANN board.[107] When the .sucks registry announced their pricing model, "most brand owners were upset and felt like they were being penalized by having to pay more to protect their brands."[109] Because of the low utility of the ".sucks" domain, most fees come from "Brand Protection" customers registering their trademarks to prevent domains being registered.[110]

Canadian brands had complained that they were being charged "exorbitant" prices to register their trademarks as premium names. FTC chair Edith Ramirez has written to ICANN to say the agency will take action against the .sucks owner if "we have reason to believe an entity has engaged in deceptive or unfair practices in violation of Section 5 of the FTC Act".[111] The Register reported that intellectual property lawyers are infuriated that "the dot-sucks registry was charging trademark holders $2,500 for .sucks domains and everyone else $10."[112]

U.S. Representative Bob Goodlatte has said that trademark holders are "being shaken down" by the registry's fees.[113] Jay Rockefeller says that .sucks is "a predatory shakedown scheme" and "Approving '.sucks', a gTLD with little or no public interest value, will have the effect of undermining the credibility ICANN has slowly been building with skeptical stakeholders."[107]

.islam, .halal top level domains[edit]

In a long-running dispute, ICANN has so far declined to allow a Turkish company to purchase the .islam and .halal gTLDs, after the Organisation of Islamic Cooperation objected that the gTLDs should be administered by an organization that represents all the world's 1.6 billion Muslims.[114] After a number of attempts to resolve the issue the domains are still held "on hold".[115]

.amazon gTLD dispute[edit]

In May 2019 ICANN decided in favor of granting exclusive administration rights to amazon.com for the .amazon gTLD after a 7 year long dispute with the Amazon Cooperation Treaty Organization (ACTO). [116][117]

Operation Ill Wind

Wikipedia Operation Ill Wind

US AG in 1991 - **William Pelham Barr (born 1950)**

Saved Wikipedia (Dec 23, 2020) - Operation Ill Wind

Source : [HK004C][GDrive]

Operation Ill Wind was a three-year investigation launched in 1986 by the United States Federal Bureau of Investigation into corruption by U.S. government and military officials, and private defense contractors. Charles "Chuck" Duff was the sole Air Force Action Officer responsible for developing, coordinating and implementing Air Force actions relating to the Department of Justice's "Ill Wind" procurement fraud investigation. Government officials, private individuals and companies were eventually convicted of various crimes including nine government officials, 42 Washington consultants and 7 military contractors,[1] as well as executives at GE, Boeing and United Technologies.[2][3]

[**Melvyn Robert Paisley (born 1924)**], appointed Assistant Secretary of the Navy in 1981 by Republican President Ronald Reagan,[4] was found to have accepted hundreds of thousands of dollars in bribes. He pleaded guilty to bribery and served four years in prison.[5]

James E. Gaines, Deputy Assistant Secretary of the Navy, took over when **Paisley** resigned his office.[6] Gaines was convicted of accepting an illegal gratuity and theft and conversion of government property. He was sentenced to six months in prison.[7]

Victor D. Cohen, Deputy Assistant Secretary of the Air Force, was the 50th conviction obtained under the Ill Wind probe when he pleaded guilty to accepting bribes and conspiring to defraud the government.[8]

Most worked for Unisys, pleading guilty to eight felonies, including the use of fraud, bribery and illegal campaign contributions to obtain billions of dollars in defense contracts.[9] Other top officials worked for Lee Telecommunications and Teledyne.[10]

The scandal led the United States Congress to pass the 1988 Procurement Integrity Act,[11] which regulates the pay that procurement officials can receive from contractors during the first year after they leave government, and forbids them providing bid and proposal information to their new employers.[12]

September 6, 1991 - AP News - "Unisys Pleads Guilty in Defense Fraud Case"

S ource : [HM001B][GDrive] , by JAMES ROWLEY

ALEXANDRIA, Va. (AP) _ Unisys Corp. pleaded guilty today to criminal charges in the huge Pentagon procurement scandal and agreed to pay the United States up to $190 million to settle claims arising from the Operation Ill Wind investigation.

"This $190 million settlement, the largest ever of its type, should carry a simple but necessary message: where individuals or corporations systematically defraud a procurement program, we'll use the full extent of the law to punish them," said Acting Attorney General [**William Pelham Barr (born 1950)**]. "The integrity of these programs demands it and the taxpayers deserve no less."

Unisys Chairman James A. Unruh said in a statement his company "must accept responsibility for the past action of a few people" associated with Sperry Corp., which was taken over by Burroughs Corp. in 1986 to form Unisys.

"All of us at Unisys have been angered and frustrated that the actions of a few have cast a cloud over a dedicated, ethical work force," Unruh said, adding "this unfortunate chapter is behind us."

Bill Beckham, a spokesman for the financially troubled computer maker and defense contractor, said, "The agreement was structured in such a way to allow us to remain financially viable. Unisys will pay the $190 million over a six-year period with a large part of the payment contingent on future profits.

"It really will have no appreciable impact on our financial ability," he said. "We are absolutely pleased that it's over."

Unisys attorney Charles Ruff entered the guilty plea before U.S. District Judge Claude Hilton in the Washington suburb of Alexandria.

Barr said the $190 million includes $162 million in civil damages and penalties, $18 million in civil forfeitures which will go to a Justice Department fund for use in law enforcement, $5 million in criminal fines and $5 million for reimbursement of investigative costs.

Unisys will pay $54 million in cash over five years, starting with a payment of $6.3 million this year. It will pay an estimated $46 million from profits on a radar surveillance system contract that is scheduled to be completed in late 1994, and contingency payments of up to $90 million made through 1997 depending on the asset sales and net income reported by Unisys over that period.

Unisys pleaded guilty to eight counts, including conspiring to defraud the United States, bribery, conversion of government property and filing false statements. Among the counts were related charges of defense procurement fraud pending against Unisys in Brooklyn, N.Y., Albuquerque, N.M., and Corpus Christi, Texas.

It pleaded guilty to bribing former Assistant Secretary of the Navy [**Melvyn Robert Paisley (born 1924)**], former Deputy Assistant Secretary of the Air Force Victor D. Cohen and another Navy official, all of whom were previously convicted on related charges.

Barr said Unisys is the sixth corporation to plead guilty to charges stemming from the four-year-old Operation Ill Wind investigation, with total settlements in fines and penalties reaching $225 million. It was the 51st conviction, Barr said, in cases also against defense consultants, businessmen and government officials.

Five defense contractors have pleaded guilty to a variety of criminal charges stemming from their efforts to illegally obtain confidential bid information submitted to the Pentagon by competitors

Defense firms hired former Pentagon officials as consultants to use their contacts still in government to obtain the information that the companies hoped to use to tailor their own bids to obtain lucrative military contracts.

Defense subsidiaries of Unisys played a major part in the scandal.

More than a dozen former Unisys executives or consultants have pleaded guilty to various charges and are cooperating with the investigation.

Among those cooperating with the investigation are Charles F. Gardner, a former Unisys vice president who admitted creating a slush fund to bribe government officials and make illegal campaign contributions.

Among other things, Gardner admitted arranging for Unisys to purchase at an inflated price Paisley's resort condominium.

[**Melvyn Robert Paisley (born 1924)**] pleaded guilty to bribery charges in June, admitting that he helped manipulate one bidding competition to help Sperry obtain a share of a lucrative weapons contract.

When Paisley left the Pentagon in 1987, Unisys hired him as a consultant and within a month paid him $98,000, according to court papers.

Unisys, based in Blue Bell, Pa., is trying to reduce its debt of $3.8 billion by selling certain assets, including its defense division. Industry analysts say this sale has awaited the settlement of the charges.

Last year, Unisys lost $437 million on revenue of $10 billion, including $2 billion in revenue from its defense operations. [...]

1991 (Aug 23) - LA Times - "Ex-Official Enters 'Ill Wind' Guilty Plea : Defense: It marks the 50th conviction obtained under the probe of Pentagon procurement fraud. He faces 20 years in jail at sentencing Dec. 6."

https://www.latimes.com/archives/la-xpm-1991-08-23-mn-1071-story.html

By ROBERT L. JACKSON

WASHINGTON — A former high-ranking Air Force official pleaded guilty Thursday to accepting bribes and conspiring to defraud the government in the Operation Ill Wind investigation of Pentagon procurement fraud.

Acting Atty. Gen. William P. Barr said the guilty plea by Victor D. Cohen was the 50th conviction obtained under the Ill Wind probe, which has been handled by the Naval Investigative Service, the FBI and the U.S. attorney's office in Alexandria, Va.

Cohen, who was deputy assistant Air Force secretary, faces a maximum penalty of up to 20 years in prison and fines of up to $500,000. He will be sentenced on Dec. 6 by U.S. District Judge Claude M. Hilton. His plea agreement with the government requires Cohen to "cooperate fully" with authorities in prosecuting others.

Cohen, 55, is the second-highest former Pentagon official to plead guilty in the scandal. He was outranked only by Melvin R. Paisley, a former assistant secretary of the Navy, who pleaded guilty to similar charges in June.

Court papers stated that Cohen, in return for favors, payments and the promise of additional funds, "improperly influenced procurement decisions" and provided "sensitive information" to selected companies to help them obtain Pentagon contracts.

Assistant U.S. Atty. Joseph Aronica said he could not estimate the dollar value of Cohen's bribe-taking because it included all-expense-paid overseas trips financed by defense contractors and the promise of additional funds that never were received. At one point, Cohen opened a Swiss bank account to receive illicit payments, but no funds ever reached it, Aronica said.

Documents filed by Aronica showed that Cohen dealt mainly with William M. Galvin, a private consultant who pleaded guilty to bribery and corruption charges last year. Working on behalf of Loral Electronics Corp. of Yonkers, N.Y., one of Galvin's clients, the two men "agreed that Galvin would make a financial arrangement with Loral for Cohen's assistance from which they would both benefit," court papers said.

Loral has paid $5.7 million in fines and civil penalties for its role in the scandal

Cohen also received bribes from Charles F. Gardner, an employee of Sperry and its successor, Unisys Corp., the papers said. Unisys is expected to enter a guilty plea in the next few weeks and pay heavy fines, according to sources familiar with the case.

Describing one episode, court papers said, Gardner had called Galvin in May, 1987, and reported that Cohen "told him that Unisys had been awarded a $482,000 contract."

"Gardner joked that it had cost the company one and a half million dollars to win a half-million dollar contract, but he then stated that it was the start of $9 million," the papers said.

Among the favors received by Cohen were London theater tickets, payment of a $1,166 Paris hotel bill and the purchase of his 1979 Mercedes Benz for $17,800, a car that a Unisys executive later repaired and resold for only $4,225.

So far, 45 individuals and five corporations have been convicted in Ill Wind, an investigation that became public in June, 1988, when federal agents served four dozen search warrants at homes and offices across the nation. Officials said the probe actually had begun secretly in 1986 with a tip from a former Marine Corps official.

1993 (Jan 11) - Fortune Magazine - "INSIDE THE BIGGEST PENTAGON SCAM An extraordinary federal investigation called Operation Ill Wind reveals how secrets are sold, bids are rigged, and officials are bribed. Can Clinton stop the fraud?"

Source : [HP004J][GDrive]

By Irwin Ross REPORTER ASSOCIATE Wilton Woods IRWIN ROSS, a longtime contributor to FORTUNE, is author of Shady Business, a study of corporate corruption undertaken for the Twentieth Century Fund.

(FORTUNE Magazine) – Voters loved it when Ross Perot thundered against a government corrupted and betrayed by lobbyists and consultants sporting "alligator shoes and $1,000 suits." Now Bill Clinton vows to crack down on influence peddling by former bureaucrats and to impose the strictest ethics requirements ever on officials who serve in his Administration. Well, Mr. President-elect, good luck. You'll need it.

Now meet the reason. His name is [**Melvyn Robert Paisley (born 1924)**], and for more than five years during Ronald Reagan's presidency, he served as an Assistant Secretary of the Navy with major responsibility for procurement. No one more brazenly exploited Washington's infamous "revolving door" than Paisley. According to the government, in the first 15 months after he left the Pentagon in March 1987, Paisley collected more than $500,000 in consulting fees from companies he had earlier befriended. Even worse, while in office, he corrupted the bidding process on hundreds of millions of dollars of weapons systems in order to divert contracts to those who secretly bought his services.

The scams that swirled around Paisley were brought to light -- and eventually to justice -- as part of **Operation Ill Wind**, the biggest and most successful federal investigation ever of defense procurement fraud. Since it was launched in September 1986, Ill Wind has led to the conviction of nine government officials, 42 Washington consultants and corporate executives, and seven companies. The best known are United Technologies, the seventh-largest defense contractor; Unisys, the 15th largest; Loral Corp., No. 16; and Teledyne, No. 37. [...]

Unisys agreed to pay the biggest total penalty -- $163 million in fines, damages, and forfeitures, plus the cost of its investigation. Just recently, John O'Brien, former chairman of Grumman and the highest executive nailed so far, pleaded guilty to two counts of fraud in a case related to Ill Wind. Though two trials are still pending, the investigation is finally winding down, and the full story of what was uncovered can now be told.

WHY TELL IT?

Ill Wind provides an unparalleled worm's-eye view of exactly how secrets are sold, officials are bribed, bids are rigged, payoffs are hidden, and other favors

Ill Wind provides an unparalleled worm's-eye view of exactly how secrets are sold, officials are bribed, bids are rigged, payoffs are hidden, and other favors are delivered. Such shenanigans naturally tend to cluster where the money is.

During the 1980s, the Pentagon was Washington's biggest honey pot. It will remain so even as it shrinks, but in the 1990s, more honey may flow from a new civilian R&D agency, the Energy Department, or whoever handles the infrastructure buildup Bill Clinton plans. While eliminating such illegal activities is undoubtedly impossible, Ill Wind offers insights into how they may at least be discouraged.

Though this sorry saga features a huge cast of characters, its antihero is clearly [Melvyn Robert Paisley (born 1924)]. No other government official toppled by Ill Wind ranked so high, raked in so much, drew such a stiff sentence (four years in prison), or seemed a more unlikely candidate for corruption. Indeed, until its last chapter, Mel Paisley's life had largely been a classic American success story. He was born on October 9, 1924, in Portland, Oregon, and spent his preschool years in a logging camp on Oregon's Umpqua River. His father worked as a high climber -- the daring fellow who shinnied up the trunk to shear off the top 25 feet. His mother toiled in the cookhouse. When America entered World War II, young Mel enlisted in the Army Air Corps but had to wait a year, until he turned 18, before he could put on a uniform. Trained as a pilot, he flew scores of missions over Europe at the controls of a P-47 fighter, downed several enemy planes, and came home with a chestful of medals, including the Distinguished Service Cross. Mustered out as a captain at age 21, Paisley then earned a bachelor's degree in engineering. After a few months of graduate school at MIT, he was hired by Boeing as a junior engineer. There Paisley flourished for 28 years, rising to international sales manager for a division of Boeing Aerospace. In his last years at the company he found a great friend and admirer in John Lehman, a consultant to Boeing, who became Secretary of the Navy under Ronald Reagan. Less than a year after taking office, Lehman got Paisley named his Assistant Secretary for Research, Engineering, and Systems.

Young, aggressive, controversial, Lehman, then 38, blew into Washington determined to fulfill Reagan's pledge to restore America's military might by expanding the Navy's fleet to 600 ships. As Lehman's point man in that effort, Paisley quickly developed a reputation as a decisive administrator who rapped out orders in a strong, raspy voice and frequently dressed down underlings in the presence of others. His boss's trust in him enhanced Paisley's already significant power. Eighteen months before Ill Wind became public, Lehman declared that Paisley had been his first choice for the job and had turned out to be "the best Assistant Secretary for Research and Development the Navy has ever had." (Lehman, who was never implicated in any wrongdoing and is now a managing director at Paine Webber, refused to talk to FORTUNE about either Paisley or Ill Wind. Paisley, now serving time at a minimum security federal prison near Las Vegas, also refused to be interviewed.)

During all these years, the only hint of scandal to color Paisley's reputation was his turbulent domestic life. **The most bizarre incident was the death in 1968 of his second wife, Mary Lou. Paisley told Seattle police that he awoke in the middle of the night to find her body on a bathroom floor, her head facedown in a towel soaked with carbon tetrachloride, with which she had apparently cleaned brushes that she used for her oil paintings. Paisley also reported that she had imbibed some alcohol before retiring and taken two sleeping pills.** Her death was ruled an accident, a finding left unchanged when local authorities, prompted by the Ill Wind revelations, opened a new investigation 20 years later. Soon after Mary Lou's death, Paisley wed his secretary at Boeing. That union ended in divorce shortly before he married Vicki McKim, a Boeing computer analyst many years his junior, in 1980. When did Paisley cross the line from bullying bureaucrat to crook? And why? The many lengthy documents filed in court when Paisley and other defendants pleaded guilty (and which provided much of our chronology) offer no way to pinpoint the debut of his illegal activity. But money was clearly the motive. Paisley took a pay cut when he left Boeing, a loss he apparently felt was only partly assuaged by a $183,000 severance payment that his former employer granted him when he resigned. Defense consultant William M. Galvin was Paisley's partner in his felonious schemes. They met at Paisley's swearing-in festivities in December 1981. Galvin invited the Navy's Mr. Procurement to his home for a Christmas tree trimming party later that day. A large, barrel-chested man whose heartiness and gregariousness would typecast him as a salesman in any setting, Galvin had little technical competence in defense matters but a vast talent at parlaying friendships into business and bestowing favors large and small. He entertained lavishly at his 17-acre estate in Front Royal, Virginia. Unlike other consultants, Galvin had never worked at the Pentagon, but he had impressive clients, among them Unisys, Loral, Martin Marietta, and United Technologies. The first documented deal between Galvin and Paisley occurred in December 1985. On Christmas Eve, the two flew to St. Thomas in the Virgin Islands on vacation. There they hatched a complicated scheme to get the Navy to select Martin Marietta as prime contractor on a research program whose identity still remains classified. They also agreed to form a company, called Sapphire Systems, that would become a subcontractor on the program, though Paisley's financial interest in it would naturally remain concealed. Sapphire didn't take long to shine. On April 5, 1986, Paisley and Galvin met in New York City with an individual identified by the government only as "a high corporate official of Martin Marietta (now retired)" to discuss strategy for obtaining the prime contract. Paisley suggested that the company retain Galvin as a consultant, which it did. Seven months later Paisley formally named Martin Marietta the prime contractor, irately overriding a Navy official who questioned the arrangement. By the end of the month, initial funding for the project had been approved, with $900,000 to go to Marietta and $300,000 to Sapphire. Things were looking so bright that at one point Galvin proposed that Marietta buy Sapphire at some future date for $5 million. In the end, however, the whole scheme disintegrated. Once Paisley resigned from the Pentagon in 1987, the Navy dropped Marietta and signed up another prime contractor. Still, Paisley's Martin Marietta connection served him well. Several months after he swept through the revolving door, the company, at Galvin's urging, hired him as a consultant. By the time Ill Wind became public in June 1988, Martin Marietta had paid him some $200,000. (The company, which cooperated with the Ill Wind investigation, has not been charged with any wrongdoing.) Paisley was more successful in the illegal chores that he undertook in 1986 on behalf of Sperry Corp., which merged with Burroughs that November to form Unisys. Sperry was bidding to supply the Navy an airport surveillance radar system. When Sperry's "best and final offer" (known in the trade as a BAFO) proved too high, Paisley blocked the contract award to a competing company. He then went to extraordinary lengths to persuade his Pentagon colleagues to alter the terms of the competition in ways that would favor Sperry. He later passed to Galvin information on a rival's bid. With this illegal edge, Sperry ! easily came in as low bidder in the second round of BAFOs and won the contract for $45 million. AROUND THIS TIME Paisley learned that Sperry was also doing poorly in a competition to make the radar transmitter for the Aegis weapons system installed on some destroyers and small cruisers. Ever mindful of the company's interest, he arranged a meeting at his home on a Saturday in May, with Galvin, a Sperry engineer, and Charles F. Gardner, a Sperry vice president. After a long discussion of various strategies, Paisley came up with the solution: Sperry's best bet was to team up with Westinghouse and bid for the contract together. Back in the Pentagon, Paisley once again rearranged the playing field to favor his friends. RCA and its subcontractors, which originated the Aegis program, were already the primary source. That left open the role of additional suppliers. Rather than continuing to take rival bids for different components of the system, Paisley declared that two teams of two companies each would compete to be the second source for the entire system. To eliminate potential rivals, Paisley drastically shortened the period in which bids could be received. In June 1987, Sperry and Westinghouse (an innocent in the whole affair) were awarded the contract. Favors like these prompted Gardner to become one of Paisley's principal paymasters. An old Washington hand, Gardner was general manager of Sperry's surveillance and fire control systems division, headquartered in Great Neck, Long Island. That position gave him a convenient way to covertly finance -- apparently without the knowledge of his corporate superiors -- a steady stream of bribes, favors, and illegal political contributions. He did so by arranging for "technical services" contracts with outside parties, ostensibly for things like special reports. Though he had authority to spend up to $1 million per contract, Gardner avoided auditors' scrutiny by limiting them to $100,000 each. To provide conduits for the payments, Gardner arranged for James G. Neal, one of the many consultants he used, to set up shell corporations. Neal obliged with a dazzling display of letterheads -- James Neal

Associates Inc., Anchorage International of Northern Virginia Inc., Orion Tech Inc., Tech Plans Inc., Polaris Tech Inc., Jay Dee Tech Inc., and Dubhe Associates. All these entities received consulting contracts from Sperry. Neal also set up another corporation, Daltech Inc., which served as a channel to transmit funds received by Neal back to Gardner. In the end the bill for all these ill-gotten gains was normally picked up by the government, since Sperry added consultants' fees to either its direct or its overhead costs on military contracts. In August 1986, Gardner used Neal's network of companies to buy a condominium in Sun Valley, Idaho, from Paisley for $149,000, well above its market value. Indeed, 15 months later, Gardner and Neal resold the condo for only $100,000. Government investigators claimed that the difference between the two prices was a bribe, a charge to which Gardner later pleaded guilty. After Paisley left the Pentagon, Unisys fulfilled a promise that Gardner had previously made and employed him as a consultant, paying him $98,000 from May 1, 1987, to May 14, 1988. Though most of the favors Paisley delivered earned him relatively small change while he was in office, one scheme might have produced a major payoff -- if only it had worked. It involved an effort to get a lucrative Navy contract for an Israeli company called Mazlat, which was teamed with an American company, AAI. In 1985, Mazlat/AAI won a Navy contract for a system of short-range, unmanned planes used to gather combat intelligence and known as RPVs (remotely piloted vehicles). Subsequently, the Navy announced a competition for a medium-range RPV system. Mazlat/AAI sought to supply one component -- the equipment that monitors the pilotless craft -- and planned to offer the same ground control mechanism that it used on its short-range system. In March 1986, Galvin hosted a breakfast at his home for Paisley, Mazlat's president, and an Israeli consultant. They struck a deal. Paisley would try to influence the Navy to adopt the Mazlat system for the new RPVs, in return for which Mazlat would pay a 2% royalty into a Swiss bank account of Lorena Associates, a company owned by Galvin. The four would share the royalties. Mazlat made a down payment of $50,000 into the Lorena account, and other payments brought the total to around $200,000. Orders for the ground control stations were expected to reach $100 million eventually, which would mean $500,000 for each man. Though pleased with this arrangement, Paisley was unsure how to manage his overseas stash and asked Galvin for advice. "I don't understand how to do it best, to bring some of that money out of Switzerland," he told Galvin in a telephone call the government tapped. Galvin's reply: "Well, I leave it there . . . if you bring it here, you've got to pay the taxes." A good reason to leave it in Switzerland, Paisley concluded. In May he did what he was paid for, issuing a directive that mandated the adoption of the Mazlat ground control system. But over the next two years the scheme fell apart because the Mazlat component performed poorly. (The two Israelis who made the deal have not been indicted, nor has Mazlat.) After Paisley resigned from the Pentagon, he immediately teamed up with his friend Bill Galvin and set to work parlaying insider information into hard cash. At the time one of Galvin's clients, the Pratt & Whitney division of United Technologies, was having trouble getting the Navy to renew its contract to produce the F404 engine, which powered the Navy's Hornet fighter, formally known as the F/A-18. General Electric also manufactured the engine, and Navy procurement officials were making noises that they might give the entire job to GE because Pratt & Whitney's prices were too high. Enter Paisley, who informed Galvin that he had "stolen" some valuable price data involving GE's bid on the F404 engine on his way out the Pentagon door. Soon after Paisley mentioned his helpful theft, Galvin telephoned Eugene J. Tallia, the head of Pratt & Whitney's Washington office, and asked him to hasten over with his "pad and pencil" for some numbers. Galvin sent his car for Tallia, who soon appeared in Galvin's suite in the Watergate office building, where Paisley unburdened himself of the data. (Tallia was never charged with any wrongdoing.) In the weeks that followed, P&W revised its figures to match GE's proposed prices and was rewarded with a contract for 30% of the production needed in 1988, the same percentage it had before. That happy agreement occurred on June 4, 1987. Late that month Paisley was hired by United Technologies as a consultant, and he was paid $218,000 over the following year. Presumably, he could have looked forward to collecting years of such hefty fees from United Technologies, Martin Marietta, Sperry, and his other corporate clients had Operation Ill Wind not cut his consulting career short. WHAT LESSONS does this investigation offer policymakers? The Pentagon has tightened procurement regulations as a result of it. The major change has been to curb the use of multiple "best and final offers" -- an obvious oxymoron and an easy way to fiddle bids. Since August 1988 a contracting officer must get approval from a higher authority before authorizing a second BAFO, and records must be kept of these approvals. More significant has been a tightening of ethical compliance programs among corporations. Unisys has been particularly aggressive in this regard, establishing new channels such as telephone hotlines to encourage whistleblowers. Clinton's proposal to curb the rapidity with which influence can be legally peddled may also help. Currently, the law restrains -- or is supposed to restrain -- a former officeholder from lobbying his own agency for one year. Clinton wants to raise that to five years. But none of these changes do more than make things slightly harder for determined lawbreakers like Paisley and his friends. Can anything else discourage them? While in office, Paisley himself made one drastic, if unlikely, suggestion. Asked by a congressional committee what should be done about corrupt military officials and defense contractors, he replied that "you have to hang them from a tree where everyone can see them." Short of that, Ill Wind should, at least until memory fades, act as a powerful deterrent.

Address:

51 University Street

Seattle, Washington 98101-2936

U.S.A.

Telephone: (206) 587-0430

Fax: (206) 587-0606

Website: www.immunex.com; www.amgen.comWholly Owned Subsidiary of Amgen Inc.

Incorporated: 1981

Employees: 1,618

Sales: $986.8 million (2001)

NAIC: 325414 Biological Product (Except Diagnostic) Manufacturing; 325412 Pharmaceutical Preparation Manufacturing; 533110 Owners & Lessors of Other Non-financial Assets

Company Perspectives:

Immunex is a leading biopharmaceutical company dedicated to developing immune system science to protect human health. Applying our scientific expertise in the field of immunology, cytokine biology, vascular biology, antibody-based therapeutics and small molecule research, we work to discover new targets and new therapeutics for treating rheumatoid arthritis, or RA, asthma, and other inflammatory diseases, as well as cancer and cardiovascular diseases.

Key Dates:

1981:

Steven Gillis and Christopher Henney found Immunex in Seattle.

1987:

First clinical studies of Leukine are initiated.

1991:

Leukine is marketed for bone marrow transplant patients and receives FDA approval; ground is broken for a new pharmaceutical manufacturing facility in Bothell, Washington.

1993:

Shareholders approve merger with Lederle, a division of American Cyanamid; plans are announced for new research and development center.

1994:

American Home Products buys American Cyanamid; Edward Fritzky joins Immunex.

1996:

FDA approves Novantrone for use in hormone-refractory prostate cancer patients; scientists discover RANK, a molecule involved in the regulation of bone formation/degradation.

1997:

Immunex partners with Wyeth-Ayerst Pharmaceuticals to market Enbrel in North America.

1998:

Researchers clone TACE, a key immune system enzyme, and TRAIL, a gene critical to healthy immune systems; Enbrel receives FDA approval as first in a new class of drugs for treatment of moderate to severe rheumatoid arthritis.

1999:

Immunex stock splits two-for-one; Enbrel is approved for treatment of juvenile rheumatoid arthritis; total product sales reach $376 million and construction starts on new process development facility.

2000:

Immunex stock splits three-for-one; Novantrone is approved by FDA for treatment of worsening multiple sclerosis.

2001:

Enbrel is approved by the FDA for psoriatic arthritis and shows positive results in psoriasis trials; Immunex acquisition by Amgen is announced.

2002:

Immunex is acquired by Amgen Inc.

Company History:

Immunex Corporation is a biopharmaceutical company that develops, manufacturers, and markets therapeutic products for the treatment of cancer, infectious diseases, and autoimmune disorders. The company more than doubled its revenue base between 1992 and 1993 as a result of a merger with Lederle pharmaceutical units of American Cyanamid Company. However, in the mid-1990s, Immunex was still trying to achieve profitability after investing heavily in research and development since its inception in 1981. Immunex is best associated with the development of products such as Enbrel, used in the treatment of rheumatoid arthritis; Novantrone, used to treat acute nonlymphocytic leukemia and pain associated with prostate cancer; and Leukine, for use in bone marrow transplant patients. In July 2002, Immunex was bought by Amgen Inc., the world's largest biotechnology company.

Immunex Founded by Scientists Gillis and Henney

Immunex was formed during the start of the biotechnology craze of the early 1980s. Biotechnology, as it was known in the mid-1990s, was born in the early 1950s, when the structure of DNA was discovered; that revelation lead to the understanding of the process by which proteins are formed. Subsequent breakthroughs, particularly in the early 1970s, showed that it was possible to genetically alter microorganisms and, importantly, produce mass amounts of proteins that naturally occurred only in small quantities. A handful of companies pioneered the commercial biotechnology industry during the middle and late 1970s, but it was not until the early 1980s that a horde of competitors jumped into the game. The pivotal turning point came when the U.S. Supreme Court ruled that genetically engineered bacterium could be patented. For many, that ruling suggested the possibility of fantastic profits for biotech innovators.

Eager to make their mark in the burgeoning commercial biotechnology industry were scientists Steven Gillis and Christopher Henney. Henney, a Ph. D., was internationally recognized for his research in immunology. Gillis also had a doctorate--in biological sciences from Dartmouth College--and was recognized for his contributions related to immunology research. Gillis and Henney believed that they possessed the expertise to develop a method of producing large quantities of certain hormones that showed promise in fighting infection. At the urging of Seattle patent attorney Jim Uhlir, they formed Immunex as a means of developing and commercializing their techniques and drugs.

Joining the duo was Steve Duzan, an entrepreneur who owned an industrial ice-making machine business at the time. Duzan had become intrigued by the emerging biotechnology industry after being introduced to Gillis and Henney. Although prior to joining their startup effort, Duzan had virtually no experience in medical-related industries and did know how to raise investment capital. He was, however, known as a tenacious, hard-driving manager. At the age of 34, Duzan had arranged the leveraged buyout of the Washington-based Cello Bag Co. Inc. Then, in 1980, he engineered the sale of the company to ARCO Chemicals, Inc. He used cash from that deal to purchase North Star Ice Equipment Corp., a small manufacturer of ice-making machines that exported much of its output to the Middle East. Duzan overhauled that company's manufacturing operations and managed to improve its profitability.

Duzan was looking for another company to buy when he met Gillis and Henney. Instead, he helped them to form a completely new company called Immunex. Gillis and Henney, naturally, managed the scientific side of the business, while Duzan went to work finding capital to fund Immunex's cash-hungry research and development operations. As it turned out, many of the entrepreneurial skills that Duzan had learned in his previous business exploits were well suited to the seat-of-the-pants biotechnology sector. For the first six months, Duzan worked without a salary while he scrambled to secure investors. "Immunex was the penniless new kid on the block going up against these giants like Hoffman-LaRoche and Kodak," recalled Stephen Graham, an attorney at Immunex's law firm, in a July 21, 1991 Business Journal-Portland article. "But time and time again," he added, "when Steve looked at a transaction with those people, he would decide what a relatively little guy had a right to expect. And then he would double it. And then he would go out and get it."

While Duzan labored to find cash to fuel Immunex's product development engine, Gillis and Henney oversaw an ambitious research effort to generate various immune system stimulants and related technologies. Their goal was to develop a breakthrough drug, or drugs, that would allow Immunex to become

a full-fledged pharmaceutical company that developed and manufactured its own products. But, that pivotal product proved elusive for Immunex's research team. The company's pursuits did succeed, however, in producing a number of valuable technologies and products that earned the company respect in the biotechnology industry. Specifically, Immunex discovered and cloned a long list of genes producing substances that could work in the human body to stimulate various blood cells to fight cancer, heal wounds, and prevent auto-immune diseases like arthritis and diabetes.

Immunex Introduces Leukine

Among Immunex's most important products during the mid-1980s were its Interleukin drugs and GM-CSF (Granulocyte Macrophage Colony Stimulating Factor). Those products were essentially immune system proteins that acted as hormones in the body, with each hormone commanding only specific types of cells. Each class of cells could be stimulated to respond with antibodies, enzymes, and other substances that multiplied and attacked infection. For example, Immunex's centerpiece drug, GM-CSF (marketed as Leukine), was a blood-growth stimulator that enhanced the body's production of white blood cells. Leukine could fight infection in cancer patients whose white blood cells had been destroyed during bone marrow transplants. It also had potential applications related to chemotherapy.

Although Immunex was at the technological forefront in its niche, the company faced numerous roadblocks to success. Chief among its hurdles was the Food and Drug Administration (FDA) drug approval process. To shepherd a drug through the intimidating FDA gamut, a company typically had to invest millions of dollars completing its own tests and striving to comply with Federal regulations. The obvious risk was that the drug would fail to meet FDA approval and the company would be stuck with the loss. For a smaller company like Immunex, failure could be virtually devastating. To help bring their drugs and technologies to market, therefore, many biotech startups sought other avenues to profit. Common routes included selling or licensing proprietary technology to large pharmaceutical companies, or partnering with bigger competitors to develop and market new drugs.

Immunex managed to stay solvent and continued to fund its research and development arm during the 1980s, in essence by selling its technology to companies that had the financial backing to take it to market. Some analysts criticized the strategy because it effectively turned Immunex into a "research boutique" and represented a diversion from the company's goal of becoming a true pharmaceutical company that marketed its own drugs. But, the tactic was necessary to keep the company afloat given the volatile environment of the biotechnology industry. A critical juncture for the company came in 1983, shortly after the company had gone public to raise cash through an initial public stock offering. For no apparent reason related to Immunex's performance, the company's stock price plunged from $11 to $4. The price remained suppressed while biotech investors questioned the viability of the entire industry.

Unable to generate acceptable proceeds from the sale of more stock, Duzan arranged a number of deals that benefited Immunex. He negotiated with some large American and European drug companies, selling marketing and manufacturing rights to most of the major immune-system stimulants that it had cloned. Those agreements included high-profile products like GM-CSF and its Interleukin drugs. Although forfeiting company rights to some of that technology, Duzan was credited with swinging deals that, in the long term, worked in Immunex's favor. For example, in selling marketing rights for GM-CSF to German pharmaceutical manufacturer Behringwerke AG, Duzan won a concession to oversee clinical trials for Leukine. That move later made it possible for Immunex to become a true pharmaceutical company, rather than just a research lab that collected royalties from its inventions.

Throughout the 1980s, Immunex developed a number of promising technologies, most of which it sold or licensed to other companies. As fees and royalties income increased, revenues rose steadily to about $2.4 million in 1985, $11.3 million in 1987, and $23.3 million by 1989. Profits remained elusive, however, as the company continued to pour millions into research and development. Investors had generally been patient with Immunex because the company had been so successful at developing new products. Investor patience gradually wore thin, as they watched the company spend millions without ever successfully taking a drug to market. Immunex managed to post meager profits in 1988 and 1991, but those surpluses were insignificant compared to big losses in other years. Indeed, between 1985 and 1990 Immunex lost nearly $30 million.

Despite ongoing losses, it seemed as though Immunex had turned the corner toward profitability going into the early 1990s. In a series of bold and complex deals initiated in 1989, Duzan reacquired, sold, and swapped the rights to a number of its drugs. The end result was that Immunex, by 1990, was in a position to possibly begin marketing its own technology. "In this business you've got to become a marketing organization," Duzan said in a April 15, 1990, Seattle Times article. "Because that's the only way you can get enough cash flow to sustain your research." The most significant result of Duzan's wheeling and dealing was that Immunex managed to reacquire the U.S. comarketing rights to GM-CSF and certain Interleukin drugs from its German partner Behringwerke AG. The move was risky because GM-CSF had not been approved for use in the United States by the FDA.

Immunex Receives FDA Approval for Leukine

Investors finally had something to cheer about when, in March 1991, Immunex won FDA approval to market Leukine (GM-CSF) in the United States to treat bone marrow transplant patients. The company's shares rocketed to a record high of $59 following the announcement, and Immunex initiated an aggressive marketing program to sell the product. Shortly after the approval, Immunex was selling Leukine through a 50-member sales team organized to market the product to oncology specialists. At the same time, Immunex continued to invest millions of dollars into new drugs. Chief among its research projects in the early 1990s was Pixie 321, a synthetic molecule that was designed to incorporate the properties of Leukine and Immunex's Interleukin 3 (a cancer-fighting compound). Duzan hoped to sell that and other drugs through its own sales force.

Despite notable successes during the late 1980s and early 1990s, Immunex continued to disappoint some analysts and investors. The company chalked up heavy losses, largely related to research expenses, totaling $78 million in 1992. The company had hoped to offset that deficit with increased sales of Leukine, but its marketing effort failed to live up to some analysts' hopes. The problem was partially attributable to a product similar to Leukine that was introduced by competitor Amgen. Amgen received approval for its drug, Neupogen, in 1992. Whereas Leukine had been approved for the bone marrow transplant market, Neupogen was approved for use in the much larger chemotherapy market. The result was that shipments of Neupogen bolted to $290 million in 1993, while revenues from Leukine topped out at less than $23 million. "One company operates in an ocean, the other in a pond," surmised Deborah Wardwell, a Seattle stock analyst, in the August 8, 1994, Seattle Times.

Immunex Bought Out by American Cyanamid

Encountering a fate similar to that experienced by many other biotech companies, Immunex was bought out. In June 1993, American Cyanamid purchased the company and merged it with its Lederle Oncology unit to form a new, publicly traded company still known as Immunex, and headquartered in Seattle. Lederle Oncology was a leader in the immunology industry and had about a half dozen proprietary products in its drug portfolio. Lederle, with its more established marketing network, seemed like a natural complement to Immunex's powerful research operations. The merger initially failed to produce the desired results, however, because Lederle's products did not sell as well as expected. That problem, combined with less-than-stellar gains with Leukine, created investor disappointment with Immunex. The stock price slipped to $30 before dropping to less than $15 per share in 1994.

Frustrated, American Cyanamid brought in a new chief executive to replace Duzan, who had been accused of alienating Wall Street with his brusque nature and questionable management decisions regarding Leukine. Specifically, he had been criticized for allowing Amgen to steal more than 90 percent of the market for Leukine. Gillis, who was an Immunex co-founder and heading up Immunex's research operations at the time, stepped in as a temporary president and CEO for a few months until American Cyanamid appointed Edward Fritzky to the position. (Cofounder Henney had left Immunex in 1989 to start his own consulting company.) Fritzky came to Immunex from American Cyanmid's Lederle Laboratories division where had overseen the launch of six new products in that division and, at the age of 45, was considered a seasoned veteran in the pharmaceutical industry.

American Cyanamid Bought Out by American Home Products

Interestingly, American Cyanamid was bought out by American Home Products (AHP) in mid-1994, making the latter company the majority owner of Immunex. Fritzky remained president and CEO of the company, however, and sustained his efforts to turn Immunex into a development and marketing powerhouse in its pharmaceutical niche. Unfortunately, profits continued to evade Immunex going into the mid-1990s, amidst a string of setbacks. In September 1994, for example, cofounder Steve Gillis resigned his post to pursue other research goals. More importantly, the FDA refused to approve Leukine for use in the $500 million chemotherapy market that was dominated by Amgen. The stunning news sent Immunex's stock price tumbling 20 percent to less than $13 per share by May 1995. Nevertheless, management remained optimistic, given the company's proven research capabilities, pipeline of high-potential drugs, and ongoing efforts to get FDA approval to use Leukine in chemotherapy applications.

Despite setbacks, Immunex continued to strengthen its oncology franchise operations and apply understanding of immune system science beyond cancer care and into infectious and inflammatory diseases. Studies continued on new indications for Leukine and the chemotherapeutic Novantrone, shown to benefit men with hormone refractory prostate cancer. Also in 1995, Immunex marked a milestone in the battle against rheumatoid arthritis, with a clinical study of a recombinant TNF (tumor necrosis factor) receptor that proved to neutralize TNF's ability to promote inflammation, resulting in improvement in swollen and painful joints.

Immunex Introduces Enbrel

The company's financial outlook improved in 1995 and 1996 through research efforts, the franchising of existing products, and development of a broader marketing focus. In 1996, the FDA approved a new claim for Novantrone for relieving pain in late-stage prostate cancer patients, and Leukine Liquid, a white blood cell stimulant available in a multidose vial. With revenue growth from the increased sales of these products, research continued on the TNF receptor, brand named Enbrel. Other products in the development pipeline included FLT-3 ligand, affecting transplant patients; CD40 ligand, a potential candidate for the treatment of cancer and infection; and other cancer and inflammation fighting products, including TRAIL and TACE, respectively. Wyeth-Ayerst, a division of AHP, and a leader in the anti-inflammatory market, came on board to assist with investing in and marketing Enbrel. The research agreement with AHP was restructured which allowed Immunex fewer investment concerns in discovery research, and a new senior vice president position of marketing was added. These developments enabled Immunex to "transition from a biotechnology research firm with a few pharmaceutical products into a pharmaceutical enterprise dedicated to the research and development of innovative new therapeutics." The company hoped to profit from a strong market awareness and aggressive commercialization of its products.

The year 1997 was seen as a breakthrough year for Immunex. In its race to become the first to market a successful rheumatoid arthritis therapy, Immunex continued clinical trials on Enbrel. A new indication for Novantrone was also launched for treating patients suffering from prostate cancer. Record sales of Novantrone and Leukine were reached. In the area of research, promising biological therapeutic candidates, Nuvance for asthma sufferers and Mobist, an anti-tumor therapy, were introduced. As a result of increased pressure for faster development of emerging technologies and intense competition in the pharmaceutical business, Immunex formed alliances with Digital Gene Technologies, Inc., a genomics company, and American Oncology Resources, a network of U.S. oncologists.

Enbrel Receives FDA Approval

Another breakthrough year followed in 1998, with the FDA's approval of Enbrel for treatment of moderate to severe rheumatoid arthritis in patients with inadequate response to existing therapies, thus making Enbrel the first in a new class of rheumatoid arthritis drugs. Sales of Enbrel alone reached nearly $13 million in the first weeks of marketing. Expanding the potential uses for other drugs, Immunex introduced research describing the potential for Novantrone for treating patients with progressive multiple sclerosis (MS). Leukine was being evaluated for its ability to treat patients with HIV/AIDS; and Enbrel was being studied for treatment of chronic heart failure. Studies continued on Nuvance, for asthma sufferers; and Mobist and CD40 ligand, for use in cancer treatment.

With product success came financial success: total product sales reached a record $170 million for the year; sales of cancer products grew to record levels as well, lead by Leukine with a 21 percent increase over the previous year. Cash reserves at year-end reached $145 million. Immunex restructured a strategic alliance with AHP, giving AHP options to select and develop certain products and returning to Immunex worldwide rights to certain cancer products. A new consumer campaign was launched, called Enliven, to assist new patients through their initial therapy on Enbrel. A new Web site was launched, www.enbrelinfolcom, providing reimbursement assistance and customer service for patients and providers. Through alliances with ArQule, Genetics Institute, Digital Gene Technologies, and Medarex, Immunex enhanced their product growth and development capabilities.

Enbrel continued to spell success in 1999, with $367 million in U.S. sales. Two stock splits were declared in 1999: two-for-one splits in March and August. Having previously been accepted in the adult rheumatoid arthritis market, Enbrel became the first FDA-approved therapy for juvenile rheumatoid arthritis as well. Additional research was conducted in expanding the uses of Enbrel for the treatment of psoriatic arthritis and chronic heart failure. In oncology treatments, studies continued on Leukine, Mobista, and CD40 ligand, brand-named Avrend. An alliance was announced with Genentech, Inc., to jointly develop TRAIL, found to suppress and reverse tumor growth.

Construction began on a new 50,000-square-foot process development facility located in Bothell, Washington. In partnership with Wyeth-Ayerst, renovations began on a commercial-scale biologics manufacturing plant in Rhode Island; and plans were underway for a new research and technology center in Seattle, called the Helix Project, to house a world-class collaborative team in the field of immune system science.

Marketed products in 2000 included two major therapeutic classes: anti-inflammatory (Enbrel) and specialty therapeutics (Leukine, Novantrone, Thioplex, Amicar, Methotrexate sodium injectable, and Leucovorin calcium). Revenues from sales of Enbrel reached $652.4 million, approximately 76 percent of the company's total revenue for the year. In anticipation of increasing demands for Enbrel, a program was initiated to help insure uninterrupted therapy for U.S. patients. The Enbrel enrollment program called for patients who were prescribed Enbrel before January 1, 2001, to register with Immunex and receive an enrollment number, thus insuring their continued supply of the drug.

As of 2001, Leukine had received FDA approval for use in bone marrow transplant therapies for the treatment of leukemia, lymphoma and Hodgkin's disease

As of 2001, Leukine had received FDA approval for use in bone marrow transplant therapies for the treatment of leukemia, lymphoma and Hodgkin's disease and for use in peripheral blood progenitor cell mobilization and post-transplantation support. Novantrone was approved for treatment of certain cancers, including acute nonlymphocytic leukemia; for treating patients with pain associated with hormone refractory prostate cancer; and for treatment in MS.

In the areas of research and development, Immunex continued to focus not only on producing new biological therapeutic candidates, but building pharmaceutical franchises and expanding the commercial usefulness and revenue-producing ability of key products. These included new indications of Enbrel to include therapies for congestive heart failure, psoriatic arthritis, and psoriasis. Leukine was investigated for treatment of malignant melanoma, mucositis, anti-tumor adjuvancy, and HIV/AIDS. Clinical trials continued on Nuvance in asthma therapy; Mobista as an anti-tumor agent; and Avrend in cancer treatment.

The marketing relationship continued with AHP, with Immunex owning the rights to Enbrel in the United States and Canada, and AHP owning the rights to Enbrel in all other countries. As a result, Immunex did not receive royalties or shares of gross profits from sales of Enbrel outside the United States and Canada. Leukine was available to patients only in the United States and marketed through a specialty sales force within Immunex. In June 2000, Immuntex entered into a five-year comprehensive genomics agreement with Celera Genomics. The following month, Immunex entered into a joint development and commercialization agreement for ABX-EGF, a fully human antibody created by Abgenix, Inc., for treatment of tumors, including lung, prostate, pancreatic, colorectal, renal cell, and esophageal. In December, a five-year agreement was reached with Cambridge Antibody Technology (CAT) for the use of CAT's proprietary antibody phage display library for the discovery, development and potential commercialization of human monoclonal antibodies. Other research and development arrangements continued with Genentec and Digital Gene Technologies.

Immunex Sets Records for Sales, Profit and Cash Flow

The business of biotechnology continued to be lucrative for Immunex in 2000. Records for product sales, profit and cash flow were broken from the previous year, and a new record in the financial world was set with the largest healthcare secondary stock offering ever. On March 20, 2000, Immunex effected a three-for-one stock split.

Product sales for 2001 reached $960 million, a 16-percent increase over the previous year's sales. New records were set for sales of Enbrel, with plans to expand manufacturing capacity to keep up with growing demand. For the first time, sales of Leukine exceeded $100 million. In its first full year of sales, Novantrone increased 19 percent from the previous year. Immunex was added to the S&P 500, and Fortune magazine recognized the company as the eighth "Fastest Growing Company in America" and one of the "100 Best Companies to Work for in America."

In expanding technologies, Enbrel received FDA approval for psoriatic arthritis and trials continued for the treatment of psoriasis; ankylosing spondylitis, an inflammatory disease of the spine; and Wegener's granulomatosis, an inflammatory disease of blood vessels. Biotechnology manufacturing capabilities were expanded through the acquisition of the Rhode Island manufacturing plant from AHP, with FDA approval expected in 2002.

Three new product candidates entered "transition" status, the stage in which clinical development commences within 12 to 18 months: RANK, a bone resorption inhibitor for use in cancer and osteoporosis treatment; TEK, an anti-angiogenesis factor for use in cancer treatment, and Anti-IL-4R, an antibody for asthma therapy. Two new products in clinical development included IL-1 for treatment of inflammatory disease and ABX-EGF, codeveloped with Abgenix for inhibiting the growth of cancerous tumors.

Immunex Announces Plans to Merge with Amgen

On December 17, 2001, Immunex announced an agreement and plan to merge with Amgen Inc. and AMS Acquisition, Inc., a wholly owned subsidiary of Amgen. The total Immunex price tag would be $16 billion. Under terms of the agreement, AMS Acquistion Inc. would be merged with and into Immunex, with Immunex becoming a wholly owned subsidiary of Amgen. Each share of Immunex common stock would be exchanged for a fixed ration of 0.44 shares of Amgen common stock and cash of $4.50. Amgen would also acquire AHP's 41 percent stake in Immunex for the same purchase price per share. The price would give AHP an 8 percent stake in the new company. According to Immunex Chairman Fritzky, "The proposed integration of Immunex into Amgen would unite two biotech industry pioneers, both of which have delivered on the promise of biotechnology with leading products. The product portfolio, scientific leadership, commercial expertise, and drive for results would create a strong foundation for the new Amgen in its aspiration to become the world's best human therapeutics company."

Representing a key step in accelerating Amgen's long-term growth, on July 16, 2002, the acquisition of Immunex Corporation was complete. According to Kevin Sharer, Amgen's chairman and CEO, "Amgen will now have an enhanced position as the biotechnology leader, with a wide range of important drugs, including proven blockbusters Epogen, Neupogen, and Enbrel." Amgen also acquired key Immunex personnel in the merger. Ed Fritzky, former chairman and CEO of Immunex, became a member of Amgen's board of directors, and Doug Williams, previously Immunex executive vice president and chief technology officer, will lead the Seattle research site. Peggy Phillips, Immunex executive vice president and chief operating officer was expected to serve as a special advisor to Amgen. The integration of Amgen and Immunex produced a new Amgen, the world's largest biotechnology company with an unrivaled portfolio of primo drugs and the marketing muscle to successfully commercialize its products.

Principal Competitors:AstraZeneca; Centocor; Genentech; GlaxoSmithKline; Merck; Roche; Wyeth.

Inslaw, Inc. is a Washington, D.C. based information technology company that markets case management software for corporate and government users.

Inslaw is known for developing Promis, an early case management software system. It is also known for a lawsuit that it brought against the United States Department of Justice in 1986 over Promis. Inslaw won damages in bankruptcy court, but these were overturned on appeal. The suit resulted in several Justice Department internal reviews, two Congressional investigations, the appointment of a special counsel by Attorney General William P. Barr, and a lengthy review of the special counsel's report under Attorney General Janet Reno. Inslaw's claims were finally referred by Congress to the Court of Federal Claims in 1995, and the dispute ended with the Court's ruling against Inslaw in 1998.

During the 12-year long legal proceedings, Inslaw accused the Department of Justice of conspiring to steal its software, attempting to drive it into Chapter 7 liquidation, using the stolen software for covert intelligence operations against foreign governments, and involvement in a murder. These accusations were eventually rejected by the special counsel and the Court of Federal Claims.

History of Inslaw

Inslaw began as a non-profit organization called the Institute for Law and Social Research. The Institute was founded in 1973 by William A. Hamilton to develop case management software for law enforcement office automation.[1] Funded by grants and contracts from the Law Enforcement Assistance Administration (LEAA), the Institute developed a program it called "Promis", an acronym for Prosecutors' Management Information System, for use in law enforcement record keeping and case-monitoring activities.[2] When Congress voted to abolish the LEAA in 1980, Hamilton decided to continue operating as a for-profit corporation and market the software to current and new users. In January 1981 Hamilton established the for-profit Inslaw, transferring the Institute's assets over to the new corporation.[2]

Development of Promis

Promis software was originally written in COBOL for use on mainframe computers; later a version was developed to run on 16 bit mini-computers such as the DEC PDP-11.[3] The primary users of this early version of the software were the United States Attorneys Offices of the District of Columbia, and state

the DEC PDP-11.[3] The primary users of this early version of the software were the United States Attorneys Office of the District of Columbia, and state and local law enforcement.[4] Both the mainframe and 16 bit mini-computer versions of Promis were developed under LEAA contracts, and in later litigation, both Inslaw and DOJ eventually agreed that the early version of Promis was in the public domain, meaning that neither the Institute nor its successor had exclusive rights to it.[5]

The Promis implementation contract

In 1979, the DOJ contracted with the Institute to do a pilot project that installed versions of Promis in four US Attorneys offices; two using the mini-computer version, and the other two a "word-processor" version which the Institute was developing.[2] Encouraged by the results, the Department decided in 1981 to go ahead with a full implementation of locally based Promis systems, and issued a request for proposals (RFP) to install the mini-computer version of Promis in the 20 largest United States Attorneys offices. This contract, usually called the "implementation contract" in later litigation, also included developing and installing "word-processor" versions of Promis at 74 smaller offices.[6] The now for-profit Inslaw responded to the RFP, and in March 1982 was awarded the three year $10m contract by the contracting division, the Executive Office of United States Attorneys (EOUSA).[7]

Contract disputes and Inslaw bankruptcy

The contract did not go smoothly. Disputes between EOUSA and Inslaw began soon after its execution.[7][8] A key dispute over proprietary rights had to be solved by a bi-lateral change to the original contract. (This change, "Modification 12," is discussed below.) EOUSA also determined that Inslaw was in violation of the terms of an "advance payment" clause in the contract. This clause was important to Inslaw's financing and became the subject of months of negotiations.[9] There were also disputes over service fees. During the first year of the contract, the DOJ did not have the hardware to run Promis in any of the offices covered by the contract. As a stopgap measure, Inslaw provided Promis on a time-share basis through a VAX computer in Virginia, allowing the offices to access Promis on the Inslaw VAX through remote terminals, until the needed equipment was installed on-site.[10] EOUSA claimed that Inslaw had overcharged for this service and withheld payments.[11]

The DOJ ultimately acquired Prime computers, and Inslaw began installing Promis on these in the second year of the contract, in August 1983.[12] The "word-processor" Promis installation, however, continued to have problems, and in February 1984 the DOJ cancelled this portion of the contract. Following this cancellation, the financial condition of Inslaw worsened, and the company filed for Chapter 11 bankruptcy in February 1985.[13]

Proprietary rights dispute

The implementation contract called for the installation of the mini-computer version of Promis, plus some later modifications that had also been funded by LEAA contracts and like the mini-computer version were in the public domain.[14] In addition, the contract data rights clause "gave the government unlimited rights in any technical data and computer software delivered under the contract."[15] This presented a potential conflict with Inslaw's plans to market a commercial version of Promis which it called "Promis 82" or "Enhanced Promis." The issue came up early in the implementation contract, but was resolved by an exchange of letters in which DOJ signed off on the issue after Inslaw assured the DOJ that Promis 82 contained "enhancements undertaken by Inslaw at private expense after the cessation of LEAA funding."[16]

The issue arose again in December 1982 when the DOJ invoked its contract rights to request all the PROMIS programs and documentation being provided under the contract.[17] The reason the DOJ gave for this request in later litigation was that it was concerned about Inslaw's financial condition. At that point, DOJ had access to Promis only through the Vax time-sharing arrangement with Inslaw; if Inslaw failed, DOJ would be left without a copy of the software and data it was entitled to under the contract.[18] Inslaw responded in February 1983 that it was willing to provide the computer tapes and documents for Promis, but that the tapes it had were for the Vax version of Promis, and included proprietary enhancements. Before providing the tapes, Inslaw wrote, "Inslaw and the Department of Justice will have to reach an agreement on the inclusion or exclusion" of the features.[19]

The DOJ response to Inslaw was to emphasize that the implementation contract called for a version of PROMIS in which the government had unlimited rights and to ask for information about the enhancements Inslaw claimed as proprietary.[20] Inslaw agreed to provide this information, but noted that it would be difficult to remove the enhancements from the time-sharing version of Promis and offered to provide the Vax version of Promis if the DOJ would agree to limit their distribution.[21] In March 1983, the DOJ again informed Inslaw that the implementation contract required Inslaw to produce software in which the government had unlimited rights, and that delivery of software with restrictions would not satisfy the contract.[22]

Contract revisions

After some back and forth, DOJ contracting officer Peter Videnieks sent a letter proposing a contract modification. Under the modification, in return for the software and data request, DOJ agreed not to disclose or disseminate the material "beyond the Executive Office for United States Attorney and the 94 United States Attorneys' Offices covered by the subject contract, until the data rights of the parties to the contract are resolved."[23] To resolve the data rights issue, the letter proposed that Inslaw identify its claimed proprietary enhancements and demonstrate that the enhancements were developed "at private expense and outside the scope of any government contract."[23] After these were identified, the government would then "either direct Inslaw to delete those enhancements from the versions of PROMIS to be delivered under the contract or negotiate with Inslaw regarding the inclusion of those enhancements in that software."[23] Inslaw eventually agreed to this suggestion, and the change, referred to as "Modification 12," was executed in April 1983. Inslaw then provided DOJ with tapes and documentation for the Vax version of Promis.[24]

Under this arrangement, however, Inslaw had substantial difficulty demonstrating the extent of the enhancements and the use of private funding in their development. It proposed several methods for doing this, but these were rejected by DOJ as inadequate.[25] Inslaw's attempts to identify the proprietary enhancements and their funding ended when it began installing Promis on the USAO Prime computers in August 1983. By the end of the contract in March 1983, it had completed installing Promis in all 20 of the offices specified in the implementation contract. Since none of the available versions of Promis was compatible with the Department's new Prime computers, Inslaw ported the Vax version, which contained Inslaw's claimed enhancements, to the Prime computers.[26]

Inslaw's bankruptcy case

After Inslaw filed for Chapter 11 bankruptcy in February 1985, there were still disputes over implementation contract payments, and as a result the DOJ was listed as one of Inslaw's creditors. At the same time, the DOJ continued its office automation program and, in place of the originally planned "word-processor" version of Promis, it installed the version ported to Prime mini-computers in at least 23 more offices. When Inslaw learned of the installations, it notified EOUSA that this was in violation of Modification 12 and filed a claim for $2.9m, which Inslaw said was the license fees for the software DOJ self-installed.[27] Inslaw also filed claims for services performed during the contract, for a total of $4.1m. The DOJ contracting officer, Peter Videnieks, denied all these claims.[28]

Inslaw appealed the denial of the service fees to the Department of Transportation Board of Contract Appeals (DOTBCA).[29] For the data rights claim, however, Inslaw took a different approach. In June 1986 it filed an adversary hearing in the Bankruptcy Court, claiming that DOJ's actions violated the automatic stay provision of the bankruptcy code by interfering with the company's rights to its software.[27]

Inslaw's initial filing claimed that the contract disputes arose because the DOJ officials who administered the contract were biased against Inslaw.[30] The filing specifically mentioned Promis project manager, C. Madison Brewer, and Associate Attorney General, D. Lowell Jensen. Brewer had previously been Inslaw's general counsel, but according to Inslaw had been terminated for cause. Inslaw claimed that Brewer's dismissal caused him to be unreasonably biased against Inslaw and owner William Hamilton.[31] Jensen was a member of the project oversight committee at the time of the contract. He had helped to develop another competing case management software system several years earlier, and Inslaw claimed that this led him to be prejudiced against Promis, so that he ignored the unreasonable bias of Brewer.[32]

"Independent handling" proceeding

In February 1987, Inslaw requested an "independent handling hearing", to force the DOJ to conduct the adversary hearing "independent of any Department of Justice officials involved in the allegations made" in the hearing.[33] The bankruptcy court judge assigned to handle Inslaw's Chapter 11 proceedings, Judge George F. Bason, granted the request, and scheduled the hearing for June.

Prior to the hearing, Inslaw owners William and Nancy Hamilton spoke to Anthony Pasciuto, then the Deputy Director of the Executive Office of the United States Trustees (EOUST), a DOJ component responsible for overseeing the administration of bankruptcy cases. Pasciuto told the Hamiltons that the Director of the EOUST, Thomas Stanton, had pressured the U.S. Trustee assigned to the Inslaw case, Edward White, to convert Inslaw's bankruptcy from chapter 11 (reorganization of the company), to chapter 7 (liquidation).[33] The Hamiltons had Inslaw's attorneys depose the people whom Pasciuto had named. One of them corroborated part of Pasciuto's claims: Cornelius Blackshear, then a U. S. Trustee in New York, swore in his deposition testimony that he was aware of pressure to convert the bankruptcy.[34] Two days later, however, Blackshear submitted an affidavit recanting his testimony, saying that he had mistakenly recalled an instance of pressure from another case.[34]

Blackshear repeated his retraction at the June hearing on Inslaw's request. Pasciuto also retracted part of his claims at this hearing, and said instead that he did not use the word "conversion." Judge Bason, however, chose to believe the original depositions of Pasciuto and Blackshear, and found that the DOJ, "unlawfully, intentionally and willfully" tried to convert INSLAW's Chapter 11 reorganization case to a Chapter 7 liquidation "without justification and by improper means."[35] In the ruling, Bason was harshly critical of the testimony of several DOJ officials, describing it as "evasive and unbelieveable," or "simply on its face unbelievable."[35] He enjoined the DOJ and the EOUST from contacting anyone in the U.S. Trustee's office handling the Inslaw case except for information requests.[35]

Adversary proceeding

Inslaw's adversary proceeding followed a month after the "independent handling hearing." The proceeding lasted for two and half weeks, from late July to August. In a bench ruling on September 28, Judge Bason found that DOJ project manager Brewer, "believing he had been wrongfully discharged by Mr. Hamilton and INSLAW, developed an intense and abiding hatred for Mr. Hamilton and INSLAW," and had used his position at DOJ to "vent his spleen." He also found that the DOJ "took, converted, stole, INSLAW's enhanced PROMIS by trickery, fraud, and deceit."[36] Specifically, he found that DOJ had used the threat of terminating "advance payments" to get a copy of the enhanced Promis that it was not entitled to, and that it had negotiated modification 12 of the contract in bad faith, never intending to meet its commitment under the modification.[37] In his ruling, Judge Bason again called the testimony of DOJ witnesses "biased", "unbelievable", and "unreliable."[36]

Judge Bason not reappointed

Bankruptcy Court Judge Bason was appointed to the District of Columbia Bankruptcy Court in February 1984 for a four-year term. He sought re-appointment early in 1987, but was informed in December that the Court of Appeals had chosen another candidate. Judge Bason then suggested in a letter to the Court of Appeals that DOJ might have improperly influenced the selection process because of his bench ruling for Inslaw.[38] After learning of this letter, DOJ lawyers moved to recuse Judge Bason from the Inslaw case, but their motion was rejected, and Judge Bason remained on the case until the expiration of his term on February 8, 1988.[38] In early February, Judge Bason filed a lawsuit seeking to prevent the judge the Court of Appeals had selected for the District of Columbia Bankruptcy Court from taking office, but the suit was rejected. Bason's last actions in the case were to file a written ruling on Inslaw's adversary proceeding, and to award damages and attorneys fees to Inslaw.[39]

Appeals of the bankruptcy suit

After Judge Bason left the bench, the Inslaw bankruptcy was assigned to Baltimore bankruptcy judge James Schneider.[40] Schneider accepted Inslaw's reorganization plan at the end of 1988 after a cash infusion from IBM.[41] In the meanwhile, DOJ filed an appeal of Judge Bason's adversary suit ruling in the District of Columbia Circuit Court.[42] In November 1989, Circuit Court Judge William Bryant upheld Bason's ruling. Reviewing the case under the "clear error" standard for reversal, Bryant wrote: "[T]here is convincing, perhaps compelling support for the findings set forth by the bankruptcy court."[43]

DOJ appealed the Circuit Court decision and in May 1991, the Court of Appeals found the DOJ had not violated the automatic stay provisions of the bankruptcy code and that the Bankruptcy Court therefore lacked jurisdiction over Inslaw's claims against DOJ.[44] It vacated the Bankruptcy Court's rulings and dismissed Inslaw's complaint.[45] Inslaw appealed the decision to the Supreme Court, which declined to hear the case.[44]

Federal investigations

Inslaw's allegations against the Justice Department led to a number of investigations, including internal Department probes and Congressional investigations by the Senate's Permanent Subcommittee on Investigations (PSI) and the House Judiciary Committee. The DOJ eventually appointed a special counsel to investigate. After the special counsel issued his report, Inslaw responded with a lengthy rebuttal. The DOJ then re-examined the special counsel's findings, resulting in the release of a final Department review.

During these federal investigations, Inslaw began making allegations of a broad, complex conspiracy to steal Promis, involving many more people and many more claims than the bankruptcy proceedings had covered. These later allegations are described below under the investigations which examined them.

Justice Department investigations

After Judge Bason's June 1987 bench ruling found several DOJ officials' testimony "unbelievable", DOJ's Office of Professional Responsibility (OPR) opened an investigation of DOJ staff who testified at the hearing, including C. Madison Brewer, Peter Videnieks, and EOUST director Thomas Stanton. It also

an investigation of DOJ staff who testified at the hearing, including C. Madison Brewer, Peter Videnieks, and EOUST director Thomas Stanton. It also opened a separate investigation of EOUST deputy director Anthony Pasciuto. OPR recommended Pasciuto be terminated, based on his hearing testimony that he had made false statements to the Hamiltons, but in its final report it found no evidence that the other officials investigated had applied pressure to convert Inslaw's bankruptcy or lied during the independent handling hearing.[46] After Judge Bason issued his written ruling in January 1988, Inslaw's attorneys also complained to the DOJ's Public Integrity Section that Judge Blackshear and U.S. Trustee Edward White had committed perjury. Public Integrity opened an investigation that ultimately found perjury cases could not be proven, and recommended declining prosecution.[47]

The Senate report

The first Congressional investigation into the Inslaw case came from the Senate's Permanent Subcommittee on Investigations (PSI). PSI's report was issued in September 1989, after a year and a half of investigation.[48] During the investigation, Inslaw made a number of new allegations, which take up most of the PSI report.

1. **New allegations**
   - Inslaw's new allegations described the Justice Department dispute with Inslaw as part of a broad conspiracy to drive Inslaw into bankruptcy so that Earl Brian, the founder of a venture capital firm called Biotech (later Infotechnology), could acquire Inslaw's assets, including its software Promis. Inslaw owner William Hamilton told PSI investigators that Brian had first attempted to acquire Inslaw through a computer services corporation he controlled, called Hadron. Hamilton said that he rejected an offer from Hadron to acquire Inslaw, and that Brian then attempted to drive Inslaw into bankruptcy through his influence with Attorney General Edwin Meese.[49]
   - Both Meese and Brian had served in the cabinet of Ronald Reagan when he was governor of California, and Meese's wife had later bought stock in Brian's company, so that Meese was willing to do this, Hamilton claimed. The contract dispute with DOJ was contrived by Brian and Meese with the help of Associate Attorney General Jensen, and Promis project manager Brewer.[50]
   - Hamilton also complained that a DOJ automation program, 'Project Eagle', was part of a scheme to benefit Brian after he acquired Promis,[51] and that an AT&T subsidiary, AT&T Information Systems, had engaged with the DOJ in a conspiracy to interfere with Inslaw's efforts to reorganize.[52] He also told PSI investigators that the DOJ had undermined Bankruptcy Court Judge Bason's reappointment,[53] and had attempted to undermine Inslaw's lead counsel in the bankruptcy suit.[54]
2. **Report findings**
   - Senate investigators found no proof for any of these claims. Their report noted that the bankruptcy court ruling had not concluded that Jensen had engaged in a conspiracy against Inslaw and that their own investigation had found no proof that Jensen and Meese had conspired to ruin Inslaw or steal its product, or that Brian or Hadron were involved in a conspiracy to undermine Inslaw and acquire its assets.[55]
   - The report did re-examine the bankruptcy finding that the DOJ had pressured the United States Trustee to recommend converting Inslaw's bankruptcy from Chapter 11 to Chapter 7, and found that EOUST director Thomas Stanton had improperly tried to get special handling for Inslaw's bankruptcy. He did this, the report stated, in order to gain support for the EOUST from the DOJ.
   - The report concluded that the Subcommittee found no proof for a broad conspiracy against Inslaw within the DOJ, or a conspiracy between DOJ officials and outside parties to force Inslaw into bankruptcy for personal benefit. However, it criticized DOJ for hiring a former Inslaw employee (Brewer) to oversee Inslaw's contract with EOUSA, and for failing to follow standard procedures in handling Inslaw's complaints. It also criticized the DOJ for a lack of cooperation with the Subcommittee, which delayed the investigation and undercut the Subcommittee's ability to interview Department employees.[56]

The House report

Following the PSI report, the House Judiciary Committee began another investigation into the dispute.[57] By the time the report was released in September 1992, Inslaw's bankruptcy suit had been first upheld in the D.C. Circuit Court, then vacated by the D.C. Appeals court. The House report thus took a different approach to several of the legal issues that the Senate report had discussed. Like the Senate report, much of the House report dealt with new evidence and new allegations from Inslaw.

1. **New allegations**[edit]
   - Inslaw's new evidence consisted of statements and affidavits from witnesses supporting Inslaw's previous claims. The most important of these witnesses was Michael Riconosciuto, who swore in an affidavit for Inslaw that businessman Earl Brian had provided him with a copy of Inslaw's enhanced Promis, supporting Inslaw's earlier claims that Brian had been interested in acquiring and marketing the software. A new allegation was also introduced in Riconosciuto's affidavit: Riconosciuto swore that he added modifications to enhanced Promis "to support a plan for the implementation of PROMIS in law enforcement and intelligence agencies worldwide." According to Riconosciuto, "Earl W. Brian was spearheading the plan for this worldwide use of the PROMIS computer software."[58]
   - Another important witness was Ari Ben-Menashe, who also provided affidavits for Inslaw that Brian had brought both public domain and enhanced versions of Promis to Israel, and eventually sold the enhanced version to the Israeli government.[59] Committee investigators interviewed Ben-Menashe in May 1991, and he told them that Brian sold enhanced Promis to both Israeli intelligence and Singapore's armed forces, receiving several million dollars in payment. He also testified that Brian sold public domain versions to Iraq and Jordan.[60][61]
2. **Report findings**[edit]
   - On the issue of Inslaw's rights in "enhanced Promis", the House report found that "There appears to be strong evidence" supporting Judge Bason's finding that DOJ "acted willfully and fraudulently" when it "took, converted and stole" INSLAW's Enhanced PROMIS by "trickery, fraud and deceit."[62]
   - Like Judge Bason, the report found that DOJ did not negotiate with Inslaw in good faith, citing a statement by Deputy Attorney General Arnold Burns as "one of the most damaging statements received by the committee."[63] According to the report, Burns told OPR investigators that Department attorneys informed him in 1986 that INSLAW's claim of proprietary rights was legitimate and that DOJ would probably lose in court on this issue. House Investigator found it "incredible" that DOJ would pursue litigation after such a determination, and concluded "This clearly raises the specter that the Department actions taken against INSLAW in this matter represent an abuse of power of shameful proportions."[63]
   - On the new allegations brought by Inslaw, although the Committee conducted extensive investigations, the report did not make any factual findings on the allegations, it did conclude that further investigation was warranted into the statements and claims of Inslaw's witnesses.
   - The report also discussed the case of Danny Casolaro, a free-lance writer who became interested in the Inslaw case in 1990, and began his own investigation.[64] According to statements from Casolaro's friends and family, the scope of his investigation eventually expanded to include a number of

scandals of the time, including the Iran-Contra affair, the October Surprise conspiracy claims, and the BCCI banking scandal. In August 1991, Casolaro was found dead in a hotel room where he was staying. The initial coroner's report ruled his death suicide, but Casolaro's family and friends were suspicious, and a lengthy second autopsy was conducted. This too ruled Casolaro's death a suicide, but House investigators noted that "The suspicious circumstances surrounding his death have led some law enforcement professionals and others to believe that his death may not have been a suicide," and strongly urged further investigation.[65]

- The Democratic majority called upon Attorney General Dick Thornburgh to compensate Inslaw immediately for the harm that the government had "egregiously" inflicted on Inslaw. The Republican minority dissented and the committee divided along party lines 21–13.[61]

Bua report

In October 1991 William P. Barr succeeded Dick Thornburgh as Attorney General. In November, Barr appointed retired federal judge Nicholas J. Bua as a Special Counsel to investigate the allegations in the Inslaw case.[66] Bua was granted authority to appoint his own staff and investigators, to impanel a grand jury, and to issue subpoenas.[67] In March 1993 he issued a 267-page report.

The report concluded that there was no credible evidence to support Inslaw's allegations that DOJ officials conspired to help Earl Brian acquire Promis software, and that the evidence was overwhelming that there was no connection between Brian and Promis.[68] It found the evidence "woefully insufficient" to support the claim that DOJ obtained enhanced PROMIS through "fraud, trickery, and deceit," or that DOJ illegally distributed PROMIS inside or outside of DOJ.[68] It found no credible evidence that DOJ had influenced the selection process that replaced Judge Bason.[68] It found "insufficient evidence" to confirm the allegation that DOJ employees sought to influence the conversion of Inslaw's bankruptcy or commit perjury to conceal the attempt to do so.[68] Finally, it concluded that the DOJ had not sought to influence the investigation of Danny Casolaro's death, and that the physical evidence strongly supported the autopsy finding of suicide.[69]

Bua's report came to a number of conclusions that contradicted earlier proceedings and investigations. Judge Bason had found that DOJ's claim it was concerned about Inslaw's financial condition when it requested a copy of Promis was a false pretext. Bua rejected this finding as "just plain wrong."[70] The House report had cited Deputy Attorney General Burns' statements as evidence that DOJ knew it did not have a valid defense to Inslaw's claims. Bua found this interpretation "entirely unwarranted."[71]

Bua was particularly critical of several of Inslaw's witnesses. He found that Michael Riconosciuto had given inconsistent accounts in statements to the Hamiltons, his affidavit, and in testimony at his 1992 trial for manufacturing methamphetamine.[72] Bua compared Riconosciuto's story about Promis to "a historical novel; a tale of total fiction woven against the background of accurate historical facts."[73]

Bua found Ari Ben-Menashe's affidavits for Inslaw inconsistent with his later statements to Bua, in which Ben-Menashe said that he had "no knowledge of the transfer of Inslaw's proprietary software by Earl Brian or DOJ" and denied that he had ever said this elsewhere.[74] Ben-Menashe said that others simply assumed that he was referring in his previous statements to Inslaw's Promis, but acknowledged that one reason he failed to clarify this was because he was going to publish a book and "he wanted to make sure that his affidavit was filed in court and came to the attention of the public."[75]

Bua also noted that the House October Surprise Task Force had examined Ben-Menashe's October Surprise allegations and found them "totally lacking in credibility," "demonstrably false from beginning to end," "riddled with inconsistencies and factual misstatements," and "a total fabrication." He specifically observed that the Task Force found no evidence to substantiate Ben-Menashe's October Surprise allegations about Earl Brian.[76]

DOJ review

Inslaw responded to the Bua report with a 130-page *Rebuttal*,[77] and another set of new allegations in an Addendum. These allegations included the claim that the DOJ's Office of Special Investigations was "a front for the Justice Department's own covert intelligence service" and that "another undeclared mission of the Justice Department's covert agents was to insure that investigative journalist Danny Casolaro remained silent about the role of the Justice Department in the INSLAW scandal by murdering him in west Virginia in August 1991."[78]

By this time, Janet Reno had succeeded Barr as Attorney General after Bill Clinton's election as president. Reno then asked for a review of Bua's report with recommendations on appropriate actions. In September 1994, the Department released a 187-page review (written by Assistant Associate Attorney General John C. Dwyer) which concluded that "there is no credible evidence that Department officials conspired to steal computer software developed by Inslaw, Inc. or that the company is entitled to additional government payments."[79] The review also reaffirmed the earlier police findings that Casolaro's death was a suicide and rejected Inslaw's claim that OSI agents had murdered Casolaro as "fantasy," with "no corroborative evidence that is even marginally credible." [80]

Court of Federal Claims trial and ruling

In May 1995, the United States Senate asked the U.S. Court of Federal Claims to determine if the United States owed Inslaw compensation for the government's use of Promis. On July 31, 1997, Judge Christine Miller, the hearing officer for the U.S. Court of Federal Claims ruled that all of the versions of Promis were in the public domain and that the government had therefore always been free to do whatever it wished with Promis.[81][82] The following year, the appellate authority, a three-judge Review Panel of the same court, upheld Miller's ruling and in August 1998 informed the Senate of its findings.[81]

Later developments

A 1999 book by the British journalist Gordon Thomas, titled *Gideon's Spies: The Secret History of the Mossad*, repeated the claims of Ari Ben-Menashe that Israeli intelligence created and marketed a Trojan horse version of Promis in order to spy on intelligence agencies in other countries.[83]

In 2001, the *Washington Times* and *Fox News* each quoted federal law enforcement officials familiar with debriefing former FBI Agent Robert Hanssen as claiming that the convicted spy had stolen copies of a Promis-*derivative* for his Soviet KGB handlers. Later reports and studies of Hanssen's activities have not repeated these claims.

1991 Vanity Fair magazine : THE STRANGE DEATH OF DANNY CASOLARO (by RON ROSENBAUM)

Investigation - Was the reporter who claimed to have found the missing link between Iran-contra, the October Surprise, and B.C.C.I. a victim of a conspiracy—or of conspiracy theories?

Source - [HP004G][GDrive]

One of the first stories I heard about Danny Caso laro's funeral was the five blondes at the grave site. Five stunners ranging in age from twenty to forty, all dressed in black, all weep ing copiously.

I was feeling pretty bad about Danny myself, for my own reasons. I'd been thinking, Maybe I shouldn't have yelled at him the last time we spoke. Maybe I shouldn't have been so harsh, shouldn't have told him, "Danny, you've got to get ruthless with yourself. ' '

I'd been feeling that way ever since the morning of August 13, when I was idly flipping through The Washington Post and froze at the headline: "WRITER PROBING INSLAW CASE FOUND DEAD— Freelancer Was in West Virginia to Meet Source, Friends Say."

Friends were saying more than that. Friends and family were disputing the local coroner's hasty preliminary verdict of suicide, a verdict issued before the locals learned about who Danny was and what kind of story he'd been looking into. About the death threats and warnings he'd been getting in the final weeks before he was found, his wrists sliced open with an X-Acto-type blade in a bloody motel-room bathtub. The friends were saying that Danny was hot on the trail of the long-sought Missing Link between the scandals that had been convulsing Washington—B.C.C.I., the October Surprise, and Iran-contra—and that he was killed to keep him quiet.

And it wasn't just friends saying this: a former U.S. attorney general, Elliot Richardson, the ordinarily circumspect Brahmin, was calling for a federal investigation, and suggesting Danny "was deliberately murdered because he was so close to uncovering sinister elements in what he called 'The Octopus.' " Was this another Silkwood case? Was Danny murdered because he was "The Man Who Knew Too Much," as Time put it?

But at that point I wasn't thinking murder. I was thinking guilt—my own. I'd had several phone conversations with Danny about his Octopus idea in the weeks before he died, and I'd been pretty skeptical: a lot of it sounded like a rehash of familiar conspiracy-theory connections. That's what I'd meant when I raised my voice and enjoined him to be "ruthless" with himself: slash away the underbrush, so that whatever he had that was news would emerge. Still, when someone you've yelled at to be ruthless with himself is found dead with his wrists slashed, it makes you wonder if he took your words too much to heart.

Which is why I had to go down to West Virginia. Which is why I'm sitting fully clothed in an empty bathtub in the motel room just across the hall from the one in which Danny died, here at the Sheraton Martinsburg ("where meetings and fitness are our business"). Staring up at the cheap cottage-cheese-textured ceiling of the bathroom, perhaps the last sight Danny Casolaro saw.

I've spent the past ten days immersing myself in Danny's world, retracing his steps from the fragments and pieces of the puzzle he left behind in his notes, trying to reconstruct the vision of the Octopus that led him to meet his death here. To see if I could find out, to my own satisfaction, the answer to the murder-orsuicide question: Did Danny Casolaro die because he was, in some sense, too ruthless with himself? Or because someone got too ruthless with him?

"Danny, this story isn't fun, it's no adventure. It's traumatic, it's a disease, it's like going into the depths of insanity. ... It [the story] is the Octopus." —Danny's friend Ann Klenk, summer 1991.

I didn't know the guy well. Met him about a dozen years ago down in D.C. I was doing a story about revisionist Watergate theories for The New Republic and someone had referred me to Danny as a guy who was pursuing the "Democratic trap" theory—the idea that shadowy figures in the intelligence community hostile to Richard Nixon actually set up the Nixon White House for the Watergate bust.

What I remember most about that evening was not so much the mysteries of Watergate as the mystery of Danny.

The Arabian horses, for instance. Not many investigative reporters I knew raised thoroughbred Arabians in the heart of Virginia horse country. Danny did. Good-looking, good-natured, goldenhaired Danny looked less the ink-stained wretch most investigative reporters are than a Fitzgerald golden boy. I was left with a hazy impression of a Gatsbyesque horsey-set dabbler in the arcana of right-wing conspiracy theories.

In fact, it turns out Danny did have a kind of Gatsby fixation, one that apparently persisted until the final hours of his life. One of the last people to report seeing him alive was a waitress at a Pizza Hut, the one that shares a parking lot with the Sheraton Martinsburg. She describes Danny as flirting with her in a lighthearted way on the Thursday afternoon before his body was found. She says that Danny, apparently in high spirits, was quoting to her some lines from a favorite poem, the one about the "goldhatted, high-bouncing lover" that Fitzgerald used as the epigraph to The Great Gatsby.

According to Wendy Weaver, an attractive blonde ad exec who was Danny's steadiest girlfriend, Danny was a romantic who loved to quote those particular lines, because it was how he saw himself. Once, Wendy told me, "he painted a tin hat gold, and came into a restaurant that I was in, wearing a tuxedo and carrying roses."

Had Danny struck gold in his Octopus investigation or was he just gilding tin? What was the grail he died trying to find?

He started calling me last winter—I hadn't heard from him in years—first to ask for a copy of a story I'd done for V.F. involving "the Blond Ghost," the legendary ex-C. I. A. -covert-operations mastermind Ted Shackley ("The General and 'the Blond Ghost,' " January 1990). He was pursuing some leads concerning Shackley, he said. Danny wouldn't tell me anything more at that point than that he was working on "something really big," that there was a Shackley angle to it, and that he was reluctant to elaborate ("It would take hours").

Then, this past summer, two months before he died, he started calling me again, asking me for advice on a proposal for a book, a book he wanted to call The Octopus, about a shadowy group of rogue intelligence operatives who, in a Ghostly way, were linked to spectacular covert-world-generated scandals from the Bay of Pigs and Watergate to Iran-contra, B.C.C.I., and the October Surprise.

I liked the guy, but when I tried to cut through the thicket of conspiracy-theory connections he was reeling off for me, I just couldn't get a clue to what he might have that was new.

And there was something in Danny's tone of voice that disturbed me, something I'd heard before: that note of smug, condescending certainty that begins to creep into the voice of those who feel they have it All Figured Out and are quite beyond the need to document and substantiate. (Later he left a message on my answering machine thanking me specifically for the advice to be ruthless—it was the last I heard from him.)

And so as I headed down to Washington and West Virginia to begin retracing the last journey Danny took, I was so skeptical about the Octopus murder theory that I even harbored a suspicion that Danny might have staged his own death. That, while his friends were saying it was murder disguised to look like suicide, maybe it was really a suicide staged to provoke suspicion of murder. That by killing himself and leaving enough ambiguities to raise the possibility of murder Danny would make his own death the sensational final chapter of the book he never wrote—the one thing that would validate the seriousness of the quest he was on. It would be the Gatsbyesque thing to do.

But now I think I may have wronged him in at least one respect. By the time I got to the motel here in Martinsburg— after spending hours immersed in his notes, days talking with his friends, nights having strange conversations with his sources—I still didn't believe in the Ludlumesque Octopus conspiracy Danny hyped up for his book proposal. But I now believed that he was onto something, that his investigations were real, and that, in the months before his death, they were taking him into areas that involved dangerous knowledge and dangerous characters—one of whom had already been convicted of "solicitation of murder. ' '

> *"Will you kiss me when I'm dead?" —Danny Casolaro to Ann Klenk three weeks before he died.*

The line that best characterizes the kind of journey Danny Casolaro was on in the months before his death was one I found on a scrap of paper amid the literally thousands of sheets and scraps of notebook paper, envelopes, and cocktail napkins I'd been studying. (Was the "Denise" whose number is written on a cocktail napkin from a bar in Tacoma, Washington, a key source or a waitress he was trying to pick up?)

Five big file boxes of Danny's Octopus-investigation notes were retrieved from his basement office by his close friend Ann Klenk, who raced over there as soon as she got the news he was dead.

"He'd told me several times that summer that if I heard he met with an accident, make sure I got that shit out of there," says Klenk, an attractive ex-girlfriend who stayed close to him for twelve years after they broke up. Over dinner at a place near her CNBC office, where she works as a producer for Jack Anderson, she told me that, toward the end, a change had come over Danny. That his obsession with the story had become grim and all-consuming and that one evening at her place he'd turned to her and asked, "Will you kiss me when I'm dead?" (Danny's brother Dr. Anthony Casolaro reports that in the last couple of months Danny warned him "not to believe it" if he died in what was reported to be an "accident.")

Was this another Silkwood case? Was Danny murdered because he was "The Man Who Knew Too Much"?

Anyway, there it was on a scrap of notepaper in Danny's files, that line, written in his cheap ballpoint, probably the best testimony to how he had come to see his quest:

In the middle of the journey of our life, I found myself in a dark wood, having lost the straight path.

It is, of course, the opening passage of the Inferno, the description of Dante's state of mind when he came upon the hole in the world that led down to the gates of hell.

Danny Casolaro's dark wood was a bizarre, tangled lawsuit involving a computer-software company called INSLAW; unfortunately, his guide was not exactly the wise Virgil figure who took Dante in hand. Danny's guide—some would say his Svengali—was a Machiavellian rogue scientist who wove the web Danny was tracing from a jail cell in Tacoma. And the hole in the world Danny fell into was a sunbaked Indian reservation located, appropriately enough, a few hours south of Death Valley as the buzzard flies.

Before plunging into that dark wood, it might be useful now to fill in the picture of the pre-Octopus Danny. He was always a restless soul. The son of a successful obstetrician, he grew up to be an affable, athletic six-footer, a boxer with a touch of the poet, searching for something more than his suburban-Virginia setting offered. At age sixteen, his brother Tony remembers, "Danny got it in his head to go down to Peru to look for the lost Inca treasure." Tony recalls he got only "as far as Ecuador, where he ran into some rich guy" who distracted him into a scheme to ship corbina fish to the U.S.

Danny's first brush with a mysterious death came when his younger sister died in San Francisco's Haight-Ashbury in the late sixties. It was never certain whether it was an accidental death or suicide. But friends say the traumatic effect of the death on his family made Danny, a Catholic, even more adamantly antisuicide.

After graduating from Providence College in 1968, Danny began a writing career that shifted fitfully back and forth between fiction and nonfiction. In a ten-year-old resume I dug out of the file boxes retrieved from his house, Danny informs us that, "in 1969, I wrote two books and authored the initial treatment for Rain for a Dusty Summer, a film starring Ernest Borgnine.

"From 1970 to the present [circa 1982], I've been a Washington correspondent, contributor, columnist, editor for national magazines, daily newspapers, weekly newspapers, professional journals and trade journals including World News, National Star, London Sun, Sydney Daily Mirror, National Enquirer. . .El Dorado News Times, Home and Auto, Washington Star, American Paint Journal. . .Media Horizons magazines. . . Washington Crime News."

A mixed bag, perhaps skewed a bit toward the supermarket tabs, but Danny goes on to claim, "During these years my investigative work included reporting on some of the most important stories of the decade. In 1970-71 I was one of the first journalists to expose the renewed Soviet Naval presence in Cuba, prompting the U.S. Government official warning statements. ... In 1971 I was one of the first U.S. journalists to uncover the make up and composition of the Castro intelligence network in the U.S. . . . In 1972-3 I was the first journalist to expose how the Chinese Communists were smuggling opium into America. In 1973 to 1974 I was the first journalist to expose and document the 'prior knowledge of Watergate' story, a major breakthrough showing an untold side of the Watergate Scandal."

In fact, there's some doubt about where his investigative output on some of these stories appeared. Reed Irvine, the chairman of the right-wing watchdog group Accuracy in Media, recalls that Danny came to talk to him about his revisionist Watergate theory. "But he never wrote anything for us and I never saw

group Accuracy in Media, recalls that Danny came to talk to him about his revisionist Watergate theory. "But he never wrote anything for us and I never saw anything on the subject he ever wrote," Irvine told me. "I think he was one of those guys who liked to talk big but never delivered."

What's interesting about Danny's investigations is that they all had a definite right-wing agenda. Subversive Castro spy networks, sinister opium-peddling Red Chinese, Soviet naval nukes in Cuba—these suggest Danny had a pipeline into right-wing intelligence networks, or at least hard-right propagandists. It's ironic that Danny's Octopus conspiracy theory has been picked up by the left-leaning Christie Institute. Because a close reading of his book proposals makes it clear that Danny viewed the Octopus as something that subverted the right-thinking, anti-Communist covert operations he believed in, like the Bay of Pigs.

By the end of the seventies, Danny's life changed in a couple of important ways. His ten-year marriage to his wife, Terrill, a former Miss Virginia, came to an end. She moved to Florida; their son, Trey, stayed with him. It was, by all accounts, a shattering breakup. "He loved her deeply, very deeply," Ann Klenk told me. "He even started writing a book about her. It was a romantic novel, he called it Pursuit."

Around that time, Danny dropped out of journalism and became a kind of entrepreneur. He started working for, then acquiring, a series of computer and dataprocessing trade journals. He began making good money, but with daily and weekly deadlines, he had little time for the kind of investigations he once boasted of. By the mid-eighties, after playing the field with a succession of what his friends invariably describe as remarkably beautiful women, he entered into a long-running relationship with Wendy Weaver.

"It was love at first sight for me," says Wendy, still very starry-eyed about Danny. "He was magnetic, charming, charismatic."

But then, at the end of the decade, just when it seemed he'd settled down into a comfortable, early middle age, he found himself adrift. He'd decided to sell his chain of computer publications, but according to friends and family, "Danny was really out of his league making the deal. He just didn't have a business sense." He walked away with a sum not commensurate with the sweat equity he had put in over the years.

Another friend says that Danny's bitterness over the deal marked the beginning of "a clear deterioration in his morale. He was not the kind of guy to run around bitterly raging. Danny just internalized. He felt under pressure to make something of himself in a highly achievement-oriented environment."

Danny set out to settle the score with fete by bagging that One Big Story, the contemporary equivalent of the Inca treasure.

His friends recall an enormously generous guy who'd throw them surprise bon voyage parties and write them soulful birthday poems. "He was someone with an incredible ability to give love, but he had trouble taking it in," another ex-girlfriend told me.

Clearly, something was missing. And so, in the spring of 1990, Danny set out to settle the score with fate by bagging that One Big Story, the contemporary equivalent of the lost treasure of the Incas.

> *"This story killed my friend, and I want very simple questions answered. . . . These people who were jerking him around—whether he killed himself or he was killed—/ still hate them." —Ann Klenk*

It was Danny's computer-world contacts that brought him to the INSLAW case, and it was INSLAW that brought him into the ambit—some would say under the spell—of the rogue scientist/ weapons designer/platinum miner/alleged crystal-meth manufacturer who sent Danny off on the quest for the grail he was to die seeking.

The INSLAW case alone is enough to drive a sane man to madness, if not suicide. The INSLAW lawsuit has devoured the lives of those involved the way the all-consuming Jarndyce v. Jarndyce Chancery suit devoured its progeny in Bleak House. If they ever make a movie of the INSLAW suit, it could be called Mr. and Mrs. Smith Go to Washington and Meet Franz Kafka.

The Mr. and Mrs. Smith in question are Bill and Nancy Hamilton, an earnest, dedicated St. Louis couple who went to Washington and, in the early seventies, began working on the hightech side of the war on crime, INSLAW, the software company they built, designed a breakthrough program for use by U.S. attorneys in administering the crime war: it tracks cases, ranking their priorities and helping allocate resources to them. It put INSLAW on the ground floor of a potential quarter-billion-dollar market.

[NOTE - See "**1990 (Oct 01) - Washington Post - "OBSESSED BY A THEORY OF CONSPIRACY" /** Source - [HN01C5][GDrive]]

Then, the Hamiltons claim, their company became a crime victim. They charge that elements within the Justice Department—cronies of Reagan attorney general Ed Meese's—plotted to sabotage their contract with Justice, drive the company into bankruptcy, and steal the valuable software for their own profit. Farfetched as that might sound, back in 1987 a federal bankruptcy judge ruled definitively in favor of Mr. and Mrs. Hamilton, declaring that the Justice Department had used "trickery, fraud, and deceit" to misappropriate the software and then tried to drive INSLAW out of business. (The decision, reversed on appeal, is now heading for the Supreme Court, where Elliot Richardson will argue the Hamiltons' case.)

But this victory was merely the cue for the real Kafkaesque weirdness to begin. Suffice it to say that the Hamiltons, struggling desperately to escape from bankruptcy, began to suspect there was something larger going on behind the scenes that accounted for what they saw as a pattern of mysterious interventions and string pulling directed against them.

Then along came a master conspiracy theorist who confirmed their darkest suspicion: That they weren't in the world of Kafka but that of Robert Ludlum. That the alleged theft of their software by Reagan-Meese Justice Department cat'spaws was actually a key element in the hottest new conspiracy theory of them all. He told them that their case was, in effect, the grassy knoll of the October Surprise plot.

His name is Michael Riconosciuto, and he's the rogue scientist and self-proclaimed former covert operator who became the Hamiltons' tutor and Danny's Svengali. (It should be noted that the person who brought Riconosciuto to the Hamiltons' attention was a key lieutenant of conspiracy-cult leader Lyndon LaRouche; LaRouche intelligence reports were also found in Danny's files.)

In May 1990, according to the Hamiltons' internal "Memorandum for the Record" I found in Danny's files—a memo which became a road map for Danny's fatal journey—Riconosciuto gave the Hamiltons the following account:

That in October 1980, Riconosciuto was serving as director of research of a weapons-design project operating out of the sparsely populated Cabazon Indian Reservation in the California desert (there were only twenty-four Cabazons living there at the time). That Bill Casey—then Reagan-campaign director, later C.I.A. head—hired Riconosciuto and a Reagan confidant, Earl Brian, to undertake a secret mission to Iran.

Riconosciuto told the Hamiltons that he "did the electronic funds transfer" to convey a payoff of more than $40 million to "certain elements in Iran" to "prevent a deal with the Carter Administration to release the American hostages prior to the election."

Riconosciuto added that Brian's reward was a kind of license to grab the Hamiltons' lucrative software, with the help of Reagan's Justice Department minions. Riconosciuto further told the Hamiltons that he "saw documents" in the law offices of a former U.S. senator in which the INSLAW-related October Surprise payoff was "chiselled in stone." (Brian denies all these charges and any connection to the INSLAW case.)

Enter Danny Casolaro. In the summer of 1990, shortly after Riconosciuto had disgorged the details of this story to the Hamiltons, Danny showed up in their offices on K Street in downtown Washington, expressing interest in doing some kind of story on the INSLAW case. And at some point that summer the Hamiltons made available to Danny their twelve-page Riconosciuto memo with its profusion of suggestive and seductive leads, its wealth of references to code names, cover-ups, corporate fronts, cutouts, and covert ops—all of which show up in the notes Danny left behind, many of which go far beyond the October Surprise.

The moment he got his hands on that maddening memo, with its maze of illusion and reality, was the moment Danny's life changed and he began his descent into the obsession that would lead to his death. He was slowly, then rapidly, sucked into a kind of covert-ops version of Dungeons & Dragons, with that memo as his guide and Michael Riconosciuto as his Dungeon Master.

"Stop it, Danny. Just stop it! Get a job. Just let this goddamn story go." —Ann Klenk

In Danny, Riconosciuto found the perfect audience. The spook and the journalist have always shared an affinity: each thriving in a realm of secrets and lies, cover-ups and cover stories, sharing the romance of the covert mentality, with its thrilling sense of being privy to the secret heart of matters undreamt of by the ordinary, CNN-watching citizen. And both Casolaro and Riconosciuto were in a similar position: lone operatives freelancing on the fringe, longing to be at center stage.

The turning point in their relationship came when a dramatic prediction Riconosciuto made seemed to come true. In February 1991, he told Danny, a highranking Justice Department official had warned him not to give a deposition to House Judiciary Committee staffers investigating the INSLAW controversy or he'd end up in jail. Several weeks later, federal agents arrested Riconosciuto on charges of distributing speed. (Riconosciuto, who did talk to Judiciary Committee staffers, insists the chemicals were actually being used in an innovative process for refining platinum ore; the Justice Department official has denied making any threat.) As soon as he got news of the arrest, Danny hopped a jet and flew all night cross-country to Tacoma, where he spent ten days working as an unpaid, unofficial investigator of the Riconosciuto "frame-up"—and of the endless tangled tales of intrigue and dirty tricks this imprisoned Scheherazade of the spook world had to tell.

Not many investigative reporters I knew raised thoroughbred Arabians in the heart of Virginia horse country. Danny did.

"Danny said that when he started out he only believed 5 percent of what I was saying" and doubted 95 percent. "But by the end," Riconosciuto boasted to me from jail during one of our marathon conversations, the ratio was reversed.

I'd still put his credibility at Danny's original figure of 5 percent—but even so, the 5 percent that does check out makes Riconosciuto one of the more remarkable characters I've encountered in years of debriefing spook types. If he's a liar, he's not your ordinary liar. He's extraordinarily skillful at weaving fact and fiction into a seamless web of seductive intrigue. And he did direct Danny down some dark paths in which he came into contact with some seriously dangerous dudes.

"These people in the desert were murdered. Murder, dope, government. That's dangerous. Think about it, Danny." —Warning from "Clark Gable."

It was a whipsaw, a psychological whipsaw, Danny Casolaro got caught in. A cruel game of paranoid psychout played with Danny's head. The players batting him back and forth were Michael Riconosciuto and his longtime shadow-world nemesis, the man we'll call, for reasons to be clear soon enough, "Clark Gable."

But it was no game, it was a long-distance duel. In fact, the only thing the two men agree on is this: Danny's death was murder. And each implies the other may well have had something to do with it.

Let's look first at Riconosciuto. Here are some of the things he told Danny— and me—about himself:

That he was a child prodigy who developed a powerful argon-based laser, then went to work in the lab of a Nobel Prize-winning scientist at Stanford at age sixteen. That his grandfather was a top military aide who worked with an early C.I.A. chief, General Walter Bedell Smith—family connections, he said, "opened a lot of doors for me."

That from Stanford he went on to Haight-Ashbury in the sixties, where he was responsible for an undergroundnewspaper spread in which, he said, "we published pictures of narcotics agents," including one "showing [an agent] having sex with these under-age girls that we took from a rooftop."

Ultimately, Riconosciuto told Danny and me, vengeful narcs engineered his "frame-up" on charges of manufacturing psychedelic drugs.

In Danny's notes I found evidence that he'd checked out these claims, even getting Riconosciuto's grades and I.Q. from a parochial school he attended: the I.Q. was a somewhat-less-than-prodigylevel 124; the story about building the argon laser is true. But Danny dug up clips which tell a somewhat different version of the narc-sex-vengeance "frame-up." They report that Riconosciuto was arrested in Seattle in September 1972 by "federal narcotics agents who say they have had the defendant under surveillance off and on since 1968." What Riconosciuto said back then at his trial was that sinister drug people tried to force him to make psychedelic drugs, threatening to kill him if he didn't do their bidding. They'd already been "responsible for 14 murders," he told the court.

That figure—"14 murders"—rang a bell. In my first conversation with Riconosciuto, I was exploring some cryptic but provocative notes I'd found in Danny's files about "biological warfare" projects. The notes made references to the possibility of manufacturing "slowacting brain viruses" such as "Mad Cow Disease" which could be slipped into "meat pies." (Hey, I just report the facts here.)

Riconosciuto was reluctant to talk about the germ-warfare leads. "It's a real Dr. Strangelove tale," he said. "But it's obviously real enough that anybody who's ever come near it has gotten killed. And Danny was starting to make progress."

When I asked him to elaborate on the germ-warfare story, he uncharacteristically—or perhaps theatrically— clammed up. "I really don't want to be the one to say, you know, because I know of fourteen people that are dead that have tried to come out publicly on this."

While it's clear Riconosciuto has a special affection for the figure of fourteen deaths, that's only a fraction of the mortality rate around him, he said. "That's only on the 'biotech,' " as he called the germ-warfare stuff. "There's almost fifty dead total that have been connected with me in one way or another since the early eighties."

While this claim captures the paranoid flavor of conversations with Riconosciuto, it's deceptive in one sense. Because, while there may not have been fifty, or even fourteen, there were some real, documentable murders happening around him, particularly after he arrived at the Cabazon Indian Reservation in the early eighties and became involved with Clark Gable and "Dr. John."

The whole Cabazon-reservation maze Danny was pursuing is further proof that the reality of the covert-ops shadow world will always outinvent the cliches of a Tom Clancy. It is also, to my mind, the strongest barrier to believing Danny's death was a simple suicide. Regardless of what money problems he had, or book-proposal rejections he suffered, he was really onto a story here.

His investigations were taking him into areas that involved dangerous knowledge and dangerous characters.

Evidence that Danny was onto something real can be found in a frontpage, three-part investigative series in the respected San Francisco Chronicle that appeared three weeks after Danny died and that was inspired in part by his probe into the Cabazon-reservation enigma.

"Just fifteen years ago," Chronicle reporter Jonathan Littman begins, "a handful of Cabazon Indians barely scratched out a living on their reservation in this tumbleweed desert just north of the Salton Sea," near Indio, California. But since a "mystery man," Dr. John Nichols, took control of their affairs as the "administrator" of the tiny tribe, a staggering quarter-billion dollars has been poured into projects based on the reservation.

What Nichols did was leverage the one asset of the woebegone Cabazon band—their "sovereign status" as a quasi-independent nation, which allows them to build casinos and enter into joint ventures with corporations. Such joint ventures are shielded to some degree from the usual legal and regulatory scrutiny, making the reservation extremely attractive to the kind of enterprise which prefers to operate in the shadows. In fact, Dr. Nichols (the doctorate is of divinity) seemed to have close contacts with C.I.A. and military-intelligence operatives (according to the Chronicle, he would tell some that he'd had a hand in the C.I.A. assassination attempts on Fidel Castro and Salvador Allende). Contacts which attracted to the desolate reservation what the Chronicle called "a maze of politicians, military officers, organized crime figures, intelligence agents, foreign officials ranging from Saudi sheiks to Nicaraguan Contras."

One of the people who materialized in this maze is our friend Michael Riconosciuto. He claimed he'd spent the years since his psychedelic-lab bust as a government informer on the anti-war movement and as a covert C.I.A. operative in South America (where he says he first met Dr. Nichols) infiltrating the liberationtheology movement. Back in the States, Riconoseiuto then became the "technical adviser" to mystery man Dr. Nichols on the reservation. Before long, Riconoseiuto says, he began to learn about some "horrible things" going on out there.

This is the labyrinth Riconoseiuto was leading Danny into—the one he died in. The Chronicle reporter tells us that, "just days before his death," Danny Casolaro "planned to visit the Reservation.

. . . Although he did not divulge what role the Cabazons may have had in the conspiracy [he was investigating], Casolaro. . . recently told this reporter that one of the titles he was considering for his [Octopus] book was Indio."

It would have been a more accurate title. Indeed, the grandiose "Octopus" of Danny's maladroit, overhyped book proposal was—to continue the piscine imagery—a red herring. But there was a lowercase octopus out there in the desert beyond Indio.

Riconoseiuto himself, the resident demon of this labyrinth, supports the more modest, lowercase characterization of the octopus: "Danny's theory was different" from the typical megaconspiracy theory, he told me. "Danny was dealing with real people and real crimes."

One of the crimes was murder. Several murders, all unsolved. One victim was Michael Riconosciuto's "business partner," a man named Paul Morasca, whom he candidly describes as a money launderer. Morasca was found hog-tied and asphyxiated in a San Francisco apartment. One of the initial suspects in the murder was Michael Riconoseiuto himself, and he says the accusation shocked—shocked—him, and motivated him to spill the beans on all the dirty deeds done on the reservation.

He claims he was responsible for pinning a "solicitation of murder" charge on Dr. Nichols for trying to hire a hit man to kill some casino associates on the reservation. (Nichols pleaded no contest and served sixteen months' jail time on the charge.) A Cabazon spokesman has said, "There's nothing sinister going on at the reservation. It's just a very successful operation."

Anyway, it was in the midst of this film noir intrigue out there in the sterile desert flats that Riconoseiuto first encountered the man who would become his partner, his target, his obsession, and, ultimately, the second pole of Danny's Octopus investigation: the man we're calling Clark Gable.

We're calling him Gable for two reasons: first, because those among Danny's friends who met this mysterious figure when he flew into D.C., to warn Danny his life was in danger, invariably describe him as "looking just like Clark Gable, only without the big ears," and, second, because his real name is Robert Booth Nichols, and there already is a Nichols (Dr. John, no relation) in this story.

The circumstances in which Riconosciuto and Gable met are in dispute. But it seems that for a time they planned some R&D ventures for high-tech hardware behind the shield of the Cabazons' sovereign status. Gable admits to being the head of a holding company, one of whose subsidiaries has licenses on the prototype for an automatic weapon. But he won't say much more about his business. When I finally reached him at a California number I'd found in Danny's notes, he denied any involvement in improper activities. He told me his falling-out with Riconoseiuto began at the reservation when he caught the selfstyled scientist in "lies" about his esoteric inventions. He blames Riconosciuto and others who have been "Michaelized" for peddling dark tales about him. He hedged when I asked him about intelligence-world connections. "I have been involved in sensitive activities. That's the only way I can describe it," he said. And while he denied being in the C.I.A., he said he'd "been involved with a lot of people who tell me they are in the C.I.A., although I have no way of substantiating it."

What is certain is that Michael Riconosciuto has it in for Gable, and that he began pointing Danny in Gable's direction, filling his head with allegations of Gable's sinister, international covertworld connections. Indeed, he began to paint a picture of Gable that linked him to very big, very dangerous organizedcrime syndicates, including the feared Japanese Yakuza and the fearsome Gambino crime family of John Gotti. That linked him in addition to various C.I.A. and British intelligence plots, because Gable was the friend of a legendary Bond-ish Brit known as "Double Deuce." (Are you beginning to get a feel for the texture of Danny Casolaro's world by now?)

In fact, Riconosciuto attempted to convince Danny, with some success for a while, that this man Gable was the key to what Danny was starting to call the Octopus.

According to an ex-F.B.I. man who was a source for Danny in his final weeks, Danny began rashly and unwisely calling Gable himself about these allegations. "Danny began getting into areas that were dangerous, very dangerous," the ex-F.B.I. guy told me. "This is dangerous work. He was warned. You know. Gable warned him."

warned him."

If they ever make a movie of the INSLAW suit, it could be called Mr. and Mrs. Smith Go to Washington and Meet Franz Kafka.

A VISIT FROM CLARK GABLE

I have the details of the strange encounters between Danny and Gable from three different sources, none of whom was eager to be the sole source.

Because all recalled them as chilling. The exotic quality of those meetings is captured by one of Danny's friends, who had lunch with Danny and Clark Gable. Gable had flown into Washington, D.C., on a weekend about a month before Danny's death, was staying at the top-bracket Four Seasons Hotel in Georgetown, and seemed to have little business other than to spend time with Danny Casolaro.

The friend, a well-connected player in Pacific Rim politics who requested that his name be withheld, said Gable was "very slick, very civilized-appearing. Danny used to say he had the manners of a gentleman, but underneath he was a thug."

The friend recalls Gable "doing that thing that guys do on barstools the world over. He looks at you with that wink and says, 'You know, I'm not in the C.I.A.' "

When the three of them finally sat down to lunch at Clyde's in Tyson's Comer, the friend says, Gable promptly informed them he'd "just taped a radio broadcast as the incoming minister of state security in Dominica, and was preparing a coup that 'some bimbo in the C.I.A.' was asking him about. But he was actually at a higher level than the 'bimbo.' " (The island of Dominica, which figures heavily in Danny's notes, is an impoverished flyspeck in the Caribbean that has been characterized as "the Third World's Third World." Gable says he was asked by the leader of the opposition party on the island if he'd become security minister, should an election bring it to power; he says he cleared this with the State and Justice departments. He also denies any C.I.A. coup plot and says the broadcast was an interview about economic development.)

Danny's friend says he "never witnessed a performance" like the one that ensued. "[Gable] had this story that they were going to turn Dominica into a C.I.A. base, had plans for a desalination program, and pulled out this design drawn by a French architect of a dome the size of Texas Stadium that was half underwater. Really, the whole thing reminded me of Ernst Stavro Blofeld [the Bond villain], I mean, good Lord, you could just see James Bond swimming out there with a babe. I excused myself at this point. I really didn't want to hear anything more after seeing Blofeld's underwater lair."

"Did he come across as a con man?" I asked Danny's friend.

"It's funny," he said. "It was like he was real slick, really like Clark Gable, and there were nuggets of truth. The guy just oozes intrigue." (Gable told me he was exploring plans for exploiting the island's heavy rainfall to export purified water, and denies anything improper about it.)

Then, the friend says, Danny showed him a side of Gable he didn't want to know about.

"After lunch Danny pulls me aside and pulls out this purported F.B.I. wiretap summary on [Gable], and it showed how [Gable] is connected. It linked him to the Yakuza and to the Gambinos as a money launderer. And that widened my eyes. I said, 'Danny, I'm gonna take you out back and whip your ass! You just put me in a meeting with this man and didn't tell me what the hell—why didn't you tell me before?' And Danny was kind of, 'Oh, I don't know. I wanted to see how [Gable] would react.' In other words, he gaffed me with a hook and tossed me in the water to see if the Octopus would move!"

Gable says the suggestion that he's involved with the Yakuza and the Gambinos is "totally false." It's "absolutely ridiculous" to link him to "the Gambia family," he told me, conspicuously mispronouncing the name. He traces the trouble to an F.B.I. misunderstanding of his screenplay career. He says he was introduced to a high-level executive of MCA several years ago at a coffee shop. When the MCA man encouraged him to turn some tales he'd told him into screenplays, they became friends and, briefly, business associates. Unknown to him, the MCA man was the subject of a full-court-press F.B.I. investigation for being a key organized-crime link to the entertainment industry. And so, Gable says, his voice was picked up by taps on the MCA man's phone. The bureau misinterpreted their conversations as containing code words for illegal activities, turned around, targeted him, and slandered him to his business associates. In fact, Gable's company is suing an F.B.I. man for libel and slander. He says that the wiretap summary was part of the F.B.I. man's affidavit in the Gable slander suit.

In addition to the dispute over the wiretap affidavit, there's also a dispute over the nature of the warning Gable gave Danny. Riconosciuto, who wasn't there, tries to portray it as a personal threat from Gable. But others recall that it was Gable warning Danny against Riconosciuto.

Danny's girlfriend Wendy Weaver, for instance, spent a long, strange evening with Danny and Gable and has an indelible memory of the warning.

"It was a weird night, so weird," she recalls. "We met at the Four Seasons [bar]. He was pretty well lit when we got there. He was very charming, very handsome. When I tried to find out who he really was, he really didn't give me an answer. He just started these warnings. ... He kept saying, 'You don't know how bad this guy Riconosciuto is. Tell Danny to stay away.' He said, 'Riconosciuto—he might not get you today, he might not get you next month. He might get you two years from now. If you say anything against him he will kill you.' "

He repeated it several times, Wendy says. "At least five times."

Later in the evening, Wendy reports, there was a heated altercation with "this

The only thing his two chief sources agree on is this: Danny was murdered. And each implies the other may well have had something to do with it

Asian-looking guy, who apparently insulted me in some way. And Danny was scared. After we got rid of [Gable], Danny goes, 'Wendy, this guy is scary.' That's the first I heard him say that."

While Gable was trying to warn Danny about Riconosciuto, Riconosciuto, for his part, was desperately trying to warn Danny about Gable. Or so he says. "I was absolutely frantic trying to warn him," Riconosciuto told me.

It was Danny's habit of "bouncing" Riconosciuto's stories off Gable that put him in peril, Riconosciuto says. One of the things he was supposedly "bouncing" involved what Riconosciuto said was a major heroin-related sting. (Gable denies any involvement in drug traffic. "I hate narcotics," he told me.) Another involved Riconosciuto's claims about an effort by the Cali cocaine cartel to derail the extradition of an alleged Colombian kingpin called Gilberto.

Gable just "went ballistic," Riconosciuto says, when Danny bounced this Gilberto matter off him. "But by the time I heard about it, there was nothing I could do, you know, except to warn Danny.

"And I called from that day on—it was on a late Monday—Tuesday, Wednesday, all the way through the weekend when they found Danny. Every day I was calling the Hamiltons, asking if anybody had heard from Danny. And I was frantic."

What was going on in Danny's head as he was being whipsawed between these two shadowy operators and their death warnings?

There was one point in my immersion in Danny's mental world when I felt a flash—a brief, chilling, but illuminating flash of what it must have been like for him when he got in too deep. It came in the course of a phone conversation I had with Ann Klenk, who was not only one of Danny's oldest and closest friends but also the one whose skeptical perspective on his obsession I'd come to rely upon.

She was telling me of her surprise and puzzlement over something she'd just learned: that not long before his death Danny had approached a nurse he knew and questioned her closely about the symptoms of multiple sclerosis and brain diseases.

This was particularly pertinent to the murder-or-suicide question, because an autopsy examination of Danny's brain revealed possible symptoms of M.S. Initially, his friends and family had dismissed this as irrelevant—it couldn't be a motive for suicide, because Danny had never complained of symptoms or, to their knowledge, known of the disease.

Then I mentioned to Ann the cryptic notes I'd found in Danny's files: on germ warfare, on slow-acting brain viruses like Mad Cow Disease, about targeting people with them by slipping them into meat pies.

That's when it struck me. "Oh, God," I said to Ann, "Danny's asking a nurse about brain disease—maybe he thought he'd been targeted."

Had he gone that far, or was / now too far gone down the road to paranoia that he'd traveled?

A few days later, I happened to mention the report of Danny's seeking information about brain-disease symptoms to Michael Riconosciuto. Who promptly said, "Oh, yes. He, uh, was concerned. And that was one of the reasons he had such an obsession [with this story]. Because he felt he had been hit by these people."

"Hit by them?"

"He confided this to me to try to get me to talk further" about biologicalwarfare projects he'd discovered, Riconosciuto explained. He'd been warning Danny that he wasn't appreciating the danger his investigation was exposing him to. "I told him, 'You can't envision your own death. Why would you want to do this [kind of reporting]?' And he finally came out and said, 'I'm going to die anyway and... I want to go out in a blaze of glory and take them with me.' "

What did he mean, he was going to die anyway? I asked Riconosciuto.

"He suspected that he had been, you know...a source told him that he, among others, had been targeted with this sort of [slow-acting virus] thing."

This was too much even for Riconosciuto. "I told Danny, 'Look, the paranoia will consume you. You need to go and get tests.' And Danny went and got tests and they were inconclusive. Now, what he probably had was the genesis of a naturally occurring ailment."

The paranoia will consume you. This exchange marks the moment when Danny's conspiracy-obsessed imagination surpassed even that of his most inventive source. In fact, the definition of true paranoia might be the point where Michael Riconosciuto says you're too paranoid for him.

And yet, there's something in Danny's reported remark that caught my attention: Riconosciuto's recollection of Danny's saying, I want to go out in a blaze of glory.

Certainly, as it turned out, Danny went out in a blaze of publicity. The networks, the magazines, the mainstream reporters who had given him the brushoff in the weeks before he died, gave him star treatment as a corpse. ABC's Nightline and CNN assigned swAT-team investigative squads to follow the leads in his notes. He couldn't have had it better if it had been scripted.

Could he have scripted it?

More than anything, it's the conspicuous theatricality of Danny's behavior in the last ten days of his life—when he suddenly went into his "I've cracked the whole case" mode—that led me to reluctantly revive consideration of what might be called "the Gatsby scenario": that his death was a final act of selfcreation.

What ultimately led me back to the Gatsby scenario was the inadequacy of both the case for murder and the case for simple suicide.

One can certainly understand why almost every one of Danny's friends and family leans toward the murder theory. (His mother's first reaction when she heard the news: "They've killed him!") They knew he'd been getting warnings. They knew he'd been getting threatening phone calls. On the Monday before the Saturday he died, he told his brother, "I'm getting these strange phone calls saying, 'You're gonna die.' " Also that week, shortly before he left on the fatal journey to that West Virginia motel, the neighbor who looked after his house reported answering Danny's phone and hearing a voice saying, "You're dead." She reports a similar "You're dead, you son of a bitch" call hours after his body was found—which rules out Danny himself as a possible source of the alleged threats against him.

And then there was the unmistakably clear—at least on the surface—prophecy to his brother: If anything happens to me it won't be an accident.

With admirable dedication, Danny's younger brother Dr. Tony Casolaro has made it his mission to ensure that there is any truth to this he will make certain it gets out. Which has resulted in this soft-spoken, reserved specialist in pulmonary medicine—quite the opposite of the extroverted, gung ho party dude Danny was—plunging into his dead brother's world.

He's talked to Clark Gable. He's even taken collect calls from Michael Riconosciuto in which Danny's jailbird Svengali spun out his "fentanyl" theory: that Danny was immobilized by the powerful synthetic heroin-like drug fentanyl, and then, in a state of compliant, semi-paralyzed alertness, was forced to cut his own wrists.

After spending weeks on his brother's case, Tony Casolaro is tom. He can't believe it's suicide, because his brother was so excited and upbeat about his investigation on that last Monday he saw him.

Tony is also troubled by a number of facts. Papers and files Danny had been seen with up in West Virginia were missing from his motel room. Stolen by his murderers? (Of course, if Danny wanted to create doubt he could have made a point of "disappearing" the papers before killing himself.) Then there are the still-unexplained phone calls from people who seemed familiar with the implications of Danny's death before even the police knew. There was the hasty embalming, the cursory look at the death scene by the cops, who made an initial judgment of suicide. (The reinvigorated Martinsburg police investigation—

ongoing as of this writing—has been far more thorough, but perhaps too late.)

But, on the other hand, Tony knows the actual scenario for murder is "kind of Tom Clancy-ish. "

"The way I envision it could have happened," Tony told me over dinner one night in downtown Washington, D.C., "someone stands over him and says, 'You write this suicide note or my partner who's standing with your son will, you know, [kill your son].' And Danny would just go, 'Fine.' "

Danny was a big, tough guy, a boxer, fearless, Tony says. But if he felt his son's life was being threatened, "he wouldn't be someone who would resist that kind of pressure."

Having written the suicide note, this murder scenario goes, Danny would then have run the bath, gotten undressed, gotten in, and started carving up his wrists with the blade his captors provided him.

The reason his friends and family, all solid-citizen types, could believe in such a farfetched scenario is precisely that Danny made such a big point of telling each of them in the week before his death that he was on the verge—or over the verge—of the big breakthrough he'd been looking for. That he was about to go to West Virginia to "wrap it up," to get the final piece of the puzzle, to nail it once and for all. He told one friend he was going to West Virginia "to meet the head of the Octopus." He told another he was going to West Virginia to "bring back the head of the Octopus."

Riconosciuto was reluctant to talk about the germ-warfare leads. "Anybody who's ever come near it has gotten killed."

The exact nature of the breakthrough he was trumpeting seemed to vary. He told three people he had finally solved the whole insanely complicated INSLAW mystery. He gave two other friends the impression that he'd gotten the goods on the October Surprise case and linked it to B.C.C.I. He told a source he met in West Virginia that he'd just "gotten enough information on B.C.C.I. to hang Clark Clifford." He went through an elaborate charade with the two friends — showing them a key document that he said tied it all up. The document was a photocopy of a $4 million check signed by Adnan Khashoggi, the Saudi arms dealer who's been linked to Iran-contra. The check, copies of which I found in his files, is made out to Manucher Ghorbanifar, the shadowy Iranian exile arms dealer who played a mysterious role in the Iran-contra deal.

"He was really excited when he got that," Danny's friend Ben Mason told me. "It was like, 'This is it!' "

Was this the magic document/smoking gun of the whole October Surprise/ B.C.C.I. /Iran-contra mega-conspiracy ?
